M. N. Plombeur, Liège (146, p. 1156). Best guns, rifles, and pistols, of faoltless manufacture. M. RENRIN, BROTHERS, Liège (141, p. 1156). Numerous collection of sporting and ornamental guns, M. H. Torraxy, Lège (155, p. 1156). An ornamental double gun, the master-piece of a guu-maker; guns and arms of excellent workmaship.

Honoorable Mention is necorded to the following:-Falisse and Traphann (154, p. 1156), for specimens of military fire-arms; collection of nipples, L. MALHERBE (147, p. 1156), for collection of orna-

mental and sporting guns,

J. THONET (144, p. 1156), for a double gun, J. M. TINLOT (152, p. 1156), for a double gun.

France

The Prize Medal has been awarded to the following M. HERTONNET, Paris (58, p. 1174). Sporting guns nd nrms, carefully executed M. P. CLAUDIN, Poris (1057), Best guns, rifles, and pistols, of faultless execution

M. DEVESNE (166, p. 1181). Sporting guns and arms, executed remarkably for taste and goodness of workman-M. Gastinne-Renette (1611, p. 125), bines, and pistols, of very good workmanship.

M. Gauvain, Paris (1612, p. 1254), Pistols, admirable

in form and execution; sporting guns of excellent qualit M. H. HOULLINE BLANCHARD, Paris (1628, p. 1255).

Pair of pistols, with necessories, chased and encrusted with gold, with a case richly sculptured, in boxwood, showing an extraordinary degree of perfection in work-M. LEOFOLD BERNARD, Paris (1547, p. 1250). Double and single-barrelled guns of beautiful damask, and of

excellent workmanship throughout, M. LEPAGE-MOUTIER, Paris (1364, p. 1241). Sporting guns, of excellent quality, ornamental gons of exite workmanship, swords and side-arms of the Due de Luvne's damask, of remarkable unvelty; bucklers and objects of art.

The under-mentioned have received Honourable Men-M. F. BERGER, St. Etienne (418, p. 1198). Fancy fowl-

ing pieces, of various kinds, of excellent workmanship.
M. B. Bentnoer, Paris (1546, p. 1250), for good fowling-pieces,
M. Albert Bernard (1075, p. 1229). Excellent Damasens gup and pistol barrels.

M. Delacora (1582, p. 1252). Swords and sabres, imitated from various countries, &co M. PRELAT, Paris (1681, p. 1257). For collection of pistols, ornamented.

Z.llverein. Prize Medals are bestowed on the following:-Messrs, A. and E. Hollen, of Soliogen (637, p. 1083), Large and varied collection of swords, blades, and side-

arms, of great excellence, M. CARL AUGUST FISCHER, Lübsck (5, p. 1141). Doublebarrelled rifles and fowling-pieces. The under-noted exhibitors are Honography Nex-

tioned:-SCHNITZLER and KIRSCHBAUM, Solingen (480, p. 1078). Infantry and cavairy swords, &c.
Schwolz, Wh., and Co.*, Solingen and Berlin (673, p. 1087). Collection if swords.
W. and G. Pisron (481, p. 1078), for a rifle for carry-

ing pointed balls.

M. C. V. HEINLEIN, Bamberg, Bavaria (20, p. 1099).

A ride, carved and ornamented in the old German style.

J. A. KUCHENBEUTER (21, p. 1099), for pismbs.

MM. WERER and SCHULTHEIS, Frank fort-on-the-Maine , p. 1121). Single and dooble-barrelled rifles. M. I. Schmipr, Mecklenburg-Schwerin (2, p. 1134).

Guns of good workmanship,

Don E. ZELOAGA, of Madrid (264a, p. 1346), is re-

warded with the Prize Medal for his fire-arms and pistols, most magnificently chased, engraved, and incrusted with gold ornaments of very graceful designs. ROYAL MANUFACTORY of TOLKDO (266, p. 1346) is hunnarably noticed for sward cuttery, richly ornamented, Switzerland.

M. V. SAUERBREY, of Bayle (68, pp. 1270, 1271), ob-. These exhibitors have been awarded Prize Medals by the Jury of Class XXI., in whose list their names appear.

tains a Prize Medal for a large rifle, mounted, fitted, and furnished in the most perfect manner. Honourable Mention is made of-

M. JEANNET, of Locie, Canton of Nenfchâtel (5, p. 1265), for n rife with steel harrel. M. Fischer, of Chur (265, p. 1283), for a double American ritle.

J. Vannon (69, p. 1271). Target rifle.

C. TENTS

A Prize Medal is given to Mr. B. Engingros (302, pp. 359, 360) for the tents exhibited by him. One is 12 feet by 8, with poles 6 feet high, proposed for officers or emigrants. Another is for troops, travellers, or emigrants, 12 feet square, sapported ou one coatre pole, like the round tent of the British service; but its figure is a pyramid, instead of being a coae. The angles are pyramid, instead to bring a cone. The angree are strengthened from the head of the tent by 1-ineh tarred rope, to which the canvass is boltest, and which, being secured to strong pegs in the ground, constitutes the principal support of the tent. In the middle of two oposite sides a sort of porch is formed, sustained by a light 6-foot pole, giving entrance to the tent, and affording the great advantage of a thorough draught of air. It is also ventilated at the top, and the orifices secured against the entrance of rain. The centre pole, which is 9 feet 10 inches long, divides into three parts, the small ones into two, and the whole packs into a value 40 inches lung, by about 13 inches in diameter, the weight of which is 864 lbs. The two porches and the very complete wentla-tion they afford are improvements of great value, parti-cularly for the sick, when the large hospital tents are not carried

Mr. Edgington proposes, for military use, to employ bleached canvass, and to tan it, for preservation from mildew, a measure deserving of consideration. To his larger tent he has attached a portable stove and cooking apparatus, well adapted and arranged for the use of emi grants, but not so portable as necessary for military service.

D. DEPENSIVE ARMS.

A Prize Medal is given to M. Faten Kaupp (677° p. 1087), of Essen, for having exhibited a cuirass of German native cast steel, the material of which is so much improved by manufacture as to attain a high de-gree of resistance to the balls of fire-arms, though it bas not yet been determined whether this resistance exceeds that which would be afforded by east steel made from eemented steel. M. Krupp's success, however, is deserving of reward.

PART III

MILITARY, NAVAL, AND OTHER MAPS. This Jury has been charged with the care of examining the various kinds of maps executed in consequence of surveys made for naval, military, or geological porposes.

The Council Medal is awarded to the Annialty of GREAT BRITAIN (p. 344), under whose superintendence and directions accurate surveys have been executed, aut only of the cossts and ports of the three kingdoms, but

of the coasts of the greatest part of the globe. Drawings of great accuracy are executed, according to these surveys, by the Hydrographical Board under Admiral Beaufort. Afterwards, maps confined to the indications that are indispensable for navigation are published nad sold at a very cheap rate to the officers of the merchant service.

It is anderstood that the Council Medal granted to the Admiralty for models and improvements in ship-huilding, with the combination of the forces of wind and steam, -and for the improvements of the azimuth compass,-shall be united with the same award for the pass,—shall be united with the same awaru for the eminent services rendered by the surveys, calculations, drawings, and publication of bydrographic maps, under the direction of the learned and liberal Hydrographical Department of the Admiralty.

* This exhibitor was awarded a Council Medal by the Jury of Clars I , in whose list his name appears.

French Department.- The science and practice of hydrography owe much to France, having been brought in perfection by the celebrated Beautemps Beaupré. drographic maps were andertaken from surveys made by the celebrated hydrographer, M. Beantemps Beanpré, in the time of the Emperor Napoleon, along the coast of Flanders. For thirty-five years afterwards that undertaking was continued along the French coasts of the ocean, and the Mediterranean, including Corsica and Algeria. The French survey presents the most complete escription of the shores, and of the ground under water, for a great distance, with the configuration of any existing danger. The calculations were carried on, as exsuing magger. The calculations were carried on, as well as the survey, with the lieft of the hydrographers staff, under the direction of M. Beautemps Beaupee, and with the attemst precision; the drawings, as well as the engravings, are worthy of this notice. It was in this way that the magnificent Atlas, or "Neptune of the Cayasts of Prancy," was produced, the fluxest specimens Coasts of France," was produced, the fittest specimens of which have been presented to the Exhibition.

The Council Medal to be delivered to the Dirior Gif-

NEBAL DE LA MARINE (128, p. 1177, France) in Paris, as an acknowledgment of the scientific labours evinced in the hydrographic surveys of France, and also of those of M. Beautemps Beaupre, and the engineers associated with him

M C. E. Collin (426, p. 1177), the engraver of the Hydrographic Dipôt of France, has exhibited maps in his own name, very remarkable for the skilfulness and necuracy of their execution. The Prize Medal is granted

The Ordnance Department of Great Britain, having the command and direction of the scientific bodies of artiflery and military eaglacers, was, very properly, charged with all the operations necessary for the survey, calculations, and drawings of the land map of the three kingdoms. This yeat enterprise is now in a state of great forwardness, and is one of the scientific monnments most worthy of the British aution. For the copperplate etchings, and for the use of electrotype process in reproducing the plates, our culogium is justly due to the establishment at Southampton, where they are exe-

The Council Medal is granted to the OADNANCE DEPARTMENT (128, pp. 341, 342), who exhibited the maps, as a just and honourable tribute to the meritorious and scientific officers of that department who prepared

A map of England and Wales, engraved by himself, is exhibited by Mr. Curculey (74, p. 541). The map is on a scale of half an inch per mile.

The French Minister at War has presented numerous sheets of the aew map of France.

The French map of Cassini was as perfect and comlete as such an undertaking, by a single person, could plete as such an undertaking, by a single person, be: this map already more than a century old, so longer represents the superficies of a country in which such euormous changes have taken place. As early as 1816 a scientific commission, under the presidency of the illustrious Laplace, planned the undertaking of a new and improved map of France; combining the most precise astronomical observations with an accurate general triangulation. Two parallel lines were measured, the one from Brest to Hungary, through Strasbourg; the other, following upon the globe the parallele mayer, was carried to the south of France, and continued through Italy to Finme. These lines, accurately ca culated, spread new

light upon the figure of the earth In the French map each place of importance is given with three elements, necessary to determine its complete geometrical position, the longitude, the latitude, and the

altitude above the level of the sea,

The operations were at first executed by the body of Military Geographers; but this body having been united to the Corps Royal d'Etat Major, they continued, under a new title, their scientific andertakings; some of them going spon the ground, each summer, and returning to the Dépôt de la Guerre, to complete the calculations, and execute the drawings.

The man of France is justly admired for the beauty of

lines, which prevents all confusion to the eye, and gives the best idea of the form of the ground,*

The Council Medal is granted to the Deport DE LA GUERRE (804, p. 1219), in Paris, for the scientific body employed in executing the land map of France. Austria has presented maps of Italy and of the Duchy of Austria, equal to the best of England and France. Iudeed, the maps of Italy were undertaken by the Freuch

wheo they were possessors of that peninsula.

The Council Medal is granted to the Military Geo-onaphical Institute (363, p. 1028, Austria), Vienna,

which presents the maps, Geological Maps.-Some years ago, Mr. Greenough, a distinguished geologist, executed a geological map of England upon a scale not larger than that of France, Sir Henry De la Beche had the courage to undertake a new geological map upon the great scale of an inch per mile. This large size rendered it possible to add scientific information in the ordinary map, to present in great de-tail the cature of the stratifications, to apply his map to agricultural, metallurgical, and mining studies, and to give the delineation of the metalliferous and other veins, Sir Heury De la Beche, alone, executed the geological maps for Corawall, Devonshire, and a part of Glamorgamshire. An official corps des mines was subsequently created, under the direction of Sir Henry De la Beche, with the name of "Geological Survey," which directed and ecotioned the great geological survey of the three kingdoms. Sir Henry De la Beche being the super-intendent of Jury I., 'to whom this subject naturally belongs, the adjudication on the marits of the geological

The Council Model The Council Medal is given to the Gentoutcat Sta-ver (159, Class I., p. 137), is honour of the excellence of the work and of the staff of officers charged with the execution of the map, under the direction of Sir Henry

Du la Bacha + De la Becne.7.

The geological map of France, a public underinking, has been executed by the "Corps National des Mines," and we oust add, principally, by two members of the lustitute of France, both General Iospectors of this body, MM. Dufrenoy and Elie de Beaumont, M. Dufrenoy, one of our French Jurors, was charged with the north-castern part, and M. Elic de Beaumont with the southwestern part, and st. fare we remained what the sound western part of France. Both employed thirteen years in exploring the ground, and four years is the labour of the cabinet, as well as in the classification of more than 30,000 specimens of minerals which they collected in their local investigations, for which they travelled more than 40,000 miles on foot.

The French geological map, executed on a scale of hith, is an excellent reduction of the great official map dering the great importance of such a scientific undertaking, granted their quinquennial Wollaston Medal to

its authors. The Conneil Medal is granted to the ECOLE DES MINES. in honour of the Corps National des Mines, whose en-

seer executed the map of France. M. DE RÉNEMEUL, the ingeoious foreman of the Lithographic National Press of France, was the invastor of the excellent process for colouring maps. He deserves the Prize Medal now granted to him,

The priocipal geological maps were coloured by the hand, but the chef de la lithographie at the National Press at Paris, has discovered so simple and ingenious a pro-ceeding for eolouring with the press, that all is done now by machine process. So perfect, indeed, is the operation, at, with a magnifying-glass, the colours are seco to follow rigorously the lines forming the limits angraved

the engraving, and the system of etching, hy horizontal upon the map; and in on part do the colours exceed or remain behind that limit.

DUPIN, REPORTER, Paris, November 1851.

APPENDIX. Sureneer Cove 9

The articles belonging to this Class, recently sent from

Sweden, comprise-1. A cust-iron shell-gun, of 8 9 inches calibre (Euglish), and 9 feet 6 inches long, made on the construction of Barou M, you WAHRENDORFF, to load at the breech, and mounted on a carriage and slide, also of cast iron, adapted to a casemate. The gun is io weight 9,671 lbs. Swedish (Victualie Vigt), or 81 cwt. 0 qr. 4 lbs, English, and is marked Aker, 1850, No. 4. The charge and weight of projectile are not stored, but the gun is understood to be intended for spherical projectiles, and is not rifled,

the intended he specified projections, and a not intended he specified proportions, the solid shot would weigh about 94 lbs., and the shell 70 lbs.

2. A cast-iron Swedish 6-pounder field-guo, 5 feet 54 inches long, and in weight 856 lbs. Swedish, V. V., and to 7 weight 7 weight (64 lbs.) equal to 7 cwt. 0 qr. 19 lbs. English.

3. A Danish 6-pounder field-gun, also of cast iron

5 feet 34 inches long, and in weight 931 lbs. Swedish V. V., equal to 7 cwt, 3 qrs, 6 lbs. English, Both these guns are from the iron-works of Aker, and bear the date of 1851

4. Two models of 12-ponoder and 6-pounder field guns, with limbers and ammunition-boxes, &c., complete, on a scale of one-eighth,

scale of one-eightn.

5. Lastly, the model of a 30-pounder long gun, on a carriage and slide of wood, for easemates, also on a scale of opposite hth

Shell-Gan.-The chief condition on which this gun has been constructed (next to that of loading at the breech), appears to be that its recoil should limited, and that it should not require to be run up. is accordingly mounted on a cast-iron earriage and slide well suited to those conditions, and of ingenious construction, traversing on a pivot placed about 18 inches in front of the head of the slide, and therefore in the throat of the embrasure. The axis of the gun is four feet from the ground, and the total length of slide from its head to its extremity (being the distance it would occupy in a easemate), is rather less than 10 feet, or from the pivot 11 feet 6 ioches. The extreme brendth of carriage and slide is in front 2 feet 104 inches, and in rear 3 feet 2 inches.

The weight of the carriage is 5,215 lbs. Swedish V. V., or 43 cwt. 2 qrs. 12 lbs. Eaglish, and thot of the slide 3,537 Swedish V. V., or 29 cwt. 2 qrs. 6 lbs. Eaglish The gnn and carriage together being 124 cwt. 2 qrs, 16 lbs.

English.

Though not requiring to be run np, the gun is not oo n non-recoil principle, the slide being so constructed as to admit of a motion of the guo and carriage when fired, of obout 3 feet 6 inches, which at first is horizontal, and then for about 3 feet on an inclination upwards of 1247 by means of which the force of recoil (the weight moved e 64 tops oearly) is gradually resisted and overcome. be 64 to one ocenty) is gradually reinsted and overcome. From the point to which the gun and carriage is thus raised, it desecods by its own weight, and, after a few inches horizontal motive, is received by one elastic cushion, formed of aftects of hirch bark, placed vertically, and therefore perpedicularly to the direction of the force, making a hiskness of 9 inches. By this cushion all the remaining motion is absorbed. The angle of resistance of cast-iroo on cast-iron being about 94°, and the motion of the descent ending horizontally, the impression on the cushion is rendered moderate, and all shock is avoided. The surfaces or bearing points, on which the carriage rests upon the slide, are eylindric, of about 34 inches radius.

A carriage and slide of the same description as that exhibited, but enrrying a 32-pounder gun of Baron Wahrendorff's construction, was tried at Shochury Ness,

Already 145 sheets are published, 63 are in the hands of the engravers, 52 more will conclude the work; so that it the engravers, 52 more will conclude the work; so that it will present 290 attas sherts when complete.

† The "Museum of Practical Geology" possesses rish and usique mineral collections, furnished by the three kingdoms, and put in the most excellent order by Sir Henry De is Brebe, who opened the lustifution to the public shortly after the opening of the Great Exhibition.

The subjects introduced in this Appendix arrived after the dispersion of the Jury of Class VIII.

in 1850, with 30 rounds, at 52, 102, nod 152, and stood perfectly well. It is, however, probable, that the motion of so great a weight, on surfaces of very limited extent, would, in time, cause the latter to become disintegrated, and to require renewal.

Altogether the arrangement of the carriage and slide, apart from the consideration of the material, and the strong objections to it which exist, is very ingenious; but its value is obviously entirely dependant on the question to which it is subordinate-whether or not there is any advantage in loading at the breech

On this point a very decided opinion has been formed in this country. In 1842, trials took place of two 24-pounder guas of Baron Wahrendorff's construction, similar to that exhibited before the Select Committee at Woolwich, and on board Her Mujesty's ship "Excellent at Portsmouth; the result of which was the opinion that there would be no advaotage in adopting such a gun into Her Majesty's service.

More recently, in 1850, the trial above mentioned, of a 32-pounder gun of Barou Wahrendorff took place, fol-lowed by an extended trial of another 52-pounder to load at the breech, proposed by Major Cavalli, of the Santiminn Artillery, and constructed at the works of Baron Wahrendorff, in Sweden, from whose method it differs in the mode of closing the breech by a flat, instead of a cylindric plug, transverse to the axis; in being rifled, and in carrying a hollow projectile of a cylindro-conical figure of 64 lbs. weight, or double that of the round shot of the same calibre. Major Chvalli's carriage and slide, like that of Wahrendorl's, were both of iron, but differed from one another in some details not necessary here to The views of Major Cavalli are fully explained in his

" Memoire sur les Canons se chargeant par la culasse, et sur les Canons rayés," published in Paris, 1849. After a long course of experiments at Shoebury Ness, in 1850, with a gun of his construction, which showed by the increase in the weight of the projectile a very considerable increase of range might be obtained, but no other soaterial advantage, the experiment came to an end by the whole breech of the gun flying off in one piece, giving way at the passage of the transverse plug by the explosion of the charge. In reference to this result, it should be observed, that the construction of Wahrendorff has greater solidity, and is superior in strength to that of Cavalli

The Committee, after giving the whole subject a very careful consideration, adhered to the opinion expressed in 1842 on Baron Wahrendorff's 24-pounders; and with

reference to those of Major Cavalli, they came to the conclusion that gams loading at the breech cannot be considered safe, and that those in question were in their essential qualities " greatly below the ordinary guas of the service

It appears, however, that in Sweden, Baron Wahrendorff's construction has to a certain extent been adopted; and that the fortress of the island of Waxholm, which forms one of the defences of the approach to Stockholm, is arneed with guas in casemates, similar in all respects

to that sent to the Exhibition.

Without doubt, then, the Swedish artillery must have become satisfied that this construction possesses advantages over that in ordinary use. Yet it is not evident in what these consist, more particularly when, apart from the question of the resistance of the material, so great a danger is always present as the possibility that the breech has not been securely closed. To ensure this operation in the heat of action must demand great care and attention, for which time is necessary; and it would seem to be requisite that it should be performed by the man who Looking at all the operations to be performed, it fires. does not appear likely that any material advantage can be gained as to rapidity of fire. And in respect to the number of men required, they cannot well (making no allowance for relief) be less than three per gun, a number which is sufficient to keep to action a gun of the ordinary construction, and of similar weight.

Upon the whole, admitting the arrangements by which Baron Wahrendorff closes and opens the bore to be most ingenious, they undoubtedly render the gun to which

they are adapted much more liable to derangement and rruption than can happen to those usually employed. And since the effect of heavy artillery depends infinitely more on precision than on rapidity of fire, it would clearly be preferable, supposing (which, however is not appn rent) that there is an advantage in facility of service, to number of the guns, rather than to rely upon a me-chanism liable to be put out of order, and that possibly may thus become fatal to those who use it.

In material, Sweden possesses advantages in the great strength and resistance in the cast iron produced from the pure and rich mineral, smelted by wood charcoal, that she employs, which no other country can command; and were we in England to attempt, with the cast iron from the coal formation, the same forms and dimensions as those employed in Sweden, we should, without doubt, encounter still more frequently the same result as attended the trial of Cavalli's gun.

This observation does not, however, in any way detract from the merit of Harou Wahrendorff's constructions sent to the Exhibition, which must be admitted to be of great ingenuity and interest; and taking it for grunted that his guns have been submitted in Sweden to trials that have proved satisfactory, they solve an important problem.

Whether, however, these constructions, and that of the gun in particular on which they are dependant, are such

as may be generally and advantageously applied, is another question, into which it does not seem necessary further to inquire.

No drawing or papers have been transmitted to show the construction of the ensumnts and embrasure in which the gun is mounted, but it may be presamed that they resemble, more or less, those of Cavalli's system.

Iron Field-Guns.—The Swedish and Danish cast-iron

field-gons are excellent samples of those which are employed in their respective services, in which they are preferred to brass, and with good reason, so far as the more perfect preservation of the bore and consequent accuracy of fire, are concerned. The bore and vent, however, require to be carefully attended to and pro-tected from oxidation. The weight of the Swedish gun is a hundred-weight and a few pounds more than that of the English brass light six-pounder; but the former 57 inches longer, and the bore 16 inches larger than the Finglish gun. The shot is consequently beavier, and the English gun. The shot is consequently heavier, and the charge of 2 lbs. Swedish exceeds by 7 ounces that of the English gun, Cast-iron field-guns have been in use in the Swedish service since 1805, and recently their horse artiflery, who were armed with brass gans, have ex-changed them for iron.* There seems no reason to doubt that cast-iron field-

guns of so excellent a material as Sweden produces, may in many climates replace those of brass of the same weight; but within the tropics, and where they could not receive continued attention, the action of the atmosphere and of the sea-air would render them less durable

in the vent and cylinder than brass.

Models of Swedish Field-Guns.-These models, extremely well executed by BERGQUIST, an artist of Stockholm, exhibit in wood and iron, and in full detail, the psculiar construction of the Swedish field-artillery, as established in 1831. They show all the arrangements of the draught, and the method of attaching to the limber which gives a power of locking round, or of altering the direction of the march, of 80°. They are very deserving of attention

30-pounder Long Gan on a Carriage and Stide for Casemates. - This model, by the same artist, and on the same scale of one-eighth as above, is also very well executed, hnt presents no mechanical feature of importance. It is on a front pivot, and has ingenious mechanism for traversing by a small wheel and winch, within the bind trucks; but this refinement is not wanted, and there is altogether a character of complexity that does not properly belong to machines for military use. The gun appears to be 10 feet 2 inches long, and the whole length of slide is 14 feet 10 inches,

Associate. Sir Joseph Paxton, 36 Gloucester Place, Portman Square.

In endeavouring to fulfil the command of your Royal Highness, that each Reporter should describe, as to its general state, the brauch of industry which falls within his department, my task will lead me not to balance the claims of rival inventions, which are far better shown hy the results of the trials given in the words of my colleagues, nor yet to portray their construction, which can seagues, nor yet to portray their construction, which can hardly be conveyed in words, or even by drawings, but in state plainly, if I am able, the practical effect of agri-cultural machinery upon the soil or its products; and so, it may be, to further the designs of that Exhibition which your Royal Highness purposed not for a gorgeous spec-tacle only, but, as it has worked itself out, for a focus in which the various nations might combine and compare their scattered rays of realised knowledge.

As our implements are intended not to bring about new conditions of soil, nor to yield new products of any kind, but to do with more certainty and cheapness what had been done hitherto by employing the rude implements of former centuries, certainty and cheapness of action are evidently the standard by which their merits have to be tried, and chiefly the latter property, which forms the superiority of the spinning jenny over the distaff, namely,

The yearly shows and trials of the Royal Agricultural Society have certainly done more in England for agri-cultural mechanics in the last ten years than had been custural mechanics in the last ter years than had been attempted anywhere in all former time. Yet, though the inventions are many, they may be reduced to a few simple classes: in reviewing those classes, it will be most con-venient perhaps to follow the order of cultivation, begin-ning with the instruments of tillage, and, among these, with the plough.

I. INSTRUMENTS OF TILLAGE.

It was found about twelve years ago that in many parts of England ploughs drawn by four horses were still used, while in the same neighbourhood, or even parish, other ploughs were at work equally easy for two horses. The emnhrous plough, resting on a heavy gallows and wheels, had been adapted to the clay soils when those soils were the chief source of corn to the country, and had been handed down from father to son, after the heavy lands

had been widely laid down to grazing ground, and the former downs had become our principal arable land. Not only, however, did these obsolete monuments survive -it was also discovered by Mr. Handley, that the inventors of new ploughs, by rejecting the wheels as well as the gallows, had produced, especially in the north, a as the gallows, had produced, especially in the north, a plough which, burgh flushoushed mader the mane of plough which, burgh flushoushed mader the came of the plough which the plough of the plought of the medical control of the plought with two low briefs, and with model-burds adapted to different soils. Means, Howard indeed, which missing each else of earth (farrow slice, from its fat position gradually through an apright our, consecution of the plought of the plought of the control of the plought of the procured that covery and displayment. The true allowed procured both crowdy and displayment, The true allowed the procured both crowdy and displayment. is founded on mathematical laws, but, as in a somewhat similar case of displacement, that of water by the bow of u yacht, is doubtless best determined by actual trial. The test of perfection in the work of a plough is, that the furrow-slice shall lie, after being turned over, in a perfeetly straight line, not only unbroken, but even un-cracked. It is by patient attention to this point that Mr. Busby, with the aid of an excellent farmer, Mr. Outh-waite, produced the beautiful mould-boards of his prizeploughs. This unbroken furrow-slice requires some length of mould-board; and it is arged, on the other hand, in behalf of short monid-boards, that they pulverise the soil while they ture it over. Practical farmers, how-ever, know that to pulverise is not the immediate object of ploughing land; but as the length of the English of plonging tank; but as the length of the English mould-boards emprised foreigners, it may not be useless to state a further reason for that apparently excessive (longth. Ours also were, in fact, made short and hollow for our new ploughs, until at one of the Koyal Agricultural Society's trials all the selected ploughs were brought to a stand in attempting to work a strong clay. The cause of the fulture was this; the chief resistance to the horses in ploughing proceeds not from the weight of earth moved, which is insignificant, nor, unless the ground be unusually taked, from the act of severing the earth, but from two other causes, namely, friction, and ou certain soils still more from cohesion. Now, if the

soil contain sharp sand, there will be no cohesion; it will work freely off the mould-board, which will be kept bright, and the shorter its surface the less will the friction For such soils, therefore, as are common in Scotland short mould-hoards may be the best. But most English short unusld-boards may be the best. But most English soils contain so much chy as will adhere to and fill up the hollow of a short monid-board, so that the furrow-slice will have to work not upon an irom surface, but apon the unst disadvantageous of all surfaces, one of rough loam, and the draught may thus be easily doubted by friction and cohesion together. Hence, our English mould-boards have been very properly lengthened, the more properly, I suppose, because the same soil will mere often have to be worked in a moist state here than in continental Europe.* Many of the foreign ploughs, it should be said, behaved, under all disadvantages, exceedingly well, and were, no doubt, better suited than ours for their respective loca-

Ploughing, itself, is certainly a singular instance of great skill acquired by a body of men who scarcely, as was remarked by Lord Ashburton, receive the credit due to that skill. A good ploughman will set up a pole a marter of a mile distant or more, and keeping this mark. almost invisible, steadily in his view, will, ou land perfeetly smooth, trace up to that goal, until his horses knock it down as they pass on each side, a furrow so true that no eye can detect noy divergence from absolute straight-ness. If one saw for the first time a field of short green clover converted in a few boars into a surface of clean brown soil in regular ribs, it would be regarded as a triumph of art, I mention this, the rather because in speculative writing, the plough is sometimes depreciated, and the spade is extolled, though this very operation of preparing our wheat land could scarcely be excented at all by spade, since it is necessary that the existing sward should be perfectly harried. The eaution seems nure necessary, because, as we have seen in the Exhibition Building, ingenious attempts are being made at steam digging, as well as steam ploughing. be result of the trial of ploughs will be found in the

following report of Mr. Shelley.

RESELT of TRIAL of PLOTORS AT PUREY, By WILLIAM MILES, Eq., M.P., and John V. Shelley, Esq., assisted by Mr. T. P. Outawares.

The English and Scotch ploughs, eighteen in number, were put to work in the first instance at a depth net exceeding five inches the laod a young clover-ley, in excel-lent condition for the trial of light-land ploughs. The ploughs consisted of nine 2-wheel, three 1-wheel, and six

* Since the above remarks were written, I have received the subjoined report from Baron Mertens; but from my own former experience in dynamomatrical trials, I am bound to say that I should not draw from a single summer trinl may inference even us to the lightness of a plough in trmi may latercease even as to the lightness of a plough in ordinary work, still less as to its espacity for general work. When land is hard and dry, cleavage is the principal element of resistance; the friction is limited, and the color-sion, of course, null. Hence our English ploughs which seemed the lightest were brought in a former trial to a dead stand on moist clay. The American ploughs are very elegant and light, but seem hardly steady enough for

The work of the 2-wheel plonghs was swing-ploughs. The work of the a-water proughs was generally good; for the first test, not exceeding five inches, we found the following meet deserving of commendation in the order in which they are placed :-

No. 1. Ball's. No. 2. Howard's, marked XX. No. 3. Howard's, marked XXX.

The same ploughs were then put to work at a depth not

less than seven inches, when we found the following did the work best in the order in which they are pinced:... No. 1. Bushy's. No. 2. Howard's, marked XX. No. 3. Howard's, marked XXX

No. 3. HOWERS, MARKEY, A.A.,

JOHN VILLIERS SHELLI

It should be remarked that plought united for common unit for deep plouging distinctly have for some time been separately encouraged by the Boyal Agricultural Society. There can be no doubt that on most soils it is useful occur in four years, when the root crop means, to give the hand should, in each field, get come at least, if selly once field and thould, in each field, get come at least, if selly once field not satisfied for this purpose, since the soil cambles back into the farmer. One such deep plough, therefore, as feltware in water with four or even as herees.

2. Harrow.

The harrow has been made, I suppose, with square burs, and threefers straight-set testle, for an many centuries at it has been used; but it is difficult to make the test of such a larrow work always in different tracks, although the harrows are drugged from the corner. This imperfection has been remedied within the hast few years, may have the support of the contraction of the contraction of the contraction of the contraction of the new relation of the contraction of the contra

A third novelly has also been produced and rewarded-Mr. Coleman's expansing laurawe. The harst a every Mr. Coleman's expansing laurawe. The harst a every loose pis, on which they work freely. Thus the wish to be the coleman of the bank to bright of the harveer on he becomes of emblanch, and the totax, according to the enter of the bank to bright the coleman of the coleman of the bank to be the mainst soldiers on the child's top. It is true Mr. Coleman's harveer looks rether combiness; but not are mainst soldiers on the child's top. It is true Mr. Coleman's harveer looks rether combiness; but not a behavior from the coleman of the coleman of the coleman whose, which are easily let down, and were to more the harveer from one field to another. This is a further than the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the theory of the coleman of the coleman of the coleman of the coleman of the theory of the coleman of the co

3. Rollers.

Not many years since the landlord was often asked by his tenant for some old tree to convert into a roller. The tree roller, when manufactured, had its framework loaded with rough materials to give it weight. But it soon were and cracked, so as to produce in a year a most nogainly instrument. Sometimes the tree was manufactured into what was called a check-roll, that is to say, a roll without framework, but with an iron peg driven into each end, to which pegs the horse's traces were fastened. We have now very excellent rollers with iron cylinders, which last for ever; but it does seem that for rendering the soil fine thir regular form has this disadvantage, that they pass so equally over small clods as merely to press, not to grind them. A more squeezing notion seems to be wanted. Mr. Claes, of Belgium, exhibited a roller intended for narrow round ridges, but which seems to possess the germ of this very squeezing motion which we require. The roller consists, in its breadth, of four separate rollers of equal size; these do not work on a fixed axle, but contain a central circle of iron, within which the common axle lies for the four rollers to play freely upon.

The common axis rests, in fact, always on the lower surface of the internal circle of the four rolls, which thus more irregularly with the freedom desired. The ruller has lowerer, here uncorneded in its face.

The roller has, however, been superseded in its function of clod-crusher by the instrument which bears that name, though we still see farmers engaged in the hope-

less attempt at breaking, by the alternate use of roller and harrow, clods which refuse to be broken. The burky crop of course suffers thereby in quality as well as in measure.

4. Clod-crushers. Norwegian Harrow.

Mr. Chossella's clod-crusher is well known as one of the most popular of our new inventions. Its principal use is in breaking down turnip-land which has been fed off by sheep in wet weather and afterwards baked by the sun. Notwithstanding its jagged iron teeth, it has been found, too, the best presser for young wheat in March, when the soil has been swollen and the roots thrown out by alternating frosts and thaws. Thus applied it also arrests the wireworm, and, if it wound the tender blade, sureros use wereworm, and, it it womm the feuder blode, the wheat differs the better. By using it necording to its intention, especially in the preparation of barley-hand, we may avoid sowing on cloddy ground, or save three weeks, delay of the sowing, and in either case may gain that the source of the source at least one quarter of bariey per acre; thus paying for our implement in the first season. Mr. Gibson's cloderusher, now first brought out, is oun different construction, being formed of two rows of very narrow wheels, alternating with each other. Mr. Crosskill's has the assermaning with each other, par, crosskill's has the defect of clogging when the soil is moist. Mr. Gibson's of pressing the ground rather tightly: it is between these two weak points that a choice must be mado in selecting a clod-crusher. There is a third implement-the Norwegian, or, as it should be called, the Swedish barrowwhich neither clods nor kneeds, but then it will not press, and is heavier for the horses. I should not besitate to choose the clod-crusher if I could afford only one such implement; but from experience of both in barky sowing, should be extremely sorry to be without the Swedish tool also, which has been lately much improved by lengthening its teeth, while its draught has been lightened by one horse in four.

5. Scarifiers, Grabbers, or Culticators.

Numerous as are the forms of this implement, and it agreems in see from every you', in this reverselences agreem is not form every you', the first even seed in the even seed not agree the even and not upon system, whereas, this was to death that, important the even seed on the even seed on the even seed on the even seed on the even seed of the

of plonghing on a common stock firm, seconding to the unail fluor-course given, must be shortly stred. After the wheat ene, the inid, being fall of running with other operation, thrier more in the spring, until it appears to be clean, when the turning are sown. In the next spring it is sloughed by many good firmers brice may be supposed to the spring, until it appears to be clean, when the turning are sown. In the next spring it is sloughed by many good firmers brice making with the solid, and so the growth of the Sariey le readeder regular. The bild ene, clear, sown with the badley, given a pear's rest to the tunns until it is bedoer crop, is sown. The exceent will stand this:—

| Ploughings | Root crup | - - | 4 | Barlay | - | 2 | Clever | - | 0 | Wheat | - | 1 |

Now, it has been found that if immediately after harvest the wheat land be not ploughed, but pared at n depth of 2 inches only, the couch, the cause of so much labour, is intercepted before it has penetrated the ground, and nll that future toil becomes needless. This work is done with the scarifier. The saving of inbour is easily cal-culated, if we only compare the breadth of the scarifier, whichever it be, for there are many of them, with the breadth of the ploogh. Thus our ploughs make a farrow nearly nine inches wide, and are drawn by two horses, Coleman's scarifier, one of the best for hard ground, is 5 feet wide (seven times as wide), and is drawn by six horses. These three pair, therefore, will cover is much ground as seven pair at plough, and the labour, accordingly, would not be half of one ploughing. labour, accordingly, would not be fast of one prougning. There must afterwards be one good ploughing given to lay up the land for the mellowing effect of the winter's frost. In the spring the land can be once more stirred with a wider scarifier (Biddle's, 6] feet wide), which would go deeper, the land being looser, with four horses only. As this implement is equal in width to 84 ploughs, four horses would thus be doing the work of sixteen. The operation will in labour be only a quarter-ploughing.
There are saved, besides, in spring, infaite harrowings and rollings, which will defray the expense of drilling

Again with regard to the barley-sowing after turnips, it used to be good farming, as I have said, to plough twice. But in order to save ammonia, it is still better to pare the land as quickly as the sheepfold is shifted, This may be done by Kilby's or Bentall's paring-plough, and may be set down as a half-ploughing. The frost mellows the surface, and four horses scarifying at seedtime will make it fit for the drill. This last operation may be set down as one-third of a ploughing. We may now examine what saving of labour has been produced by this new class of implements:—

Thus it appears that cultivators will spare just onehalf of the horse labour employed on the plough, doing the work, too, as well or better. Adopting the standard of economy as the test of their merit, we find that, if a plonghing be valued at 8s, they can save 7s, an acre yearly over the whole of an arable farm. And we may yearry over the whole of an arable farm. And we may adopt this calculation in their favour more confidently, because by other means an equal saving of horse-work can be made at other seasons in other descriptions of work. Some exceptions to this general use of eultivators will occur of course to every farmer; but the substitution of them for the plough has long been known to many good farmers, though probably it has not as yet been carried out upon system by any one of them to its fullest

These implements were not originally intended for stirring hard ground, but were gradually developed ont of the harrow, which was mounted on wheels, view to the raising of loose couch out of ploughed ground, a use which nutumnal cleaning will soon, it

may be hoped, make obsolete

may be hoped, mase ousorers.

Of the prize cultivators, Biddle's, by Messrs, Ransonz, is one of the oldest, and still one of the best. The width gives it great steadioess, and its leverage is good, though wearing an awkward appearance. Many attempts have been made to remove this defect, but none so successful as the simple straight levers by which the other prize scarifier, Coleman's, is lifted out of the ground. Sioce the trial I have used Coleman's implement, and find it superior to other wide scarifiers. For these implements have hitherto had two defects. partially ont of the ground, and sometimes swerve in their course; thus in each case missing a part of their | Part axvii., p. 126,

Hence prises often the necessity of dragging them a second time crossways over the same piece of ground. Coleman's scarifier never rises or swerves, hat does its work as true as a plough, doing it therefore once for all. This is a decided advance, and greatly facili-tates the substitution of the scarifier for the plough. For the mere paring of a very tight surface, however, even Coleman's may be sometimes too broad, and Beneven Coleman's may be sometimes to that purpose. Its long tall's narrow one is excellent for that purpose. Its long snout, like a swordfish's horn, is an ingeolous which it is enabled to adhere to the land. This cheap implement has also received a prize as a subsoil plough; and though it be a good rule that no implement should do more than one thing, an exception must be clearly unade here

Another cheap paring plough, Kilby's, should be mec-tioned though not in the Exhibition, because it has the peculiar merit of turning over as well as paring the land. In limiting, as has been done above, the number of ploughings, the new system of winter eropping has been passing over, because those extra crops, green ryc or tares, winter peas or beans, would more than pay for their extra ploughing. Taking the old system simply, and working it with new tools, we see that common stock land ured be ploughed twice only instead of eight times in four years-coce after elover, when the greeo leaves must loar year-occe after elover, when the green leaves must be turned down and the dung perhaps be covered in, which the plough only can do, and once, in order to stir the had deeply for root ereps, and lay it rough for the wister frosts. I will venture to add what may appear theoretical—that, if ever stemn be successfully employed in cultivation, it will probably be less by ploughing or digging than with an implement like one of these cultivators, because they are able to work so much wider a space as they pass loog in their course. This plan of space as they pass loog in their course. This plan of antunn-cleaning is the more valuable because it is a practice of actual farmers. When we hear of wheat being grown on alteroate perions of the same field every year, such an experiment in highly interesting in a scien-tific view, yet we feel certain that it cannot become general; int when we know that good farmers are yearly extending the practice of antunn-cleaning apon stock land, we are assured that whatever be its advantages they will be generally available upon land of that character From the preparation of land we may now proceed to

II. INPLEMENTS USED IN THE CULTIVATION OF CHOPS.

1. Drills.

The sower with his seed-lip has almost vanished from southern England, driven out by a complicated macline, the drill, depositing the seed in rows, and drawn by several horses. Here, at least, one would suppose that there must be an increase of expense in the new operation, and, above all, an increase of borse labour; hat even here there is, or may be, sometimes at least, on the contrary, a diminution. For though we observe only the one seedsman striding over the fallow, he is followed by much locy—the drags and the harrows—which, though simple enough, yet, as they repeatedly traverse the land run up to a formidable amount the horse-work expended

in this primitive method of sowing.

In Mr. Haxton's Prize Essay upon Oats, which is just published,* we find the following passage:—

published,* we find the following passage:—
Saving and Harrowing.—The general practice in Scotland
is to sow easts broadcast on the winter furrow, and to cover
to the seed by two, three, or four harrows coupled together
and drawn by as many horses. . . . Six barrows, three
and three together, and drawn by the broadcast of the the
tun men, follow the sower, and give a double stroke in the direction of the ridges.

Three more strokes, five altogether, suffice, as Mr. Haxton informs us, on frinble hand, but on an old sward, the amount of horse-work expended is really wonderful. Old tough lea or wet-ploughed land requires a fir greater amount of harrowing than this to bring it into a proper tilth. Two double strokes are given in the direction of the

* Journal of Royal Agricultural Sorlety of England,

ridges to break the farrows and prevent the turf from being torn up by the cross harrowing; and it is seldem that the operation can be properly accomplished with less than six double strukes or twelve harrowings.

Thus a harrow has to be drawn twelve times over the same ground by a horse. If we imagine it to be drawn once by twelve horses, we shall see at once the vast saving which would be effected by the Wohorn drill, of about which would be effected by the Wohlord druit, of account the same which with the harrow, drawn by two horsest-only, yet burying at noze more of the seed, and followed, as it has been preceded, by a light harrow—a saving of eight horses in twelve, or two horses in three. This is, however, an extreme case; but we should not be far wrong in saying that by the Wohnra drill, which will come presently under our notice, two horses in four, or one-half, might be saved to the farmer who has been in

the practice of broadcasting. There is also a saving in seed by the use of the drill; but it is further interesting to observe how the drill dove-tails, as it were, with our last class of implements, the searifier. When drilling was unknown, great stress was laid upon so ploughing the land that the furrow edge would stand up sharp at the exact angle of 45 degrees, in order that the harrows eatching those edges and crombling them down might properly cover the seed. No one would have dreamed of sowing corn upon scarified land. Now, on the contrary, the surface may be perfectly smooth; on the contrary, the surface may be perfectly smooth; and wheat may be drilled after turnips in winter upon land which has been only breast-ploughed, pared, that is, half an inch deep, for the seed, if drilled, is perfectly covered, and wheat prefers u firm bed. The drill again is indispensable for the use of many new artificial unanures, distributing them by special coulters beneath the nures, distributing when with earth, that their excesses ground, and overing them with earth, that their excesses strength may not injure the seed, which is deposited, above, that of all. The benotiful system of borse-hoeing depends too, of course, entirely on the use of the drill, which may be a the key of the new system. We ought, be regarded as the key of the new system. We ought, then, to regard the whole as a system; not, using the drill, retain ancient conrises of ploughing which were meant for the seedsman, nor, on the other hand, fall short in the consequences of the drill-use it, that is, as some farmers do, but with no artificial manure, and without a horse-hor to follow.

As to particular drills, there is the general-pur drill, a very complete implement, capable of drilling, with or without manore, wheat, beans, and turnips at the different intervals suited to those plants respectively, from 2 feet to 7 inches. It comprehends, in fact, two drills, the parts of which are substituted for each other at pleasure; yet admirable as is the implement, one may question whether, as corn seldom requires manure to be sown at the same time, it be not better to buy two drills separate, one for eorn, the other for turnips. One improvement should be used with all drills as most conducive to the ease of the carter. Formerly, drills went upon one pair of wheels, but after they were made to carry a large weight of manure, it became hard work for the earter, who, in his zeal to keep the work straight, while leading the thill horse with a stick, stended the shaft with th other hand, which was almost benomied when he reached the end of the furrow. A fore-carriage was therefore added by Messrs. Garrett, which is noder the command of the earter, who, by a lever keeps, without exertion, one wheel in the rut down which it previnosly passed, so that the rows must be perfectly parallel. This steerage is the carter's friend, and the horse's friend too, as it removes a heavy lond from his back. Messrs, Hornsby have since adopted, and perhaps improved on the principle.

. Journal of Royal Agricultural Society of England, xxvii., p. 126.

Report on Deills.—Nearly twenty of these implements

were selected and sout down to Pusey for trial. Mesers. Hurnsby and Son had five drills: their ten-rowed corn and general-puryone drill was a highly-finished and well-made masshine, which are not improvement, patential by them, of India-rubber tubes for conducting the seed down to the clannel massle by the coulter, which I consider a whalshe improvement upon the old pian of a series of cups, made of the, working one within the other. This drill also has

The excellence of all Messrs, Hornshy's and Garrett's drills is well known. The Wohurn drill of Messrs.

another improvement, of two coulter bars, by which an equal pressure is obtained upon every coulter, and the double-action lever enables the manure to be deposited to any depth, and covered up previous to the seed being depo-sited. The price of this drill is 44.

A ten-rowed corn and seed drill, peculiarly adapted to drill corn on side hills by a highly-finished and logenious contrivance, of extending or contracting, hy means of a screw, two legs, similar to the governor of a steam-engine, attached to the side of the drill, and by which (the drill being hung by or superied on the centre) it can be rega-lated while in motion. It has also improved sides for re-gulating the quantity of seed delivered; it has the improved being rules takes are sdia-rubber tobes and coulter bars, like the former drill : also a very excellent fore steerage, with a rack and pluion attached, by which it can be goided with great exactness. It did its work extremely well; and we awarded it a Council

Medal. A three-rowed drop drill, which can be used either on ridges or flat ground. If the capable of depositions pair tolkeds, in given quantities from 10 to 50 bathelis per acre. The seed can be dropated with the manure, or the manure covered up with old said absect dilivered on the manure covered up with soil and the seed dilivered on the west of the seed of the seed of the seed of the seed of well. Piete 34. We assessed it a Consull Medal. A New-rowed turnip drill on the flat, for drilling turnips of manufack-west well on manure. This drill carriage of manufack-west well on the manure. This drill

embraces a variety of improvements—the reliefs being made in sections capable of being adapted to a larger or smaller ridge of the proper form to receive the seeds, and the second concave rollers follow, and leave the ridge in a perfect form. The drill is now so perfect, and did its work so well, that we awarded it a Council Medal.

Messrs, Garrett and Son exhibited their well-known meral-purpose drill, with the improvement of a simple method of regulating it so as to work on the sides of hills. There is also a slide for the regulation of the feed of the

There is also a slide for the regulation of the feed of the manure, with an index to show tha quantity delivered. Price v2. This drill did lis work remarkably well; and we considered it cuttiled to a Council Medial. A four-rowed turnip drill on the flat, embracing the im-provements of the general purpose drill, was also put to a severe test with other drills; but, upon the whole, we con-sidered it to do its work a shade better than those brought against it, and we awarded to it a Council Medal.

A land-barrow drill—the construction and excellent workmanship exhibited in the implement morited the un-

qualified approbation of the jury-distributing gress-seeds broadenst in an excellent manner, by means of two com-partments in the same box, that the quantities of each may be regulated as desired, the clover and ryo grass being mixed in their transit to the grooms. We considered it a very useful implement, and recommended it as worthy of a ucil Medal.

Coöncil Medal.
Mestra Bansomes and May, of Ipswich, exhibited a very
well-constructed drop drill, which did its work excellently,
well-constructed drop drill, which did its work excellently,
drop drills; and, for the ingenuity of contrivators and
superfortly of workmanship, we awarded it a Frize Medal.
Mr. Bashy, of Nex Ion-le-Wildow, care Bedale, exhibited
a drill which be called a ribhing drill, which is well constructed, vary shipple, and strong, and does its weck exstructed, vary shipple, and strong, and does its weck extremely well, making a broader seam to lay the corn or seed in, which is considered by many, and especially by foreigners, as a great advantage. Price 14t. To which we awarded a Council Medal Messrs, Hensman and Son, Woburn, Bedfordshire, exhi-

bited a self-adjusting steerage corn drill. This drill varies from the generality of drills, as it is drawn from the centre by whippic-trees instead of shafts; and the drill-man behind can steer or direct the drill with the greatest nicety, can steer or carect the drill with the greatest helety. The corn-bus of the drill is ontherly self-acting, and delivers the seed equally well going eliber up or down bill. It is also capable of horse-hoeing, by attaching hoes to the levers, instead of the coulter elsares. This implement works very well, and the price from 184, to 204. We awarded it a Prize

Cines, of Belgium, exhibited a nine-rowed, very M. Ches, or neutron a mine-rower, very simple, well-made Belgian drill. It did its work extremely well. The conters mado a broader seam to receive the corn than the generality of English drills; and the harrow which is attached to the drill covers the seed with fine HUMBRES and Soy has also obtained a Prize Medal and has this peculiarity .- Is all other drills the coulters, which distribute the manure or seed, hang from the carriage. In this shall the earriage rests upon the coulters, which are like the trons of skates; it may be said, indeed, to run on four rairs of skates. Hence this drill's nower of penetrating hard ground, and of giving a firm bed to the wheat-seed in soft ground. Each drill conlice, however, preserves its independence as when suspended This self-adjustment is required by the inequality of tilled ground, and is thus obtained : each pair of coulters is fixed to the end of a balance beam, these again to

others, and they to a central one. Thus each coulter, in well-poised mak, gives its independent share of support. Hence this drill is simpler in management than any other, for, resting on its own base like a plough, it is also other, lot, resting on its own once time a prosum, it is now guided from behind like a plough; and any man who can hold the stilts of a plough for a straight furrow can steer this drill with a pair of horses only and reins. Hence, too, its convenience; for if you wish to now close up to the sheepfold, instead of ordering out a drill and four, as it were in state, you merely keep back one plough from

the field.

Hitherto we have been dealing with corn drills intended generally for seed only. In end-avouring to fill up the picture of the point of development at which agricultural mechanism now atands, we come next to turnip drills, in which manure is also distributed as well as seed, generally which manure is also distributed as well as seed, generally books or superphosphate. As in well known, there are two ways of gowing turnips, the ridge and the flat. In the ridge, or Northambershall netched, the ground is thrown into ridges by a two-sided plough, "a double Tom," and, damp being laid in the intervals, the ridges

are split, and the new ridges enfold the dung. It is on these ridges that Mr. Hoassn's prize drill works, depositing manner-dust and seed, and reducing the ridge, by concave rollers, to a compact rounded form.

The ridge system, however, is most at home under our cool northern and maist western skies-in Northumberland and in Laneashire. In our drier districts, as in Lincolnshire and Berkshire, it is found better with the bulk of the erop, when rain does come, to make more expedition. Using a turnip drill, therefore, 6 feet wide we sow four rows at once with some light manure, and nre thus enabled to sweep rapidly over our ground, while the seed finds a moist hed fit for germination before the

dust begins once more to fly.

Still, however rapid the four-row turnip-drill, southcountry farmers are often obliged to wait in July for a soaking shower-waiting, indeed, often in vain, until it is too late to look for a bulky turnip erop. A south-country farmer, Mr. Chandlen, of Market Lavington, Wilts, has produced a machine to deal even with this defect of our elimate. His water-drill pours down each annure coalter the requisite amount of fluid, mixed with powdered nathe requisite amount of fluid, mixed with powdered nin-nure, and thus brings in the plant from a mere bed of dust. Having used it largely during three years, I may testify to its excellence. Only list July, when my build had cented turnip-sowing on account of the drought, by directing the use of the water-drill, I obtained from this later sowing an earlier and a better show of young plants than from the former one with the dast-drill. Nor is

earth as soon as it is dropped. There is no part of this drill likely to be out of order: It can be worked with cost horse; and there appears oo part of it that, in case of accident, could not be repaired by a common blacksmith.

Price 10t. In consequence of its combined merits, sim-Price 19. In consequence of the consequence merra, simplicity and cheaparen, we awarded it a Prize Medal. Liquid-manure Distributor.—Mr T. R. Revers and Mr. J. Bratton, of Westhury, exhibited in liquid-manure distributor, which did its work in an extraordinary manner. distributing equally manure-watere or the thickest sewerage lu the most perfect manorer. From the construction of the machine, it is impossible to else in the delivery of the thickest slush. It consists of a series of backets or troughs that are attached to a metal chain or band, and which works round two rollers as the eart goes on, the wheel giving the metiva power to the rollers. The price of this admirable nater-eart, complete, in 164. We awarded it a Prize Medat. C. B. CHALLONER

there any increase of expense, if water be within a mode-They must be mixed with ashes that they may be diffused in the soil. Now, the expense and labour of supplying these ashes are equal to the cost of fetching mere water and, apart from any want of rain, it is found that this suction of moist diffusion, dissolving, instead of mingling

only, the superplosphate, quickens its action even npon damp ground, and makes a little of it go further. There is yet one more kind of drill. The common drills economize manure by concentrating it in lines along the rows of the turnip plants. Thus, instead of slovelling lones from carts, as was first done in Lincolnshire, at sixty husbels per acre, we came to sow only sixteen bushels of bones in lines, or more recently but three hushels perhaps of superphosphate, prepared either from bones or from the animal remains of geological ages, mmong which Liebeg told us, and told us truly, to search for our phosphorus. But though turnips are sown in lines, and come up thickly in lines, no sourer are the thriving young plants well marshalled in green array than nineteen in twenty are ruthlessly cut down by the hoe, so that the field appears for a time once more bare. The roots must, of course, be allowed ample room in the row, but some manner will have been wasted in nonrishing the plants doesned to perish. Hence, Mr. Hornsby's dropdrill, avoiding this wholesale massacre, is made to drop the seed and the manure, by a second step of mechanic fragality, rally at these points in the lines where the ines fixed points, for their distance can be varied from 9 inches to 18 inches asunder, and the intervals between the rows can be equally varied from 15 to 30 inches. The dose, again, of mixed monare can be varied from ten to fifty bushels per acre. Such is the elastic, yet accurate plinhility, with which in agriculture mechanism has seconded chemistry. Having now gone through the various kinds of drills—corn or turnip drills, ridge or flat drills, dry or wet, line or drop drills—we may pass to a kindred but entirely new class of implement.

2. The Top-dresser, or Manure Distributor.

Although, as has been said, wheat is seldom sown with the manure-drill, being usually provided with its chief requisits, nitrogen, through farm-yard dang or through sheepfolding, no plant is so liable as wheat to break down from its first promise; and on inferior soils, whether too light or too heavy, one might almost say that wheat always looks well before Christman, and always looks ill before Lady-day. Our predecessors, to refresh its flagging strength, used to spread soot or pigeon's dung, both containing ammonia, over it, especially on the lower sides of the ridges near the water-forrow, where the plant was perhaps almost killed by the lodgment of rain. But their practice was, of course, limited by resources so narrow. We, having guano and nitrate, can deal out liberally the timely supply. But if sown by hand, there very light manures, especially guano, are carried away before their descent by a strong wind; and sometimes when half a gale has been blowing, it has seemed to me that I was samuring my neighbour's field quite as much as my own, A usnure-distributor was therefore required; and the agricultural meeting at Excter brought out eight com-petitors, the winner being Mr. Holmas's, of Norwich,

I rejoice to find that we have not only a good invention one. but that it is being actively used. The machine. bere, but that it is being actively used. new as it is, and involving a new outlay for artificial manure, is employed very largely in the western division of Norfolk-the classic ground of improvement-for distributing a small quantity, such as three bushels per acre, of game or nitrate of soda, or a larger quantity of superphosphate and rape-cake, on wheat in the spring of the year. This fact deserves the more to be known, because the convincing argument for any agricultural change is that it has become a practice somewhere or other argument that answers where reasoning fails. The other aryoment-that, namely, founded on quick return-is also not wenting, as it has lately been shown that nitrate so applied on poor land will sometimes yield double its own value, -nearly a quarter of wheat at a cost of 20x, per acre,

It is curious, indeed, that this very cheap and simple machine is on some soils superseding the more costly and intricate drill. In the words of Mr. Holmes, its inventor .-

They were used very much last turnip-sowing season, and considerably more this season, for sowing manure (rape-cape, malt-coombs, and guano, about 8 or 10 bushels (rype-cspe, malt-coombs, and grame, about 8 or 10 bushels per sere, and in some instances as much as 20 bushels to the acre, when a quantity of burnt earth or ashes are mixed) into the furnows of the ridged termip-land, at 24, 25, and 27 inches apart. The ridges are then turned over on to the manner by the double-to-easted plough, and the manure is envered sufficiently out of the way of the seed, although distributed equally around, so that, Instead of striking immediately into the whole body of manure—as is the case when drilled in with the manure—it eatches it gradually in its different stages of growth.

This plan proved highly satisfactory to all those who ied it last season, which has induced many others to pursue the same course this season, not only as regards the erops themselves, but also in the labour required to put the erop in. Our manura distributor will cover 3 or 4 turrows erop in. Our manurs distributor will cover 3 or 4 turrows at 127 inches apart, if required, and is worked with one horse. It is followed by a light drill aspressly for turnips and manged-wurzel, which is also worked by one horse. Thus it will be resulty seen that a great so ting of horse-turnips and the second of the secon place of the drill.

This saving of horse-work is indeed great: but it must not be disgussed that there is inconsistency between the principle of general diffusion here recommended, and the concentration which is the aim of the drop-drill. Each method, in fact, has its merits for different purposes,concentration for pushing the young plant, extension for feeding it in its later stages. The question, like many others, must be decided by longer experience; but the most perfect method would probably be the combination of both plans. To return to our present subject, the young growing wheat, it may not only be revived in spring by additional food, but is usually, on light land, settled down in its bed by

3. Press-rolls.

On some soils, especially the calcareous, the ground alternately frozen and thawed in winter throws the roots of the whest plant almost out on the surface. For this mischief and that of the wireworm, flocks of sheep were ouce driven over the wheat; but we have long had the well-known wheel-roll, and, as has been said, Crosskill's clod-crusher is a still better presser when it can be used, but is not a perfect substitute, as it requires the land to be The new clod-crusher, however (Gibson's), must serve, I suppose, for both purposes equally well.

4. Horse-hocs,

Machinery can do but one thing more for the growing erop. The hoe not only clears away a bost of young weeds, but, by loosening the erasted surface, admi air, and stimulates the growth of the true crop. Even vineyards are thus found to be relieved during long drought, and hence it is said that iron should be always between the rows of our root-crops. Ridged root-crops have been long hood by a single horse, one row at a time, farrett's horse-hoe cleans four rows at ence of turnips, six of beans, nine of wheat. To hoe wheat thus is a de-licate operation: to hoe even turnips so, when their lines . are hot just distinguishable, or again, when the leaves almost meet, requires not only a first-rate implement, but a steady hand and cool head to steer it. This tool will stand well the test of economy, for it will go over ten neres a-day canily, with two horses (sometimes coe), a man, and a hoy, at a cost of, say 10s. The work could certainly not he done otherwise for less than 2s, an scre, 20s. altogether, even if you could find hands to do it, in harvest-time. This estimate accords, I find, with the report of the Judges at the York Meeting, practical farmers, who thus speak of the implement:—"The work done by it is far superior to any hand-horing; it can also be done for less than half the cost: indeed, so highly do we value it, that we think no farmer can farm as he ought without it." The cross, after horing men corn the The crops, after hoeing, soon cover the

ground, and are thus beyond man's interference until time, the ripener, summon him to the operations of

III. HARVESTING INPLEMENTS. 1. Reaping-Machine.

At the opening of this century it was thought that a successful reaping-muchine had been invented; and a successful reaping-muchine had been invented; and a reward was coted by Parliament to its author. The muchine was employed here and abroad, but, from its intricacy, fell into disuse. Another has been lately deferred to the control of the control wised in one of our colonies, which cuts off the heads of the coru, but leaves the straw standing, a fatal defect in an old-settled country, where the growth of corn is forced by the application of dung. Our farmers may well, therefore, have been astonished by an American implement which not only reaped their wheat, but performed the work with the neutness and certainty of an old and perfect machine. Its novelty of action reminded one of eeing the first engine ron on the Liverpool and Manchester Enilway in 1830. Its perfection depended on its being new only in England, but in America the result of repeated disappointments and untired perseverance. The United States' Patent Commissioner says of Mr. M'Cormick's Resper-

In agriculture it is, in my view, as important, so a lubcorsaving device, as the spinning-jetny and power-loom in manufactures. It is one of those great and valuable inven-tions which examence a new era in the progress of im-provement, and whose beneficial influence is felt in all coming time.

Besides difficulties common to all inventions, the machine could be tested but for two or three weeks in each

was applied to the instrument the barvest was over, and the new form had to wait a whole year for its trial, when some fresh failure required a fresh year's postponement of final success. It seems right to put on record Mr.
M'Conneck's own account of his progress, or some extracts at least from a statement written by him at my request :-

My father was a farmer in the county of Rockbridge, State of Virginia, United States. He made an experiment in cutting grain, in the year 1816, by a number of cylinders standing perpendicularly. Another experiment of the same knall was made by my father in the hervest of 1834, which satisfied my father to abandon it. Thereupon my attention was a father to abandon it. Thereupon my attention and and put in operation, in cutting late case on the form of John Steele, adjaining my father v, those parts of my present respectable the platform for receiving the core a straight blade taking effect on the corn, supported by stationary fingers over the edge, and a reel to gather the corn, which last, however, I found had been used before, though not in

the same combination. the same combination.

Although these parts constituted the foundation of the present machine, I found in practice innumerable difficulties, being kindled also to a few weeks In each year, during the harvest, for experimenting, so that my first patent for the resper was granted June 2 tith, 1834. During this interval I am offers ordinarily no decades it, and I am offers ordinarily no obscales it. and pursue my regular business, as librly to be more profetche he having given me a farm. No machines were sold until 1840, and I may say that they were not of much practical value until the improvements of my second patent, 1845. These improvements consist in reversing the angle of the These improvements consist in reversing the sngle of the sischie-teeth alternately—the improved form of the fingers to hold up the corn, &c.,—an iron case to preserve the sickle from elogriging—and in hetter mode of separating tho standing corn to be cut. Up to this period nothing but loss of time and money resulted from my effort. The rais has since steadily increased, and is now more than a thousand

One merit of the machine consists in the extreme simplicity of its cutting part-a straight saw, vibrating rapidly right and left. The teeth however, incline niternately in each direction, so that at each vibration half at them are inclined in the direction of the motion, as is

As to the practical working of the Braper, two horses drew it at the trial very easily round the outside of the

crep until they finished in the centre, showing that they could cut easily fifteen acres in ten bonrs, drives sitting, and mother stands on the machine to rake. It is hard work for him, and the men ought sometimes to change places. The straw left behind at the trial was cut very regularly—lower than by reaping, hat higher than by fagging. The inventor stated that he had a machine which would cut it two inches lower. This is the point, I should say, to attend to, especially for autumn cleaning. Though it seems superfluous to bring this ma-chine to the test of economy, we may estimate the pre-sent cost of enting fifteen acres of wheat, at an average uf 9s, an acre, to be 6d, 15s. Deduct, for horses and men 10s, 3d., and for hinding 2s, 6d, per acre; the account will stand thus :--

The saving of wages, however, would of course be an imperfect test of the Reaper's merits, since in bud seasous and late districts it may oftcu enable the farmer to save the crop.

Since this statement was written, fresh trials have been made of Mr. M'Cormick's reaper, as also of one by Mr.
Ilussey; and as the award under the Commission has been called in question, it is right that some statement should be made on the subject. In the first trial at Tip-tree Hall, Mr. M'Cormick's resper worked well, and the other did not act at all. As the corn, however, was then green, it was thought right to make further trial, and special lenve was obtained from the Council of Chairmen to give two Council Medals, one to each Reaver, if, on further trial, their respective performances should be found to deserve one. The object in our second trial was not to decide which was the best implement, but whether either or both were sufficiently good to receive the Council cither or both were sufficiently good to receive the Conneil.

Medal. Mr. McOrmick's in this trial worked—as it has since worked at Circucester College and elsewhere—to the admiration of practical farmers, and therefore received a Council Medal. Mr. Husser's sometimes hecame clogged, as in the former trial at Typree, and therefore could not possibly obtain that distinction.

Purther trials, however, have since been made by other

parties, elsewhere, in which Mr. Hussey's machine worked well; and one of our colleagues. Mr. Thompson, informs me that it has been used for a week by a practical farmer on his own form, who was perfectly satisfied. Its in-ventor states that at the trials for the Commission the failure arose from the mal-adjustment; and Mr. Thompson informs me that st one of the subsequent trinls a similar mal-adjustment impeded its action, until Mr. Hussey arrived to set it right. I am bound, then, to express my own individual opinion that the merits of the machine are such as critito it to a Council Medal, and my regret

that it should be formally disqualified to receive one We have, then, two good American renping-machin Their respective merits time will discover: but there is one caution which applies to the introduction of both into Eugland. They both cut by a sidelong vibration, the frequency of which must be determined by the number of straws to be ent in passing over a given space. Naw, as the acreable yield of England nearly doubles that uf America, our straw it is probable stands much thicker than in the crops these Respers have been seenstomed to deal with, so that both implements when applied tomed to deal with, so that coun imprements when appared to heavy crops must be adapted to the superior farming they will have to encounter. At present, we only know tant Mr. M'Cormick's machine is best for harley and oats when not intended to be bound up in shenf : Mr. Hussey's when her intended to be bound up it seems all the separate for corn lid by the weather, or standing upon steep ridges. Mr. Hassey's can cut rushes, as was shown in Windsor Park. Mr. MCormick's last received a prize this autumn in the United States for cutting prairie grass, competing there with three others.

2. Horse-rakes.

These are very neat implements, about 8 feet wide, nning on low wheels, drawn by one borse rapidly be tween the rows of cocked barley, cats, or hay, and upped from time to time, while they move on, hy a man who follows. One of them must do the work of 10 or 15 woman. They are common in many counties, yet in others unknown, or, when made known, not adopted.

3. Hoymakers,

Every one has seen these machines tossing the hay high above them: instead of this rapid action, if the movement of the frame be rovereed, they gould yiel the grass without lifting it from the ground. The saving of labour must be on great as with the horse-rake, and the work is far better done.

4. One-horse Carte.

It is proved beyond question that the Scotch and Northumbrian farmers, by using one-horse carts, save one-half of the horses which south-country farmers still string on their three-horse waggons and three-horse dungcarts, or dung-pots, as they are called. The said threehorse waggets and dang-pots would also cust nearly three times as much original outlay. Few, I suppose, if any, farmers by these expensive luxuries now; though it is wonderful they should keep them; for last year, at Grautham, in a public trial, fee horses with five carts were matched against five waggons with ten horses, and the five borses heat the ten by two loads. It appears that some of our one-horse carts, not being well made, carry the corn less stendily than the waggons; but this last defence of the primitive waggen is broken down by the curved form which Mr. Ilmby has given his barvest rails, as is well explained by Mr. Thompson, of Mont Hall, a high authority on these matters, in the following interesting

Curts and Wogons.—The Jurers appointed to examine these classes of implements were considerably influenced in their selection by the opision that really good early ought to be capable of easy adaptation to all the kinds of work for which agricultural wheel-carriages are required, thus rea-dering wagnons unnecessary. The great majority of carts dering waggons unnecessary. The great majority of carts are, however, Ill adapted for harvest work, and this is, no doubt, one reason why such slow progress has been made in substituting light carts for waggons. It may, therefore, be useful to mention the leading points which ought to be kept in view in the construction of harvest carts, or harvest

In view in the construction of harvest carfs, or harvest frames analyzed for common earth. General capits (see incommon earth. General capits) (as it is been upon one pair of whech intend of two, it is negocid to much more velocist trains of its powers of colesion. Nevery slight alternation of positions of the bowns of the capits of the of which expedients causes a waste of time, which can lil be spared during barvest; and, in spite of such precautions, seeldents frequently occur. To remedy this fault, some makers have constructed harvest frames with one bar only makers have constructed harvest transes with one has rape. as it is the front and back, attengthened by leven stays, as in the state of Bushy's earl, where the ends and sides all slope towards the body, so as to condense the load by the motion of the eart. The fact that miscel ends have a tendency to con-dense the load was first pointed out by the judges of earts at the Norwich Blow of the Royal Agricultural Society in 1849; and in Mr. Busby's eart three suggestions have not only been adopted, but improved upon, by raising the sides as well as the ends

Another important point is, that carts should be few, not only for the sake of diminishing the isboar of leading, but to lower the centre of gravity of the load, and thereby keeps the great inequality of pressure on the horse which In experienced in high outer when going up or down his trans diminates the shaper of support in congruent congruent to the configuration of the configuratio

ary importance, which may be vested to the waste of the purchaser.

2. Crosskill's whasls are deserving of notice, being made by machinary, and accurately fitted. His operations being conducted on a large scale, he is enabled to furnish them at

a monitoring price.

The properties of the price of the p

registrophics. Stiffmills to ensure value and few segments to the state of the way of the state
express purpose of deciding the point. The gran necessity at present existing for the introduction of every practicable economy will doubtless oventually substitute light carts for waggons, and in the meanwhile something would be galard by introducing light, cheap, pole-saggons in the place of the cambrous shaft-waggons which are too frequently met

"In the Cresibility wageon was considered a very good specimen of an insproved wageon, being light, too, and chessy (price 264, including both pole and shafet). The advantages of a pole over shaft as exp, that horses can draw a greater weight when yoked abresst thus at length; that in the contraction of the contract

Mr. Banby, it will be observed, by placing his shafts on the side of the cart, has lowered his cart. It has howed it as much as one in fluor, thereby diminishing the tool of filling carts with dung, stones, earth, &e., to the amount of one quarter. If we calculate how many throusand arms are employed in this way throughout Dagland for many simple as it is, will save no small aggregate amount of manapplied strongth to the country of large.

massiplined strength to one country in mage,
Having gone through the three chases of implements
with which the land is first prepared, the crops next caltitude, and the grain afterwards harvested—and having
found them to stand well the test of country by which
all machines must be tried—we have now to examine the
fourth, by which the corn is lastly made ready for
market.

PERPARATION FOR MARKET. Moreable Steam-regions.

Every visitor of the agricultural department usual have been struck with the little steam-engine, which, though the mean the steam of the steam of the steam of the recer, showed the same compactions of form and the assess disposition to work. They seemeted the ruder tools of hastendry with modelinery fitted for more instruted to the steam of the steam of the steam of the team-engine tax we been hear used in Northenderland has its allichiumer. These movemels estam-engine have been called forth by the Royal Agricultural Society to the steam of the steam of the steam of the steam been called forth by the Royal Agricultural Society to the first engineer, for the fallowing reasons—

If a firm he a large one, and especially if, as is often the case, it be of an irregular shape, there is great waste of labour for bornes and men in hringing home all the corn in the struct to one point, and in again carrying out the dung to a distance of perhaps two or three miles. It is therefore common, end should be general, to have a second outlying yard. This accommodetion cannot be reconciled with a fixed engine.

reconcise with a taxed supplex.

If the farm be of n moderate size, it will hardly—and
if small will certainly not—bear the expense of a fixed
engine: there would be weate of capital in multiplying
fixed engines to be worked but a few days in a year.
It is now common, therefore, in some commises for a man
to invest a small capital in a moveable engine, and care
his livelihood by letting it out to the furner.

But there is a furtire advantage in these movember interpolation in the property of an all known. It illustron comcapines and the improved threshing-machines we can explore and the improved threshing-machines we can will be said. How every only the said of the one as well only. The maxwer is simple. Notice can you may will be said. How every only the said of the one as well of P. The maxwer is simple. Notice can you may the work of the save threshing-machines, but it takes no the work of the save threshing-machines, but it takes no threshing in also far pleasanters and healthier for the threshing in also far pleasanters and healthier for the threshing in the free pleasanters and healthier for the threshing in the free pleasanters and healthier for the threshing in the free pleasanters and healthier for the threshing in the free pleasanters and healthier for the threshing in the free pleasanters and the same and the follows to be transit not inconsiderable: that then these machines are also as the same and the same and the follows the transit not inconsiderable in the three three processes are also as the same and the buildings. Instead of three or more barns clustering round the homestead, one or other in constant want of rapair, a single building will suffice for dressing corn and for chaff-cutting. The very barn-floors saved will be no tenganecalt item. Now that outsings are required for new purposes, we must, if we can, retrench those buildings whose objects are obsolete. Open-air threshing may appear visionary; but it is quite common with the new muchinery; nor would any our perform the tedious new meannery; no wound any one per to the the con-manageure of setting houses and men to pall down a rick, place it on carts, and boild it ma again in the barn, who had once tried the simple plan of pitching the sheaves at once into the threshing machine. These moveable steamengines have been gradually improved by the yearly trials of the Agricoltural Society. It will be seen by Mr. Carr's Report" that such yearly trials are still needed, as the worst of those exhibited consumes three times more coal than the hest. Mr. Locke, M.P., whose engineering ex-perience gives weight to his jndgment, thinks that in other respects, too, they might be still further improved:-

To P. Peser, Esq., M.P. London, 11, Adam-street, Adelphi,

DEAR SIR, July, 1801.
The detailed report of Mr. Carr, of the rasults of the experiments made on the portable steam-engines, has already been presented to the Jury over which you provide; and as you desired from me a short statement of my views of Mr. Carr's report, I beg to send you the following:—
You will find in the tabular statement of the consumption of fuel, that the several makers stand in the following order of excellence:-

					P	leg home	-posets	
Mesers.	Hurnsby and Sons					6.79		
	Tuxford and Sons					7.46	79	
	Clayton, Shuttlewo	rth	ap	4€	ъ.	8.63	11	
	Barrett, Exell, and	A	ndr	8 TK		9.20		
	Garrett and Sons					11:65	99	

* The mode of ascertaining the sumunt of duty done and * The mode of ascertaining the anomat of datay data and weight of coal comments, in a given time by each engine, was the same as that adopted by the Boyal Agricultural and the same as that adopted by the Boyal Agricultural and Machinery; and the dynamous-time runed from the time and Machinery; and the dynamous-time runed from the time and Machinery; and the consulting engineers, movely of patients and almost different consulting engineers, movely of plating their plinder and working parts in a wronghi-iron box at the end of the boiler/a baying a part of dozen to be the above up where not in work, which if certainly their a ground them, and if many particular water-certainfielding.

this, the tubes at the smoke-box end were rendered difficult There were two ougines brought to the trial to be got at. yard upon this construction, one a 6-horse direct-action upright cylinder, the other a 4-horse oscillating; but the former worked out the most duty with the least fuel.

Messrs. Hornsby and Son were distinguished by placing thoir cylinder inside the upper part of the fire-box, the whole of which, together with the rest of their boiler, was carefully felted and lagged with wood; and they had a wall-constructed water-heating apparatus in their smoke-hox, which also helped to produce the satisfactory result of

great aconomy in fuel. Messrs. Garrett and Son, in their engine, had made a great effort to combine lightness with strength, having subgreat effort to combino lightness with strength, having mix-structed venogist for east non in the bearing for erank shaft stated venogist for east non in the bearing for erank shaft bearing surface, but the fire-loos, to insure greater strength and e leas smooth of fifst surface expend to stem pressure, was made partially eval, and considerably smaller than leaves and the state of the state of the state of the level of many of the tabes of the boller, and the finner hav-ing to descend over a bridge, the manufacturer approach themselves quite savare that this construction of fire-loor themselves quite sware that this construction of fur-box would present their studing quite so well as some with respect to fact consumed, but considered that superior promote, that close of ergion seldow solving more than a form months in the year, and having to be conveyed from form to farm. And I certainly econdered this engines that the promote the superior of the superior to the superior of the superior to
In a subsequent trial, however, made to test the strength of Liangenneck coal with Mesers. Shuttleworth's engine, it appears that both engines burnt precisely the sumo amount of fuci; and Mr. Carr has deduced from this circumstance, that, but for some accidental derangement in the slide, in the main in bulated experiments the consumption of Mesors. Garrett's englise, which was 11-65 lbs. per horse-power, would not have been more than Mesors. Shuttleworth's, or 8.63 lbs. per horse power.

This mode of reasoning is, I think, liable to objection; and I allude to it with a view of preventing an undue im-portonce being attached to it. liesides, I do not entirely concur in the remarks made by Mr. Carr on the construction of these two engines.

Mesers Carrott's fire-box is, in my opinion, decidedly in-ferior to Barrett, Exall, and Co.'s; and the workmanship generally is not superior. It is lighter, and so far it is better; but whether the smallness of the fire-box, to avoid weight, may not entall other disadvantages, is a question on which a doubt may fairly arise.

As regards the engine of "Ransomes and May," which

As regards the engine of "Ransomes and May," whech, from some accidental defect, did not go through a trial, I would beg to say, that is point of workmanship it is equal, it not superior, to any of the engineer tried, I think the first the engine of the engine of the engineer the engineer other respects it is, I think, a good, serviceable equine. As regards that other engines, I spreae entirely with the remarks made by Mr. Carr. If I might be permitted to suggest as milled satives to the makers of these engines, I would hep of them to attend more to the proportions of the varieus working parts, and less to external ornament. There is a want of good proportion in several of the engines; and this, to a mechanic or an economical farmer, is of more importance than a profusion of hrace. JOSEPH LOCKE.

Much progress, however, has been made, as our best eugine new consumes less than 8 bs. of coal per hour per horse-power; whereas an engine made by the winning manufacturer of four years ogo consumed 28 lbs., that is, four times as much fuel for the same work

Liangenneck and Newcastle coals, she worked oot to a decimal the same number of peands of coal burnt per berse-power per hour as her competitor, which, allowing for the proved difference in the strength of the coal in forour of the proved difference in the strangth of the coas in notons on the Welsh, would have given Messrs. Gurrett 8:63 lbs. of that coal burnt per horse-power per hour instrad of 11:65, as shown in the tabular statement; which more favourable result I think them oulte entitled to, as the democratent in the slide was parely accidental.

Messrs Clayton and Co.'s engine was exceedingly simple, and worked well; the governors had perfect control during the trial, which was passed through with great steadiness and eredit to the makers. As regards the other engines, I will proceed to notice

As regards one order as tested:—
Messrs. Hensenan and Son's 4-hors, of moderate workmanship, was evidently the production of a novice. The
boiler was too small for the power, and the consumption of fuel more than as much again as most of the first-class

engines.

Mr. Butlin's 41-horse: workmanship moderate; arrangement of working parts simple; and duty done for coal con-sumed fair when compared with others of its class. Mr. Caboris 9-hors: workmanhlp moderate; arrangement of engine III designed; and entire weight far too great to be generally suitable for a portable engine. The beller being a large one, with enniderable heating surface, the

being a large one, with considerable besting surface, the duty done are consparatively good, and with the surface of the duty done are comparatively good, which we have a surface mainting neederste. The cylinder and creak-shaft hewing in this conjugate price of the surface of the surface of the was bothed in the boiler, an arrangement giving superior and the surface of the surface of the surface of the surface was been as the surface of the surface of the surface of the was bothed in the surface of the surface was large for the size of the engine, and the duty done for eval consumed has more nearly approaching in first-class computings; in this, as whole, I cannot peak let with iavourably of the engine.

Mr. Barrall's 6-borse: workmanship fair, and arrange-ment of working parts simple and good, and contemption of fuel comparatively moderate; so that in this case also I must raport favouably.

Mesars. Ros and Honson, Strand, London, 4-horse; workmanship very inferior; goneral arrangement ill-designed

2. Threshing-machine.

This is the most complicated agricultural machine in general use; but, though it has also been long in use, and though repeated trials have been made of competing threshing-machines at our great agricultural shew, it was threshing-macmine as our great agricultura succes, it was not till the Nerwich Meeting in 1849 that a very singular discovery was made of their great imperfection. It oc-curred to the consulting engineer, Mr. Amos, that the draught of the common threshing-machine worked by horses, should be tested when empty; and it was ascer tained that some of the best 4-horse machines required no less than three horses, putting out their strength as when at plough, to keep the machinery in motion withent threshing at all. In ether words, of the four horses dragging round in their weary circle, three were overcoming the resistance of the machinery; nue only was coming the resistance of the machinery; me comy was threshing the own. Technically speaking, the duty per-formed was 25 per cent, ealy. So little, too, had the makers atudied the principle of construction, that this coormous waste of power was capriciously divided be-tween the burn-works and horse-wark. To quote Mr. Thompson, of Moat Hall, whose reports always show that he has mastered his subject-" The machines of Messrs. GARRETT and Woods furnish an excellent illustration of this point, the whole friction being in these cases 2:78 and 2.81—all but identical; the friction of the barn-works being, however, 2.07 and .46, while that of the horse-works was .71 and 2.35." Thus the makers were working so much in the dark, that, if the two best of the correlative parts had been put together, one horse in the four would have overcome the resistance, and the duty of trial. 75 per cent, would have been achieved; but if unfortunately the two werst had been mated, the resistance of the se machine would have amounted to four herses and a half before any corn was put in for threshing, and there

would have been ne duty at all.
The same rigid trial was applied to the threshing-machines above at Exeter in the following year. It then
all reduced their dead resistance from 2 for 1/1, er enchalf. Yet there was still found a vast difference in the
power required by the computing machines. For threshing 100 sheaves in a minime, the two extremest of prover
them which required triple power was inferior to that of

and climsy; and cast iron used freely in the place of wrought. The coal consumed for duty done was three times that in the best engines. Messer, Ronsomes and May brought an engine to the

that in the best engines.

Messes, Ransonice and May brought on engine to the
trial yard, but from some cause it could not be made to
work. It was a trunk cugine, which, in so small a power as
5-bose, weuld give rise to much extra friction.

the machine which required least power. This short summary of what has been done already seemed necessary in order to show the interest attaching to the following report by Mr. Thempton of the trial in the third year for the present occasion:—

1. Threshing methlers may be divided into two classes—these objects for team or water power, and them increade make the most of the continue of the many of the most object for the many of the most object of the many of

works. The recompanying tachear form shows the results obtained, which were extracted at the tacklosing way:— The recommengine electred to drive the three-laing meablines. The recommendation of the recompanion of the recompanion of the represented conselvers power. Cell 4 shows the set pressure of steam at which calculated from the data show methods. Cell 5 shows

At the close of the trials, two engines, via., Messrs, Garrett's and Messrs, Clayton's, were put through a second trial, to test the difference as stempenenting power between the Linugenneck coal nated in these trials and the best Newcastle, when the difference in favour of the former was found to be as 8:63 to 11:3 lbs. of coal burnt per horse-power per hour.

11. S. THOMPSON.

the comparative time of performing the same amount of the comparative time of performing the same amount of work. This, it should be mentioned, is not the observed time, but the time calculated from the registered revolutions of the engine. The pressure of steam and the number of revolutions per minute which were equivalent to the horse-power applied to each matchine having been sceralized, the whole number of revolutions made during the trial. the whole number of revolutions made during the trial, divided by the calculated number per minute, gave the number of minutes required for the performance of the work at the specified power and spect of drum. The figures in col. 6 represent the heree-power that would have been required in each case to do the work in one minute; and show therefore, at a giance, the performances of the several machines in respect of speed and power combined. The lowest figures represent the most estimatory results. Col. 7 lawest figures represent the most satisfactory results. Col. 7 shows the quality of the work done in respect of the three points of "clean threshing," "broken grain," and "state of straw." In cach case a number is assumed to represent perfect work, which is considered to bear a proper proportion to the imperiment of the point—on that the total number obtained by each machine, as shown in the lest column, may riy represent the comparative goodness of the work. The second trial was conducted in precisely the same manner as the first, the only change being that barley was

threshed instead of wheat. Those machines only were allowed to compute which had acquitted themselves satisfactorily at the first trial.

For the guidance of those who are not in the hahlt of For the galaxies of mose who are not to see mann or examining tabular statements, it may be useful to point our that the two columns to which attention should be particu-larly directed are those numbered 6 and 7—the latter belong the most important. On ascertsining by the "total" num-ber in col. 7 that a machine has done its work well, col. 6 ber in co.[†] that a machine has done its work well, co.[†] a should next be consulted to accertain whether under that should next be consulted to accertain whether under that head it received a high or low figure; if the former, it must be either slew in its performance or heavy in its draught; but, if the latter, it may be inferred that it had threshed when well, and the second trial would be referred to to ascertain its capabilities with respect to forty. An exami-nation of this kind will show that the machines which stand first in order of merit are those of Messre, Holmes, Hens-

mnn, and Garrett; and their performances having been in all respects satisfactory, Medals were awarded to each of then sem. The slaker attached to Messrs. Holmes's machine was receilly commended as being very efficient, and yet adding little to the draught of the machine.

SECOND TUIAL-BABLEY.

1. Garrett	160 32:00	1 27 8·72	20 10	8 33
	316 19:00	2 47 11·15	20 11	8 30
	168 28:50	1 20 8·19	20 12	8 40
	195 17:50	1 27 6·62	15 12	8 33

The difference, as shown by the Table, in the power regard by different threshing-machines for threshing a given quantity of straw, which was 1 to 3 at Exeter, is out much less now, being still as high as 1 to 2½. The speed, however, with which the straw is passed through the machine must not, of course be made the sole test of excellence. Clean threshing is a most material point, in which some muchious are very deficient, as is proved after rain by the grassy verdore of a straw-heap so threshed. Thus the easiest-working machine, Mr. Crosskill's, seems to have gained that case at the expense of its efficiency, as appears in the column which registers the eleanness of the threshing. On the other hand, clean threshing moy be threshing. On the other hand, etcan threshing moy be obtained by beating the sheaves too roughly, as must be the case with Mr. Hornsby's, which bruises the straw, and what is worse, breaks the grain. Still, the power required by the three prize machines averages only about 12, while the maximum of power required is just deable, namely 24, by Mr. Smith a, which, therefore, of course wastes half the power, whether of horses or steam, that may be applied to it.

A separate trial it will be seen, was made with barley.

sters io most counties refuse to boy barley unless threshed by the flail, because most machines bruise the grain, and destroy its power to germinate. The assertion that maildestroy its power to germanue. The saserino tous mani-ing barley could be threshed by machine, would in many parts of England simply be disbelieved. Yet where the best machines are used, the mainters no longer object to barley so threshed; so that it is most important to test all threshing-machines with barley. Enough, however, has been oow demonstrated to convince farmers that they should no longer huy blindly the threshing-machine which comes nearest to hand, buying thereby double or perhaps treble labour for the same or worse work, and leaving their barley, which is, probably, half their corn-erop, to the tedions work of the fluid though the labourers themselves begin to regard that work as too irksome, There remains only in this class of machinery to apply

Loug as the threshing-machine has been known, the malt-

the test of ecocomy, and compare the cost of threshing by flail, by horse, and by steam. In the two former cases the rick must first be removed into the barn by eight men, a boy, and two horses-I take the numbers as they bave been employed on my own farm, because it is difficult to 13/ 10+

ascertain such figures, and the comparison will at least be a fair one:-

Cost of barning - - 17 6 The price of threshing wheat hy flail varies, with the The price of threshing wheat hy flash varies, with the yield and the district, from 2z. 6d. to 4z. a quarter. Three shillings then will not be an unfair average. If the rick hold forty quarters, we must add 5d, for barring, and the cost will be 3z. 5d, per quarter. In threshing with the unimproved machines, I find on

inquiry that ueither my neighbours nor myself have hitherto got out more on an average than thirteen quarters a-day. The supposed rick would take, therefore, three days to thresh :-

4 women, at 8d		-			0	2	8
1 boy					- 0	0	6
4 horses, at 3s	-	-	•	-	0	12	0
					1	2	0
							3

3 days' threshing	-				3		0
Barning	-				0	17	6
					-	-	-

The whole system of horse-machines has cost us, there fore, 2s. a quarter. But improvement has been carried further: for steam-threshing we require additional hands, sixteen instead of ten, but we get over three times the work, passing the rick is one day, not three, through the machine. The figures on steam-threshing will be then as follows:—

1 engineer (head carter) - - - £0 2 6 10 mea, at 1s. 4d. - - - - - 0 13 4 5 women, at 8d. - - - - 0 3 4 Coals, 34 cwts. - - - - 0 3 6 £1 2 8 If we make up this sum to 30s, for the use of the engine,

the cost of steam-threshing will be 9d.; the saving as compared with hand-threshing, 2s. 8d., or with horse-threshing 1s. 3d.; an average of 2s. per quarter of wheat —a large saving certainly to be effected in one only of five main departments, but not larger, I believe, than may be shown to arise from the use of improved machinery in most, if not all, of the four other departments as well, It may be objected that credit is given for the value of the borses' labour: and though in valuations horse-work is often charged high, we are ant. I know, as farmers, to regard each particular use of horses as costing us nothing. This view may be even correct on small matters occurring at leisure seasons, but it would be false if applied to a demand like the present, large in itself, distressing also for the horses, and liable to occur at all times of the year. It can have no truth in it at all, when we endeavour, and by reformed implements in all other departments are enabled, to reduce the permanent staff of horses kept on the farm: fur this plain reason, that, if we do not carry the reducition throughout, we either press the horses unduly at one time, or require harses to be kept which are madeau at other seasons. useless at other seasons.

Since the trial for the Commission, a fresh trial has been made at Bridliagton. There the prize was awarded to a machine by Messrs. Clayton, Shuttleworth and Co., which not only threshes out 50 quarters in a day's work, but dresses the corn also to a great extent at the same time, yet requires, as the makers state, only fourteen hands for both purposes; not more hands, therefore, than we have employed to get out with our horso-machines, and afterwards dress 13 quarters:—

> Six men, at la.4d. -Six women or boys, at 8d. - - - -Coals, 5 cwts. - - - - - - -£1 9 0

If we add 7s, for wear and tear," we find the wheat to to we had 1s, for wear and tear, we may the whent to be threshed and wismowed for the almost incredibly low sum of 7d, only per quarter. Messrs, Clayton, therefore, have now taken the lead in the improvement of threshingmachines.

3. Winnowing-machines. Even winnowing is become a refined process; for instend of trusting the corn to the wind, it is now placed in a machine so discriminating that the best of these, Messrs Honssay's, required, on the part of the Judges at the York meeting, specific terms for describing its work more than are easy to understand; but the Judges' account is than are easy to understand; but the Judges' secount is for that very reason worth quoting:—"Several machines," they say, "were tried, but could not get through the grain, shorts, straws, and chaff, as it came from the three-ling-machines, without being choked or requiring much more time than Horanshy's, which did its work well, parting the whole into best corn, good tail, tail, whites, screenings, and chaff, at the rate of about fifteen quarters an hour, and dressing over the second time at the rate of above twenty quarters per hour, parting the whole into six parts, as before, in a workmanlike manner." Such masterly mastication and digestion, making the contents of our supposed wheat-rick, forty quarters, in five hours

resdy for market, must be appreciated by farmers; and Mr. Hornsby's winnower has not lost character at Kensington, as appears by the Judges' Report :-Winnering-machines.—Messrs, Hornshy and Son are, above all others, the mast successful in these machines, dressing more than double as much corn as any other in a rough state. Theirs is fitted with a spike roller, working through a gratlug, and forms a sort of hopper, separating the earn from the chaff in the rough paley state, as it conce from the threat-inc-mackine, without being previously riddled; and can be adjusted to sait earn citter in rough chaff or in any other state; the second time over, a slide-board is adjusted in the front of the grating, and is excellent for finishing the corn for market. We therefore awarded it a Medal. Price

Mr. Goocu exhibited a machine which did its work well, but too slow.

C. B. CHALLONER, The eorn being now fit for the miller, the task of a reporter on agricultural implements fifty years since would have ended; nor is it within this branch to enter

on the new process of grinding, by which the finest flour is produced from ordinary red wheat; but though the preparation of food for man belongs to another department, there is an entirely new class of implements be-longing to this Jury which must not be passed over. V. MACHINES FOR PREPARING THE FOOD OF STOCK. Formerly onr farm stock was fed with hay, or turned

out to pick over straw, sometimes with whole turnips thrown to them. But practice, anticipating Baron Lie-big's hrilliant discoveries in animal physiology, found that the labour of the jaws wasted the beast's muscle and thus retarded his progress. Our stock, therefore, are saved even from that exertion, and distinct machines have been invented for mincing each description of food with which the animals are made ready fur market. The most common of these is 1. The Turnip-cutter.

The test of inbour saved cannot, of course, he applied where the labour is applied to a new object. These machines, however, have recommended themselves to widely, that to prove their advantages is almost idle. Still it descrees mention that, in the opinion of good farmers, lambs fed with the aid of a turnip-cutter would be worth the country of the course of the c more at the end of a winter by 8s, a-head than lambs fed ou whole turnips, the cost of using the machine being but Is, per head, and of the machine itself 51, only. If this be true-and it has not been disputed-this simple instrument gives a saving of 70s, an acre upon the turnip crop, Hitherto the Banhury turnip-cutter has stood almost alone,

I am told that this would be a fair allowance for wear and tear on a farm of 500 acres, where the steam-engine is used for chaff-cutting, grinding, &c., as well as threshing.

thousands, I believe, being sold in the year; but in the Exhibition Building it has at last found a rival,

Turnip-enters.-Three of these implements were tried; that of Mesers. Burgess and Key is upon n different prin-ciple to those generally in use; their implement cuts a very large amount of roots for sheep and heasts at the same time. exceedingly well, and requires a very small amount of power. There is a great facility of changing any of the kuives that may become blunt or breken; and there is a very simple and ingustens method of letting stones or gravescape before coming in contact with the knives. Price 54. Both for novelty and usefulness we awarded it n Prize Medal

Mr. B. Samuelson (successor to the late James Gardener. Mr. R. Samnechou (successor to the late James Garcheers, Clashury) has very much improved that well-known in-plement. The framework is made of east-iron, light, pert-names the properties of the facility of getting at, repairing or adjusting the knives. Price 5C. We assured a rize Mrail. Surelported was tired, but could not compote allier in construction or work with the other two.

2. Chaff-cutters.

These instruments, which cut straw into very short lengths for feeding stock, are so called because there not being enough natural chaff for the purpose, artificial chaff was made in this way. At first the straw was cut in a rude box, with a chopper raised by the hand, and cost 2d. per basket; then with a circular movement, costing 2d, per basket; then with a circular movement, cosing idd; and may now be cut by steam-power at not much more than 4d, per basket. The process makes, too, an arable farmer independent of natural meadow; for sheep, it is well known, especially breeding ewes, require much dry food; but this artificial chaff mixed with rope-cake, takes the pince for them of hny, or hay may be ent with the straw. It is also worth while to cut hny, though consumed by itself. Even in the new circular chaff-catters we find a difference as to the labour required by them for preparing a given amount of chaff. The difference, indeed, was so great in the trials at York, that it is worth while to quote some of the figures :-

Weight of Power

A. t. 4. He. the. Corner - II O O 14,125 Did its work well. 112 Garrett-10 10 0 112 Crosskill 18 0 0 44,800 This machine made very rough work.

This table is most instructive; for we find here three first-rate makers staking their reputation in a public trial on their respective instruments, one of which nevertheless requires three men to do badly what another enables one man to do well. Surely farmers must learn from such results a more careful choice of their implements. It is due to the two makers last named to mention that the lesson was not thrown away on them.

Chaff-cutters,-Mr. Cornes, of Burbridge, has, in the trials at Kensington, mainjained his previous reputation for the greatest economy of power in proportion to the work per-formed; also the machines of Messrs. Garrett and Son, and Messrs. Smith and Co , of Stamford (171.), are worthy of the highest communication, the latter for an ingenious applica-tion of a spring lever to throw the rollers out of gear when starting the machine. To these three we have therefore starting the machine. nwarded a Medal, C. B. CHALLONER.

3. Linseed and Corn Crushers.

The same extraordinary disparity of power required was found also two years since, at the Norwich Meeting, in this class of implements :-

> required. Ibs.

Stanley - - - 112 W. Nicholson - 112 24,239 one; so that to obtain the same work four men must turn one machine, while a single labourer turns the other, Linseed and Corn Crushers .- Mr. Stanley, of Peterboron

at present stands unrivalled with this machine. By his recent improvement of a lever in front to relieve the pressure when the corn is first let in upon the rollers, he has perfected this machine, which was much needed, as machines on this principle have been made by various other makers, but have always been subjected to the inconvenience of being choked with the corn at starting. On these trials Mr. Stanley's machine required less power is drived it than others; and was, in consequence, awarded a Prize Medal. Mesers. Barrett and Exull's creater merits commendation,

Messrs, Garrett and Son have introduced some additional motions, and have thereby added considerably to the friction of their machines.

C. B. CHALLONER.

4. Oil-cake Bruisers. Not being able to procure the thick cake, the machines

Not being these to precure me them come, one amounts were tried with the small 3-th, caker, exhibited a machine, Mr., Nicholson, of Newark-on-Trent, exhibited a machine, the price of which was 5d, which this did its work very well. Messrs, ilorasby brought two very excellent machines (I think the larger one is to be preferred), breaking for beasts, sheep, and manure equally well. To each of these exhi-bitors a Prize Medal has been awarded. Others, on the same principle, were tried, but did not do their work so well.

C. B. CHALLONER,

5. Mills for grinding fine Meal.

Mills for privating few freed.—The best metal mills that have been produced for the operation are those of Mesars. Hurstood, of Daywich, and Mesars. Crosskill, of Beverley; that of Mesars. Hurstood, which is composed of a series of cutting rings served upon a cast-free paich, having the dress somewhat resembling the common millstone; the drift increased from the centre, to enable it to clear itself.

increased from the courte, to caable it to clear itself. The court court with its great advantage over the old mills. This mill did six bestiest of bearing per hour, with a power of a tittle more than tree boves, and it propietable to beats, a tittle more than the court of the propietable to beats, Mosens Croeklill's is an American Investion, consisting of a masker of caucition plates truesd up in circular of a masker of caucition plates truesd up in circular of a masker of caucition plates truesd up in circular guided, and faired accentric, which gives them a next of ellip. The mill requires great power, and should be driven at great speed. By changing the plates it will grind anything from lieseed to flur-stones. In the trials at Kensington it ground linseed, barley, beans, and outs very well. Price 28t. ground inseed, bariey, beans, and outs very well. Price 28t, We awarded it a Prize Medai. Mr. Bentali, of Woodbridge, exhibited a suntil steel mill, requiring very little power, which split beans very well, at the rate of ten pecks per hour, and deserves commendation.

Price 61, 6s. C. B. CHALLONER.

6. Gorse Braisers.

These implements have reached a high degree of per-fection, but whether their application has increased in proportion, or has been found profitable, there is no sufficient information at hand, Mr. Burrell's, of Thetford, did the most and the best

Mr. Burrell's, or ancincin, on the more man work; and although it consumed rather more power than some others in bruising the gorse, it did outs and limseed at

some others in brushing the gorne, it did out and lisseed at molecular aimoust of power. We therefore warsheld is a molecular aimoust of power, we therefore warsheld is a Messes, Harrett and Exall, of Reading, subhilded as Messes, White, of Hubbres, exhibited a median worthy of communication. Price 23. Amedican the Messes, White, of Hubbres, exhibited a but required to the communication of the power of th

the trials. C. B. CHALLONER.

7. Steaming Apparatus.

Besides the various modes of subdividing, it has been often preposed to cook the food of animals; but the prac-In fact this is the greatest difference we have found to spread widely, and the advantage must be yet in any machine worked by hand, being about four to regarded as doubtful, excepting as regards the steaming of potatoes for pigs; but even diseased potatoes, if not too far gone, by being thus treated, may be rendered good victuals and be stored up for mooths. It seems hardly worth while to set up capensive fixtures for this purpose only, especially as we have an excellent apparatus, Mr. STANLEY'S, which, like Soyer's magic stove, may be used when and where it is wanted. When tried at York, it when and where it is wanted. When tried at York, it heated 126 gallons of water, while another heated but 70, little more than half, with the same allowance of fuel; vet this inferior one had been the best two years before,

VII. DRAINING.

This last class of machines, those connected with draining, ought perhaps to bave formed the first class, inasmuch as draining is the only road to good culture on land which lies wet; but es much land does not require drain-ing, and as it does not belong to the reguler task of the farmer, but is a work to be done once for all by the landlord, the machines employed in this mode of improvement have been reserved to the end.

1. Tile Machines.

Twelve years ago draining-tiles were made by hand, cumbrous arches with flat soles, costing respectively 50s. and 25s, per 1,000. Pipes have been substituted for these, made by machinery, which squeezes out clay from a box through circular holes, exactly as macaroni is made at Naples, and the cost of these pipes averages from 20s. down to 12s. per 1,000. The old price was almost probihitory of permaneut drainage, excepting where stones were at hand; the new invention has reduced this permanoent improvement to a rate of 4l, or 3l, per nere, not exceeding in cost the manure given to a single turnip crop in some bigh-farmed districts. This result has been obtained by a most spirited competition among mechanics, as no less than thirty-four different tile machines com-peted in 1848 at the York Meeting. Since then the struggle has been practically between three only, on

The trial of Mr. Stanley's apparatus was overlooked accidentally, because a trial was thought unnecessary, there being no moveshie apparatus in competition; but the Jury having decided that no price abould be ewarded without trial, the oversight could not be remedied. There was also a fixed arearetus which could not have been tried.

which, in the present year, we have the following re-

Trial of Tile Machinery.—I recommend to the considera-tion of the Jury the Tile and Brick Machines of Mr. Clay-ton, Mr. Scragg, and Mr. Whitchend.

I first tested their capacity in screening the earth. The result of this trial was that in five minutes

I give the preference to Mr. Claytoo's screen, as it clear light the pertion rejected consisted almost entirely of small stones, &c.; whereas the screens of Mr. Whitebead and Mr. Scragg retained a large portion of elay.

and Mr. Seregg resisioned a large protion of elsy.

In the manufacture of large pipes, intellude in diameter, by bostnasia destrey and the use of a vylindrical base.

Mr. Seregg is much shapished the internal arrangement of bit matchine by substituting a claim for the reck and parameter of the protion of the state o machine.

A. HAMOND.

The pipes so made are placed under ground with narrow spades; but in the form of the narrowest spade, if I mey venture to speek from my own experience, it is clear that, so far as regards clay authority, a step has been taken backword in substituting a concave tool for the old trian-gular lance-heeded tool of Essea, with which fer more work can be done, by less exertion, too, on the part of the labourer. There is hope, however, that on clay soils manual toil will be superseded by the use of

2. The Draining Plough,

Bot for the American Reapers, Mr. Fowner's draining plough* would have formed the most remarkable featore in the agricultural department of the Exhibition. Won-derful as it is to see the standing whent shorn levelly low by a pair of horses walking along its edge, it is hardly, if at all, less wonderful, nor did it excite less interest or surprise among the crowd of spectators when the trial was made at this place, to see two horses at work by the side of a field on a capstan which, by an invisible wirerope, draws towards itself a low framework, leaving but the trace of a narrow slit on the surface. however, to the other side of the field, which the framework has quitted, you perceive that it has been dragging after it a string of pipes, which still following the plough's snout, that hurrows all the while four feet below ground, twists itself like a gigantic red-worm into the earth, so that in a few minntes, when the framework has reached the capatan, the string is withdrawn from the neckince, and you are assured that a drain has thus been invisibly formed under your feet. The Jury decided as follows:-

The implement went through the trial very well, laying in the titles with great apparent case, worked by two horses, with a capetan which was firmly and easily fixed into the round, and afforded a firm traction to the plough by means ground, and alteriors a minimum or the property of a wire rope and pulley. Progress has been made, since the implement was exhibited at Exeter, in rendering the level of the drains in a degree independent of the level of tha surface; but there is still room for further improvement in giving to the drain a uniform incline.

The award, therefore, of the Jury was Honourable Mention. Since that trial I have thought it right to make further inquiry into the work of the draining plough. In the first place, the trial drains were opened and laid bare from end to end. Straightness is of course one requisite, and the pipes were laid straight; closeness of contact another, and they were perfectly joined. In they were perfectly joined. In level, the point on which the Jury doubted the perfection of the work, there was some deficiency, which, on entirely fint ground such as this, was a decided fault. That fault, however, has since been remedied for clay land at least, As the plough was shown last year at Exeter, it could not possibly lay a level drain, because, its under and upper parts being fixed at any unvarying distance, any uneven-ness of undulatory surface must be faithfully copied by an andulating drain below. This year the two parts were so connected that the workman, by turning a screw, can raise or lower the underground snont which barrows out the drain. But at the trial the use of this serew depended on the workman's judgment, which cannot give the drain absolute accuracy. A balanced level, however, has now been added to the plough, by which the changes of surface are made plain to his eye. Other improvements have also been made in the implement. The horse-power re-quired has been reduced by a fourth, and the windlass at which the horses work need now he shifted only once in As to the economy of using the draining the day. As to the economy of ming use unaming plough, it is too expensive to purchase, unless for a large landowner, but it may be hired by the year or the month. Its inventor is also ready to excente work at his own risk by contract, at a saving of from one-third to twothirds on hand labour-the greater the depth, the greater being the saving. I have only seen the actual cost of two drainages that have been made by this plough. They were were both without tiles and shallow, being only 24 feet deep. Taking the highest of them, and adding the cost of tiles, the price of tile-draining land at that depth, and at 33 feet apart, would be 14s, only for work, and with 14-inch pipes, at 15s, per 1,000, 18s, 2sf, for tiles, all together 1f, 3s, 2sf, including horses and hire of machine, The plough goes as well, however, at a depth of 4 feet,

The machinery is made by Mesurs. Fowler and Fry, Templepate, Bristol.

nor coold the additional cost be material. The plough Depth ft. in I S with piper S O ditto. S S ditto without pipes. 40 from 2 ft. to 4 ft , with tiles. Mr. Harris, Bullington . . now working 3 &

has worked on the following farms :-

In clay subsails, with a gentle fall, the success of this new implement seems to be beyond doubt, and in all eir cumstances the inventor is ready to undertake the risk of the execution

In now closing this Report, I shall be permitted to sathat, although it is impossible adequately to valoe any prodoctive machinery without detailing its objects and estimating its power to diminish human toil, or to increase the results of that toil, I could not have ventured to enter so far into the practice of husbandry, but for the interest your Royal Highness has long taken in these parsuits, and, above all, from the high concern enterta by you in the welfare of that important class among Her Majesty's subjects to whom agriculture affords the means not of harmless or neefal amusement merely, but of anxious subsistence, not unnecompanied now with serious misgiving. A sure conviction, founded on no short experionee, that those new implements which in the great Exhibition afforded not the least complement testimony to the advance of English skill in devising mechanical means for the abridgment of labour, can practically afford to the English farmer, if rightly understood, important, easy, and immediate assistance, has emboldened me to easy, and immediate assistance, the consonance in a pursue the necessary chain of evidence with, I fear, tedious minuteness; but that minuteness will, I trust, be excused, if it shall have established any definite truths, which, as affecting the prosperity of so important a body which, he interest are property of so imposings a only of men, may be thought in some degree to claim even national importance; and the claim alone will, I well know, have secured your Royal Highness's indulgent attration.

It seems proved, then, that within the last twelve years, since annual country shows of implements were established by Lord Spencer, Mr. Handley, and others yet living, old implements have been improved, and new once devised, whose performances stand the necessary inquiry as to the amount of saving they can effect. To ascertain the successive stages of management, and seeing that the owner of a stock farm is enabled in the preparation of his land, by using lighter ploughs, to east off one horse in are tand, by disagg againer prongers, we cast our norse in three, and by adopting other simple tools to dispense altogether with a great part of his ploughing—that in the enlarge of crops by the various drills, house-labour can be partly reduced, the seed otherwise wanted partly saved, and the use of manners greatly economised, while the horse-hoe replaces the hoe at one-half the expense-that at harvest the American Reaper can effect nearly thirty men's work, while the Scotch cart replaces the old English waggon with exactly half the number of horses-that in preparing corn for man's food the steam threshing machine saves two-thirds of our former expense-and in reparing food for stock, the turnip-cutter, at an outlay of i.e., adds 8s. a-bend in one winter to the value of sheep
—lastly, that, in the indispensable hat costly operation
of draining, the materials have been reduced from 80s, to 15s.—to one-fifth namely, of their fornor cost; it seems to be proved that the efforts of agricultural mechanists have been so far successful, as in all these main branches of farming labour, taken together, to effect a naving on out-coings, or else an increase of incomings, of not less than one-half.*

* As mere reasoning seldom carries conviction, I may be ermitted to mention that whereas in estimates by excel farmers 12 horses are still assumed to he necessary for a farm of 400 series, though with improved farming, I find now that I can work 460 acres of a mixed farm with 8 horses, which are by no means confined to the work of the farm. Ps. P. This mixing of labour or expose, though large for makes a market present of special formation and makes a market present of special formation of callon, or he latiting of stocking. But it is important which prefer the same input in comparison of the callon which prefer the same input in comparison of particular When the climit and latiting-soulis were abeliaded. When the climit and latiting-soulis were abeliaded, which is the contract of the contract of the contract of the make of possible. In agriculture we key a few simple scale work of primiting possible and her and the contract one is business, which instead of the old wargons with three horses each, should buy one-borne suris, and the color improved makinery, would fast late, the could be contracted to the contract of the contract of the color improved makinery, would fast late, the could be contracted in the contract of the color of the color of the color improved makinery, would fast late, the could be contracted to the color of the color of the color of the internal color of the literal. It is therefore further demonstrated that color of the color

There is a further effect of machinery pays agriculture which has histories non-crotosics. The main difficulty which has histories how envelocities are main difficulty machinery has not folioparbae exord, it certainly has made histories are suggested to the surface of the sur

with I could add that the use of machinery has drawed a rangingly as its improvement. Still it has detensed greatly, as it shows the increase, not only a more an experiment of the country of the countr

But it must be further admitted, that few even of our best farmers, though they may possess the new im-plements, carry their use thoroughly out. It seems yet many farmers use the drill, and do not use the horseoe afterwards, the use of whieb is pointed out by the drill, while most farmers still use the plough previously, which the drill may have rendered superfluous. It is of coarse very difficult to give up old practices, but the result of the whole inquiry into agricultural machinery appears to be this, -that, insamneh as the new machinery effects a great saving of labour, and is also exceedingly inexpensive, giving also moderate certainty to a business proverbial for its precariousness, farmers ought no longer to bind themselves down by aneient customs in busbandry, but should consider at once bow these practices may be but should consider at once bow these practices may be reformed altogether, in order thoroughly to curry out the advantages of modern mechanics. They should look as much to a shed furnished with suitable implements as to their stables, remembering that the best of these implenunts, though it cost as much as a horse, may take the place of a horse; and, furthermore, when once purchased, does not like the borse, entail a weekly expense afterwards. That this extension as well as improvement will come to pass in the mechanics of bushandry there is no reason to doubt, nor that both have been accelerated by the opportunity for eareful study of agricultural implements which has been afforded during five months through their exhibition, ander your Royal Highness's auspices, among all the other products of human industry.

Norm.—In this Report it occasionally largess that as Exhibitor is named more than once in conserion with different articles he has brought forward as estitled to a Medal; as, however, no person can obtain more than on Medal in the same Class, that mark of distinction must be understood to represent the excellence of each of the objects

rd Wnorrester, 34 St. James's Piace. THE daties of the Jury upon Philosophical Instruments have been found to be very heavy, as indeed might be expected in a field so vast, --including instruments re-

espected in a neid so vast,—inclinding instruments re-lating to Astronomy, Optics, Light, Heat, Electricity, Mag-netism, Acoustics, Meteorology, &c.; in fact, all relating to Physical Science, collected by a large number of exhibitors. Astronomical instruments claim our first attention, the eahibitors of these, though few in number, have effected cantorors of trace, though rew in numer, nave enceted a most beneficial advance by the use of as few parts in their construction as possible; this is mainly observable in the British portion. The workmanship of those exhi-bited by Germany deserves the highest praise; the instruments are, however, few in number, and do not folly

represent German art. America claims particular notice by the application of electro-magnetism to the registration of astronomical electro-magnetism to the registration of astronomical observations, thus enabling the land to do the work of the mind. This method has the further advantage of enabling not to record the observations taken at widely separated Observations, the length of the wire used being immaterial; thus is established a means the best possible for the determination of the difference of longitude. Observatories so connected afford the means of performing the most delicate experiments dependent upon the appreciation of minute portions of time. This method has been recently used in America, for the determination of the wave-time of electrical currents; from which experiments it would seem that its velocity of propagation is much smaller than that determined by Whentstone,* Of nautical instruments, there are several exhibitors;

but with the exception of those of America by Engesson and Sr. Jons, there is but little novelty of construction. In surveying and levelling instruments, beyond some lmprovements observable in those exhibited by Austria, there is no novelty. In optics there are many exhibitors, and we

remark the improvement of optical glasses in England, France, and Switzerland, and that the construction of large discs of glass for telescopes, in England, promises large diese of glass for televeropes, in Engined, promises to and consideration optical power, and thereby used in an advanced control optical power, and thereby to the Distink new by fire the best. In physical sprine generally, Pennes is pre-ceimient, having exhibited a number of delicately-constructed instruments, none of the same kind because and in primises. There are many other classes of optical instruments to be specified horeafter. Because and in primises. There are many other classes of optical instruments to be specified horeafter. graphy,-and never before was so rich a collection of

graphy,—and never before was so rich a concernon or photographic pictures hrought together, the products of England, France, Austria, and America. Before going further, it would be well to inquire into the utility of the photographic process as regards its ap-plication to art and science,—and, indirectly, to literature, plication to art and science,—nod, indirectly, to literature,—by affording a faitfult transcript of authentic papers and original documents, upon which subsequent internal and historical research, must necessarily be greatly dependent. That photography is yet in its infancy, there can be little doubt; and it is more than probable that its present application, (which we believe to be well represented in the Establishica,) is no more its altinatura than the control of were the first applications of the telescope, shurtly after the chance placing of two pieces of glass by Jansen's children had led to its invention. Who, at that time, children Bad led to 16 invention. Who, at that time, could have predicted the important part that the instru-ment, based upon that discovery, was destined to play in the world of science? or have foreseen the excellence which it has since statisted by successive improvements— even now making,—and of which the Exhibition affurds

ample proof.
Viewing Photography in connection with Art, it may

Eminent amidat the exhibitors of calotypes, is M MARTINS (610, p. 1907), whose works we may say with MARTINS (610, p. 1907), whose works we may say with cretainty, have never been surpassed; their colour, arrangeused, and perfect finish, call forth the highest admiration this success is not confined to one class of delineation in particular, the individual works comprising his collection, being nearly all of equal merit.

seting hearty ain of eight interv.

On turning to the photography exhibited by the United Kingdom, we find LALDER (1966, p. 449) healing the Kingdom, we find LALDER (1966, p. 449) healing the heart of the LALDER (1966, p. 449) healing the training force that the latest of the latest threather by him into the various processes of the art by presenting the image direct instead of incerted; this is the distainability of the latest of t

^{*} The success of this application of photography must be dependent, to a considerable extent, on the object-glass of the telescope. The Report on Telescopes of other arconnections of the care consensurate with the requirements of photographic representations of this class.

Ress and Thomson, of Edinburgh (299, p. 839), are fairly entitled to attentive consideration from their sucecsaful use of the albumenized glass, which they prepare hy a process different to that adopted by M. Niepce, its originator, applying the albumen so as to ensure its even originator, applying toe automen so its to ensure its even distribution, upon which evenness the success of the picture is mainly dependent. The pictures in their collec-tion combine, with exceeding delicacy of execution, a richness of colour equal to that of Martens, but surpass him in the diversity of tints; the collection, besides em-bracing a long range of sepia tints and Vandyke browns, includes a small picture the colour of which it does, and as this is a hitherto unprecedented result, we are led to give it weight, and will, in another place, describe the process by which it is produced. Some details connected with the methods adopted by Messrs. Ross and Thomson, and kindly furnished by them, are subjoined.

The process for producing negative Talbotypes, on glass, is as follows:—The whites of two eggs, being a quantity sufficient for coating a plate of glass 12 inches square, are placed in a bowl, and cleared from all opaque particles; it is drops of a saturated solution of iodide of potastium are added for each egg, and two-thirds of a wine-glass of water for both,—the whole being then wine-glass of water for both,—the whole being then beaten np to a light froth and carefully covered up and left to regain its liquid state. The glass to be coated is well cleaned with a solution of pure water and sods, or potass, and rubbed quite dry with a silt rag. The mix-ture is then ponered on a evenly as possible, and flattening a piece of wire to the opposite corners, the excess of albu-men is poured off by turning the plate gently npside down; it is afterwards made to revolve before a clear fire, by a thread of worsted tied to the suspending wire; when the albumen begios to crack, the plate should be removed to a greater distance, and there suffered to remain until conally cracked all over. To render the plate so prepared fit for the camera, it is breathed apon, to give it a degree uf softness and to cause it to absorb as much silver as possible; it is then dipped (the prepared side undermost) very gently in a bath of nitrate of silver, prepared in the proportion of 60 or 70 grains to an ounce of water, the plate being prevented from tonehing the bottom of the essel by a piece of bent glass, or metal covered with wax. It is then washed in a large dish of clean water, by re-peated dippings, care being taken to keep the water running in the same direction. The plate is then placed in the camera, and if the pieture when taken, is to be immediately developed, a quantity of acetic acid is

socied.

The mode of developing the image is as follows:—a quantity of saturated gallie acid is poored on the plate, and spread evenly with soft cotton-wool, after which, when the picture has well appeared, a small quantity of mile acid is mived with the pitters of ellers another. gallie acid is mixed with the nitrate of silver solution. game and spread over the glass, which gives the development atrength, and renders it more rapid. At this stage of the operation, a solution of hyposalphate of soda (50 grains to an onnee of water) is poured over the picture, and carefully spread with clean cotton; the process is then conspleted by pouring some water from a jug very gently over the surface

The negative proof so obtained is transferred to paper by floating the latter on a solution of common salt (5 grains by Boating the latter on a solution of common sait (a grams to an unner of water) for a space of two minutes; it is then pinned up to dry and floated on a solution of nitrate of silver (70 grains to an ounce of water) for three minutes; it is then dried in the dark, and aftewards placed with its prepared side to the prepared side of the glass negative, and screwed in the pressure frame with a plate of glass below to ensure its close contact. The plate of glass below to ensure its close contact. The pressure frame should be surrounded with black boards to cut off the rays of light from the sides. To fix the impression, it should be first washed in cold water, then in hyposulphate of soda (100 grains to an nance of water) for 15 minutes. It is then washed once in cold water five or six times in boiling water, and finally suffered to remain au cutire night in cold water, so as to remove entirely the renaining hyposulphate of sods, which would, in course of time, eat out the picture if allowed to remain. The photograph thus obtained is afterwards mounted

upon card-board, and pressed on a warm plate of steel, to communicate a slight glaze, which may be considered an

improvement to its appearance. The process we have just detailed is good in many points, but defective chiefly in one-sensitiveness; every

effort to increase which has hither to been attended with a softening of the alhamen. This is a difficulty, but one which Mesers. Ross and Thomson will doubtless over-

The positives on glass are transferred and fixed in the usual manner (the albumen being mixed with salt instead of iodide of potassium), with the addition of pure plaster uf Paris, which being mixed with the solution is ponred on the face of the picture, and adhering to the albumen in a manner hermetically seals it, and thus effectually

in a manner necurency, preserves it from injury.

This admirable system is, we believe, entirely due to Messrs. Ross and Thomson, whose collection of Talbotypes amply attests the superiority of their method; and indeed, as is the case of Mr. BUCKLE (301, p. 840), of M. Marrays, or of any highly-successful photographist, it is but fair to infer that the superiority observable is their roductions is due to their improvement of the processes which they have adopted,

Whether the followers of Talbot will ever obtain a pro eminence over those of Daguerre, or vice perso, is a question for time to solve; at present the two systems appear in the British Department of the Exhibition to be equally well represented; the followers of each, with few exceptions, laying claim to some improvement or pecu-liarity of manipulation. For example, in addition to the cases already mentioned may be included those of MAYALL (pp. 439, 440), who calls attention to his crayon daguerreotype, an invention of his own, and BEARD (p. 440), whose type, an invention of this own, that Dekard (p. 440), whose pertent enamelied process is one of the very lew instances of a patent having been obtained for any improvement connected with this art. Great as in the astification with which we regard the efforts under fair perfecting the pro-cesses of Dagnerre and Tallot, will greater is that with which we observe experimenters divulging the processor they have adopted; the hithert all but total avoidance of patent enrolment must be considered a distinctive feature of this art, to which fact, doubtless, added to the ready of this art, to which fact, doubtless, added to the ready divulging of improvements, se chiefly due the rapidity by which up to the present time its progress has been characterized. The publication of each new process opens a fresh field of philosophical inquiry, gives to nan in-ereased physical knowledge, and may work great changes in his moral destinies,

We cannot pass from the subject of photography without alluding to a loss recently experienced in the death of its founder, M. Daguerre, whilst the Jury were engaged in their duties, and we feel it due from us not to let his memory pass unnoticed. In him was lost one of the lights of the age.

We now proceed to Electric Telegraphs, of which a great variety are placed in the Exhibition; many of them are remarkable for novelty of construction, and for imortant improvements. In the section devoted to their description we shall speak of them at some length When Oerten, in 1820, linked together the sciences of

electricity and magnetism, great hopes were entertained of the application of electro-magnetism to the movement of machines; and as in the Exhibition there are several arrangements for obtaining motive power in this way, we are far from despairing of its successful application to mechanical motion.*

When Faraday obtained the converse of electro-mag-When Faraday obtained the converse of electro-mag-netism, by induced electricity from magnets in motion, he originated magneto-electricity, and it is possible that its successful application to the purposes of the electric telegraph will supersede the use of galvanic electricity, the experimenta which were made befure us with the the experimenta which were made befure us with the magneto-electric telegraph were satisfactory.

The application of voltaic action, by coating the inferior metals with the superior, is shown in the Exhibition in some beautiful electrotypes and integlios; also in a recent

application.

The Planlineters exhibited claim some attention, there being several ingenious machines of this kind adapted to the determination of areas of plane surfaces by mecha-

nical means.

There are several exhibitors of air-pumps, who have exercised much ingenuity.

There are various machines for standard measures of

There are varous inscenies for ransmard measures of length exhibited, two of which are extremely beautiful. Calculating Machines claim some attention as a mechasical power by which the hand is made to do the work of the usind; and operous and long calculations, requiring much strained attention, are performed by turning a landle. Two such machines are shown, which performed well and accurately.

We cannot help recording how elearly the injurious effects of patient enrollments on section were shown in the effects of patient enrollments. The enrollment is a exhibited proved to be merely variations, for the avoidance of the infringement of patients. In many cases the subjects patiented were of a very trifling nature, but still further improvement. The great strange of photography, previously alluded to, and the perfection of the mereroops, and their proportions are of potential in con-

It was found that the instruments exhibited were, for the most part, coldered without any concurrence on the part of the exhibitors, for the representation of the state of sclene in their respective countries, and that therefore as it was uncless to examine the instruments of each country separately. In the following Beport we have, therefore, classified the instruments according to their use, including the contributions of all nations.

It is but right to say that some instruments inserted in the Catalogus have not been found, and that in other cases neither the exhibitor nor any explanation of the instrument were to be met with. We now proceed to describe the several instruments in

Astronomical Instruments.

It is to be knowed that this department of the Edition contains results of the blaster of the Fe sidelities contains results of the blaster of the Fe sidelities and the blaster of the Fe sidelities of the Fernander of the Ferna

But in those instruments which are exhibited, it is highly satisfactory to find the greater part of them cha-

racterized by exquisite workmanship, and a steady advance in their construction.

In Mr. Boas's greet equatorial, it will be seen that he afoliowed the example of the Astronomer Royal, by having every part of the instrument cast in as few pieces as possible, and has thus avoided all nunecenary serve econoccious. The casting of this instrument, by Mossrs. Bansonane and May, in a fine piece of work, The same principle of easting has been adopted by Mr. Simms, who of the instrument of the control of the instrument of the cast of the control of the instrument of the cast of the control of the instrument of the cast of the

It is most gratifying to perceive that, small as is the mamber of autronomical instruments, the credit they reflect upon the artists is very great; thus, the instruments exhiinated by the Seams possess points of this interest, var, the theory of the state of the state of the state of the seeper; the application of the principle of vertical collisions to to the activate and arisinth instrument by pieceing the vertical axis; the adapting the axis of an equatorial to the certification of the principle of the state of the principle of the state of the state of the state of the principle of the state of the state of the state of the great service for the purpose of observation.

In the German instruments of Merz and Ertel there is exquisite workmanship, well maintaining the oelebrated names of the makers of the Poellova instruments. The divisious of the Ertel instrument are beautiful; but works of this kind, performed by hand dividing, are

operous and distressing.
The practice of hand dividing in this country is now almost superscied by machinery. Mr. Simme Instruments, for the most part, have been so divided. The advantages of this method cannot be better shown than in the comparison of the time overpied by the division of the strength of the division of "Wortbury circle," and the time now occupied in performing the same piece of work.

The grobustion of the two circles of the Weebery instrument ecopical Mr. Simms, is the has informed us, northy testive works of six days each work, and, on an formal by limighth, in a room otherwise complexity darkenel; and sithough precise enabled him, on subsequent economics, not accomplain risingle series of work; in executingly anxious and oppositive shour. By the means of Mr. Simmal self-scring dividing regime, "the series graduation is effected in five boars, to which length of accountries of the instrument of the instrument.

upon the engine preparatory to cutting the divisions. Thus, the same work is done within ten hours which formerly occupied from five to six weeks, not to mention the saving of wear and test upon the constitution of the operator. The divisions are found to be fully as occurred as those eat by the original process. The think macrieau Department, Mr. Bond exhibits the

electro-magnetic apparatus used succonfully by the Americans, both for the purposes of geodesy and astronomy; this American invention promises to be a real improvment in practical astronomy, and will, in all probability, forms a new car in astronomical observations.

DOLLOWD (145, pp. 496—425, and see Illustration). A variation transit instrument. The horizontal eirled is 21 inches in diameter, on which is faxed a smaller eircle of 7 inches diameter; each is divided to every 10°, and the larger eircle has three vertients, reading to every 10°. The

This beautiful machina is described in the 15th volume of the Royal Astronomical Society.

† The dividing the foot must circle at Cambridge, which Mr. Simms gruduated on Its pier, excepted his reveral weeks; see the results of the examination of the distance of the cambridge of the circle of the cambridge of the distance of the Boyal Observators, "Greenvich Observations," which was the Boyal Observators, "Greenvich Observations," which was considered transit circle their precision of Greenwich, "Greenwich Observations" for 1851. Both these which "Greenwich Observations" for 1851. Both these distances of which by Mr. Simms' circle weight of Wilson goldine, or divided by Mr. Simms' circle weight of Wilson goldine.

telescopes are 14 inches focal length, and 1.3 inch aperture, with altitude circle and the regular transit series of spider lines, supported upon four pillars fixed to the horizontal circle.

When the instrument is used for determining the actual or diarral variation, there is a cover containing a least, which is applied in front of the object glass of the telescope for reduling off the divisions on the needles, of which there are two, 7 inches in length, together with various ey-pleces, &c. The instrument is supported on a strong

triped with adjusting screws.

Sixms (741, pp. 4758—477*). A transit instrument, intended for use either in the meridian or prime vertical. The telescope and axis are of the form usually employed for this class of instrument, vist, two stout cones are connected by a sphere into which the cylindrical tubes of the telescope are screwed; the pivots are of hard bell-metal.

and are both perforated.

The object-plass has an aperture of \$\frac{3}{2}\$ inches, and a focal length of 44 inches; the displangem is furnished with secron vertical and two hardrants ingide-lines. There with the control of the con

The axis of the instrument is converted into a telescope, by having an object-glass fitted into one of the pivots, and a sliding tube carrying an adjustable cross of delicate suder-lines with a positive expenses to the other.

spider-lines with a positive eye-piece to the other.

The adjustment of this axis telescope is effected by a small collimator placed in a line with the axis-(nuless a distinct mark can be seen through it),-and then turning the axis round, and moving the proper screws until the intersection of the lines remain stationary opon the mark, or collimator cross, during an entire revolution. If the principal telescope be adjusted to the meridian, the mark seen through the axis will be 90° distant in azimuth, and seen through the axis will be 90° distinst it azimith, and by its means the instrument can immediately be placed in the prime vertical, for the determination of the latitude by observation of stars near the zenith. By this invention the form of the pivots may be examined, for if they be not circular, the error will be shown when the cross is being adjusted. The azimnthal adjustment is provided with a micrometer head, showing seconds of are, so that when the deviation is of known amount, the instrument may at once be placed exactly in the meridian. a complete observation of a star in the prime vertical, it is necessary to reverse the instrument, quickly and deli-cately, for a slight concussion might disturb the adjustments, and consequently vitiate the observation. this purpose a reversing frame has been contrived and fitted to the base of the cast-iron stand, or support upon which the justrument is placed. It consists of a strong serew having square threads, the circumference of which fits into a cylindrical hule bored through the centre of the stand, and is prevented from turning round by a key which fits into a groove cut longitudinally throughout the length of the serew. The serew is raised or depressed by a pair of bevelled wheels, one of which fits upon the screw and the other is worked by a winch handle. Above the screw a stage is fixed, and upon this two conical pillars are erected, having a fork covered with vulcanized India rubber upon the top of each of them. Upon turning the winch, the screw is raised, and the forks are brought into contact with the transit axis, and by continuing the motion, the instrument is lifted out of its Y bearings. The frame with the instrument is then, by means of stops, which are attached to the stand, to be turned 1803 in azimnth, and then by reversing the motion of the winch, lowered again into its bearings. Two setting circles of 4 inches diameter, and divided to one minute of are, are attached to the cyc-end of the telescope, both of which, reviously to an observation, should be set to the zenith distance of the star, in order that no time be lost after reversing the axis, in again directing the telescope to the object.

The stage is forced newards by means of four spiral springs, which rest upon the base of the stand; these are sufficiently strong to support the whole weight of the instrument when lifted, so that the friction upon the most parts is very inconsiderable.

The eye-pieces with this instrument are six in number,

The eye-pieces with this instrument are six in number, namely, five direct, magnifying 40, 53, 86, 120, and 140 times, and for scaith observations a diagonal eye-piece, magnifying 90 times.

Dolloon (145, pp. 486—428, and see Illustration) has exhibited an altitude instrument, with two circles of 2 feet diameter divided on silver to every five minutes, each circle reading off to seconds by means of two micrometer microscopes attached to the cones which support the instrument. Two small circles are fixed towards the eve

end of the telescope, each of which reads off the minutes by verniers, with levels for setting the instrument in altitude. The telescope is of 21 inches aperture and 32 inches for al length, and is fixed between the two large circles. There are five vertical and three horizontal spirit levels in focus of the object-glass, also various eye-pieces, &c.

The instrument is supported in Ys fixed on the top of two strong cones, which rest on a circular metal base, with differential screws for levelling. The usual method of illuminating the webs through the axis of the instrument is adopted. There are also two fine spider lines

reading to seconds.

Mr. Dollond also exhibits a double altitude instrument for observing by reflection and direct vision* (Cat. supri). The altitude circles are 1 foot in diameter, divided to 200 and are read off hy micrometer microscopes showing seconds. Each circle has a telescope of 15 inches focus and 1.3 inch sperture attached to it, and there are two small circles, read by verniers, for setting the instrument in altitude.

in altitude. The azimath eirele is 1 foot in diameter, and reads off by verniters to every 10°, having a telescope fixed under-neath as a check opon the instrument when taking hori-rontal angles. The axes of the circles are perforated in the ossal manner for illuminating the spider lines. The instrument is furnished with fine spirit levels, eye-

pieces, &c Simms (741, p. 476*). A transit circle, the telescop of which has a focal length of 4 feet, and an aperture of 3.25 inches, furnished with a micrometer in the eye-piece, and magnifying powers of 63, 102, 130, and 165 times. The circle is 2 feet in diameter; it was cast in one piece, of bell-metal. It was divided by Mr. Sinma' self-acting engine into spaces of 5' of are, and subdivided into single seconds by micrometers, of which there are two, fixed to

the stone piers which support the instrument.

In addition to the finer graduations, there is another strong circle of divisions, which are cut opon the bell-metal, and numbered to four times 90, showing either altitude or depression. These divisions are read by a sointer, and they serve to direct the telescope to the object, whether it be seen by direct vision or by reflection.

The Y supports are fixed upon the stone piers. of the Ys has a vertical adjustment for levelling the axis, which is performed by means of a striding level, and the other has an adjustment in azimuth for adjustment to the meridian. There is also a lever counterpoise fixed to that end of the axis near to which the circle is fixed for the purpose of equalizing the pressure of the pivots upon their respective supports. The instrument is furnished with an embracing clamp, or one which lays hold of the axis, ference, and also with a tangent screw, which exerts no lifting power, and has, therefore, no tendency to disturb the meridian position of the telescope.

The arrangement for the illumination of the wires is culiar, and is the invection of the Astronomer Royal; but it was greatly facilitated by adoption of the peculiar method of graduating the light in the field of view, which had been practically introduced by Mr. Simms.

The illuminator, which is, as usual, placed near the centre of the transit axis, and receives the light through one of the pivots, turns upon an axis in order to change its angle of inclination with respect to the eye-piece. By this change of inclination the quantity of illumination is regulated; and if the plane of the reflectur be placed perpendienlar to the axis of the telescope, no light whatever will be reflected from it. Upon the reflector one or more prisms are so placed as to receive the light from the lamp when the reflector is in darkness. These prisms reflect the light when the reflector is in the position above menthe light when the reflector is in the position above men-tioned, but at no other time, to other prisms, which are fixed in the eye-end of the telescope, near to the disphragar; and by these last prisms the light is thrown obliquely upon the spider lines, and produces the effect of illumi-nating the wires on a dark field. To the edge of the reflector a wire is attached, which terminates in a small knob, or handle near to the eye-piece, and therefore, near

* See "Astronomical Society's Papers," Nev. 24th, 1823.

the observer's hand. The only operation required in passing from one state of illumination to another, with all the intermediate gradatious, is either to draw out or to push in a knoh ur handle through a space of one or two tuches.

By these arrangements power is given to the observer to regulate the quantity of light in the field of the tele-scope, from the faintest gleam, by which the wires are just made visible, to the full illumination, and also to change instantaneously, as circumstances require, a bright field and dark lines to a dark field and bright lines. This change has hitherto been effected by the employment of

two lamps, one placed near the perforated pivot to give the ordinary illuminated field, and the other to nucly occasionally at the eye-end of the telescope, very nearly in the plane of the disphragm, so that the light passing through a slit obliquely across the field of view, illumi-nates the lines which intercept its passage, leaving the surrounding field in darkness. It is clear that the change from one kind of illumination to the other with these arrangements, requires some considerable time, and the hanging a lamp on the eye-end of a telescope of such an instrument as a transit circle is exceedingly objectionable By the new invention one immoveable lamp either illumi nates the field or the wires, and the same lamp, at the same time, also illuminates the graduated circle by means

same time, also illuminates the grasuastu three of more different properties. On the press attached to the micrometer microscopes. This instrument has also another improvement, which was suggested by Mr. W. Simms, jun., since the crection of the transit circle at the Royal Observatory, Greenwich, and a continuous cont It is by the perforation of a hole, about one inch and a half in diameter, through the centre cube of the axis, at right angles to the axis of the telescope, in order that a north and south collimator may look into each other without lifting the instrument from the Y bearings, and by this means very much simplifying the act of adjusting the line of collimation.

Ross (254, pp. 435, 436) exhibits a large equatorial.
The focal length of the telescope is 18 feet, and the
aperture is 11g inches. The diameter of the hour-circle
is 2 feet 3 inches, and that of the declination circle is

2 feet 8 juches. The instrument is supported on a round cast-iron pillar 10 feet 9 inches in height, 2 feet 3 inches in diameter at the bottom, gradually decreasing to 1 foot at the top. It is formed of two portions, fastened together at the height of 4 feet 6 inches from the bottom of the base, by eight screw-bolts and nuts, passing through flanges, 3 inches in width, from the shaft of the column. This joint affords the means of an approximate meridian adjustment. The base of the pillar is 9 feet in diameter.

The polar axis is of cast-iron, 6 inches in diameter, and 5 feet in length; it is connected to the declination axis by a flange of 18 inches in diameter. The length of the inner male declination axis is 3 feet 6 inches between its inner male declination axis is 3 feet 6 inches between its bearings; and the outer or hollow axis is 7 inches in diameter. Both are of cast-iron. The inner axis and its finge form one casting with the central hollow eyiloder, to the flanges of which the corresponding gun-metal flanges of the telescope are bottled. The table is of copput fatting learnings of the declination axis are cylin-drical, and the axis is secured by a seed cellar st inches in

length, fistened by cross pins to the male centre at the end to which the circle is fixed. In the inner axis there is a counter-sunk cavity to receive this collar, and a second counter-sunk cavity, of large diameter, to receive a steel plate, which is fastened against the end of the steel collar by eight steel screws. By this means the end shake of

the axis is adjusted.

The declination circle is of gun-metal, and is regulated by an endless screw, having an eccentric lever attached to a dovetail slide for gearing, and a pair of bevelled wheels at either end fur Hooks' joint adjusting rods. There are, also, two other radial arms, with clamp screws, for securely fixing the telescope to the circle.

The upper part of the polar axis fits into a coupling block, having a hemispheric bottom; this is supported by an augular projection from the top of the pillar having a corresponding nearly hemispherical cavity, and the whole is bound together by bolts and nuts, having spherical

249

faces, which bear in corresponding cavities in their washers;

the bolts pass freely through the holes The lower end of the polar axis is a hemisphere of hardened steel, bearing in a hardened steel dye, surrounded by an oil-cup, which is attached to dovetail slides having motions in rectangular directions, which are supported by a very strong bracket, projecting from the main column, and are applicable to the final adjustment of the polar axis

The hour circle is moved by a weight and train of wheels, regulated by a Siemen's governor, the ball being Wheelt, regument of surprings suspended by four springs.
This instrument reflects high eredit on its maker; it is

distinguished by solidity of structure, good mechan and distribution of strength.

Also, an astronomical telescope of 3 inches in diameter. 42 inches focal length, mounted equatorially. This telescope, on examination, was found to be a very superior instrument, and is the best in the Exhibition for its size. Also, an astronomical telescope 24 inches in dismeter, and 30 inches focal length, mounted on a pillar and claw stand.

Simms (741, p. 475*), an equatorial, generally of the Francehofer form, with the polar axis elevated for latitude 25°, formished with a clock motion for counter the effect of the earth's rotation. The focal length of the telescope is 7 feet, and its aperture is 4-9 inches: it is furnished with illuminating apparatus, a set of negative cyc-picces, magnifying from 60 to 450 times; a parallel line position micrometer with position circle, res one minute, and a transit eye-piece, the use of which is to facilitate the greeral adjustment of the instrument, and also for making observations for time, in the absence of a

transit instrument. The hour circle is 18 inches in diameter, and is read to one second of time by opposite verniers. The edge of this circle is ratched to fit the teeth of a screw, which is in connection with the clock before mentioned.

The declination circle is 18 inches in diameter, and is

read by opposite verniers to 5" uf are. The slow motion is hy an ordinary clamp and tangent screen.

The action of the clock is under the government of a

rotatory pendulum, similar to the governer apon a steam-The only peculiarity in this instrument is in the de-The only peculiarity in this instrument in in the de-elination axis, which is not covered up, but open, and exposed between its two supports. The open part is turned cylindrical, and can be set horizontal by a striding level, similar to that of a transit instrument. This construction has several advantages over that in common use; it simplifies the adjustment and the rectification to the meridian, and adapts the instrument for use in the taking of transits, where extreme accuracy is not needed, and greatly adds to the value of the instrument.

Mr. Simms also exhibits a small equatorial, adapted for

the latitude of London, but without clock motion. This estrument is upon the same principle as the preceding; it is understood to be inexpensive, but as far as its size permits, it is an effective instrument. The focal length of the telescope is 46 inches, and its aperture 3½ leoches; it carries a parallel line mierometer, with powers of 50, 90, and 150, and the telescope is furnished with an illumi-nating apparatus. The hour and declination circles are ies in diameter; the former is read by vernier to one second of time, and the latter to one minnte of are, with

clamps and tangent motions. The instrument surmounts an iron pillar, with a tripod stand, and there are screw adjustments, both for elevati the polar axis to the latitude, and for correction to the

The open declination axis and riding level occur in this rument as in the former.

DOLLONN (145, pp. 475—477), a poetable equatorial, made for the late Capt. Kater, F.R.S. The object-glass of the telescope, which is 30 inches focus, and 4 inches aperture, is worked from a formula of Sir John Herschel's aed performs extremely well. The instrument is sup-ported apon a strong folding tripod, is furnished with divided circles, a finder, levels, and a complete set of eyepieces.

The instrument is well adapted for seeking for comets. SIMMS (741, pp. 475, 476). An altitude and azimuth in-strument, known as the Westbury Circle.* The diameter of the altitude circles is 30 inches, and that of the azimuti circle is 24 inches. The divisions are cut upon a hand of silver fitted into each circle, aed situated near the circum silver fitted into each circle, aed situated near the circum-ference. The method adeepted in graduating these circles was that invented by the late Edward Troughton, Eq., F.R.S., and described by him in the "Philosophical Transactions," t as a method of dividing by the eye, to distinguish it from the old method of dividing by the

The circles are divided into 300 degrees, each degree into twelve parts or spaces, and these are again subdivided to single seconds by two micrometer microscopes placed diametrically opposite each other opon both circles.

The microscopes for reading the altitude circle are

fixed to the opposite ends of an arm which revolves about an axis concentric with, but perfectly independent of, the axis of the circle, which arm can be fixed in any position at pleasure. This contrivance, which, in effect, same as the power of changing the position of the telescope upon the moral circle was, we believe, first applied to this instrument.

The microscopes for reading the azimuth circle are fixed immoveably

fixed immoreably.

The azimuth axis descends within the pier to a depth of nearly three feet, and turns apon a steel point within a concainal hole: the apper end of this axis is sopported within a rectangular Y by openings opposite the point of bearing, and the axis can be corrected in regard to verticality by adjusting servers, which act upon the frame in which the Y is fixed.

The azimuth circle is screwed to conical radii which spring from the azimuth axis near its upper end. The altitude axis resembles that of a transit instru

and the disphragm is illuminated through one of the pivots in the usual manner. From the central zone of the axis two sets of radiating cones diverge, and to the ends of these cones the circles are screwed, one on either side of the telescope. These circles are connected by cros pieces around the circumference, where they also lay hold of the telescope, which is thus secured against any consi-derable flexure, and the cones are braced agether by two inscribed squares of brass, one upon each face of the

The object-glass was made by the late Charles Talley: the diameter of its aperture is 2.7 inches, and the focal length is 36 inches. At the eye-end there is a disphragm length is 36 inches. At the eye-end there is a disphragm of the ordinary kind, with five vertical and five horizontal spider bues. The eye-pieces consist of both direct and diagonal, furnished with magnifying powers varying from

The transit axis is adjusted by means of a spirit-level; there is also a spirit-level applicable to the telescope for giving the horizontal poiet, and a plumb-line apparatus is fixed to the column by which the micrometer support is need to the common by which the micrometer support is carried, and serves as a watch apon the stability of this important part of the instrument. The construction of this instrument is light and elegant, and, as experience has shown, it is capable of giving results of a high degree of accuracy; but the modern plan of ferming astronomical instruments of as few pieces as possible, of which Mr. Simms has given specimens in the alt-azimuth and great transit eircle at the Royal Observatory at Greeowich, is fast superseding the more elaborate, and if not less accute, certainly less durable construction.

This beautiful instrument was made by the late Mr.

Edward Troughton, at about the beginning of the present century, for Mr. Pond, the late Astronomer Royal, who, by the observations he made with it at Westhury, demonstrated the change of figure of the great mural quadrant then in use at Greenwich. After long exposure to the infinence of the atmosphere, and consequent deepy, it was in the year 1823 repaired and re-graduated by Mr. Simms, the Exhibitor.

* For a full description of this instrument, see Pearson's Astronomy," vol. ii., pp. 419-434. † See the velume for the year 1809.

Simus (741, p. 476*). A portable altitude and azimuth instrument, with circles of 15 inches in diameter, having a telescope of 24 inches focal length, and of 1.9 inch aperture, with two direct eye-pieces, of powers of 35 and 60, also a diagonal eye-piece magnifying 40 times.
This instrument is of the most recent form. A strong

brass triped supports the superior parts, to the centre of which the azimuth axis is fixed, and the azimuth circle is

serewed upon its face.

seres we tupon its face.

A strong plate circulates apon the azimuth axis, earrying two pillars of massive proportions, by which the altitude circle is supported. To these pillars the azimuth microscopes are fastened, and one of these pillars earries two conical branches at its upper end, for the purpose of holding the microscopes by which the altitude circle is read, and a sensitive spirit-lavel is so placed as to detect any instability in these branches, and to give its amount The telescope and axis are formed like those of a in are. The telescope and axis are formed like those of a transit instrument, and two circles are on each side of the

telescope, braced together with it by intervening pillars.

The circles were graduated upon Mr. Simms' self-acting engine, upon rings of silver, and the subdivision is made single seconds of an arc by means of two opposite micrometer readings upon each circle. The microscopes

of this instrument have achromatic object-glasses.

The transit axis is adjusted by the usual standing level, and each circle is fitted with a clamp and tangent screw

The novelty in this instrument is the introduction of a central collimator, n ready means at all times of deter-mining the nadir point: this important addition is the invention of Mr. Simms,*

The invention consists in placing a small achromatic telescope in the centre of the azimuth axis, which is perforsted for its admission. It is furnished with a cross of delicate spider lines in the focus of its object-glass, and has suitable adjustments.

If the principal telescope of the instrument be directed to the collimator, an image of the cross lines of the latter will be seen upon the disaphragm of the former, and as the collimator remains at rest, being in firm connection with the tripod apon which the instrument stands, it follows that if the superior parts of the instrument be turned round in azimuth, the axis of the two telescopes may, hy adjustment, be made to remain perfectly coincident during an entire revolution

If, in this state of things, the azimnth axis be set truly vertical by means of the spirit-level, which is fixed upon the instrument, the centre of the collimator becomes a nadir point to which all observations may be referred.

This point has additional uses; for instance, in performing the colliusation adjustment of the telescope, and in setting the altitude axis of right angles to the aximuth axis, and would consequently supply the place of the transit level, if by accident the latter were broken.

The importance of this invention, especially to the scientific traveller, is obvious; several such instruments have been made by the Exhibitor, which are in use in the Boundary Survey of the United States, and on other similar services

Fur the several inventions in these beautiful instruments, the Jury voted, unanimously, the Conneil Medal to Mr. Simms, which award was nlso passed manimously by the Group, but was not confirmed by the Council of heirmen, and therefore Mr. Simms will not receive that kind of Medal to which the Jury considers him fully

CRICKETT (267, p. 437) exhibits a model of a stand for mounting an equatorial.

Entral and Son (2. Zollvercin, Bavaria, No. 25, p.

1099,) exhibit a portable universal instrument, with hor zontal circle of 15 inches in diameter, and two circles of altitude of 10 inches in dismeter. The horizontal circle is divided to two minutes of arc, and is read by two meter microscopes to seconds; it is also furnished with four verniers, which read to two seconds. The divisions are fine, clear, and distinct. The circles of altitudes are well divided to four seconds of arc. The two reflectors for illuminating the division under the microscope are so made as to receive light from all sides.

All the clamps are applied to the centre to prevent any bending of the spokes, or affecting the figure of the circle.*

On fixing the lower elamp, the instrument was found to be absolutely fixed; and in this state was capable of being used as a transit circle. The level was made to rest on three bearing points; it is good; and when placed on the instrument no motion of the vertical circles affected the horizontal fixity of the instrument, or vice verse

The horizontal circle is, in fact, composed of two concentric parts in the same plane; - an inner one, which moves on its own pivot, and revolves, without touching the outer part of the circle, and each moves indepen-dently of the other. The centring of these circles is

This is a telescope of security, and which has its own motion, and can be set upon any object; and the fixity of the instrument when thus tested was found to be quite astisfactory.

At the intersection of the telescope with its horizontal axis is placed a right-angled prism. By internal reflection at the hypothenisal surface of the prism rays of light coming from the object-glass are reflected towards one end of the axis where the eye-piece is placed, so that in all positions of the telescope the observer looks in a horizontal direction; on the other end of the ungle is a graduated circle of to inches in diameter, with four verniers (in the same plane as the graduated limb of the circle) each reading to 4". The vernier circle carries a level moveable round the axis of the vernier circle, and capable of being elamped to it in any position with the level fixed: a double senith distance of any object may be observed no one part of the limb. The level may then be fixed in easy other position, and the double neuth distance measured on any other part of the limb,

The supports of the horizontal axle of the telescope rise from a strong horizontal piece of metal, to which is attached a vertical steel axis, passing through a vertical cylinder-terminating, below, in a tripod with foot screws. The steel axis carries a horizontal circle, graduated by a line at every three minutes, and also two arms carry micrometer microscopes. The vernier circle (15 inches in diameter) has a hollow axle which fits on the outside of the cylinder through which the axle of the versier eircle passes, and is capable of being made to revolve in its own plane. Attached to the end of the vernier circle is a check telescope with a vertical wire moveable by a micrometer

SCIPW The vernier circle is graduated by lines at every Iwo minutes. This graduation is read to seconds by each of the two microscopes. The vernier eircle being capable of revolving in its own plane, horizontel angles may be measured on different parts of the ares, by both the verniers and the microscopes. The microscopes have two wires very close to each other parallel to the division in the centre of the field. In observing, the image of the divi-

* The axio elamp, as used by Troughton, is essentially different from that employed by Errel. With Troughton it was a matter of convenience: with Errel it is considered 1s was a matter or convenience: with Ertel It is considered findispensable in urder to obtain necurate observation. It is need for the horizontal circle of the Westbury circle, while the more important part, the vertical circle, has a clamp on its limb. In the Westbury circle the extremity of the arm of the clamp is fixed in the diversion of its length as well as in the direction perpendicular to its length. This, in the case of the Westbury circle, strains the vertical axle. In the case of a transit instrument, it either bends the axic downwards, or lifts it out of the nearest Y, so that it touches one side of the Y only, or rocks from side to side. In the Munich instrument the axle clamp has an polished surface, which is made to press against the ead of a serew by means of a spring or the tension of a spring by which a weight is suspended, and is neted upon by no force in the direction of the length of the arm. I find these clamps recorded as new in notes made during a stay at Munich. — W. H. M.

[&]quot; For a full description of this invention, see the 15th of the "Transactions of the Royal Astronomical Society."

sion is made equidistant from the two parallel wires. The axle of the telescope has a striding level for determining its horizontality.

Troughon objected for repetition in large instruments. Zach and liberaberger had shown that repetition introduced errors larger than those it was intended to correct in well-graduated vertical crices. Server found that even better to measure the angles on different parts of the area for the constructed to measure the majes on different parts of the area for repeat. Accordingly, this instrument is constructed to measure borizontal angles and double aculit countracted by Erleichenkach and Errick, the circles were countracted by Erleichenkach and Errick, the circles were

made to clamp at their circumfrence.
In a naiveral instrument having a horizontal circle of
24 inches diameter (used by Struve as the principal instrument for the triangulation for the Russian are conmental to passing through Dorpati, when champed at the
circumfrence and the condition of the concircumfrence and to lead through as angle of such
circumfrence and to lead through as angle of my and
yet of the condition of the

vertical and horizontal circles of the instrument.

The heads of the foot screws are graduated; this facilitates the operation of levelling the instrument, and also cualites the observer to measure the angle corresponding to a division of either of the levels.

The short change at the extremity most distant from the sack have fit amplies of poished steel. This surface is pressed by a spring against the point of the slow motion serve. By this contrivance the sale is prevented from rotating, without the danger of straining or bending it, sopfitting a horizontal axis out of its, which night inches, as in the other contribution of the change were there, as in the other contribution of the change were there, as in the It is called a "naiversal instrument" because it is a It is called a "naiversal instrument" because it is

It is called a "interest installed to measure resist distances and horizontal angles. It is the invention of the firm now represented by Eriel.

The double wires (vertical for the telescope; probably 20" distant from each other) were the line introduced by

The double wires (vertical for the telescope; probably 20° distant from each other) were the line introduced by Reichenbach or Ertel. When a single line is under to hisset a very faint object, the object is extinguished. This is not the case when the object is made to hisset the space between two wires 20′ anualer, though it would be

if the wires were much closer.

The telescope is diagonal, and consequently only one-half the usual length, the eye, in observation, being always at the axis; and by this means observations can be

There are on the inner portion of the horizontal circle 10,900 lines; and on the outer portion 7,200, or also gether, 18,000 lines, as fine and distinct as on the largest astronomical instrument. This piece of work alone concepied a fortnight, working many hours daily; and it is a masterpiece of hand dividing.

M. Ertel's objects have been, the combining of the greatest possible simplicity with the greatest possible firmness.

firmness.

This form of instrument, invented by M. Ertel, has been used with great success in the measurement of the are of the meridian, by Struve.

The Jury voted to Ertel and Son, a Council Medal for this beautiful instrument, which award was sanctioned by the Group; but unfortunately did not pass the Council of Chairmen, who sanctioned the Prize Medal only.

MERS and Soss (Bavaria, No. 30, p. 1100, have exhihiet an equatoria, with the polar axis adjustable within certain limits, so as to sdapt it both as a portable instruent, and applicable to different latitudes within thosolizetylass has an aperture of 4 inches, a very sunsmall large aperture for this size of telescope, admirting a large spencil of light, and thus adapting the telescope for faint objects,

It is furnished with powers magnifying 20, 64, 96, and 216 times. It has an honr circle, and a declination

tree, both of 7 inches diameter.

The workmanship of this instrument is good, and fully sustains the justly celebrated name of the unker.

That telescope was tried twice; first, by Sir John Ihreschel, Lord Wortsteley, and Mr. (Glaisher, who reported of the object-plane as being first-rate; and secondly, after the lapse of a most, by Sr David Brus were. M. Matthiaes, appearing the most completely corrected, and this appearance was attributed by Mr. Glaisher to a disturbance of the lenses, since the first examination. At the time of the lenses, since the first examination. At the time of the lenses, since the first examination. At the time of the lenses is the proof on this surface, with their pennulum, we ex well

shown.

A Conneil Medal was awarded to Messrs. Merz for this instrument.

W. Boxn and Son (United States, No. 463, p. 1464,)
exhibit an apparatus for observing transits, by means if a
galvanic carreat. It consists of an electric bereak-circuit
clock, a galvanic battery of a single grove's cell; connecting wires; a cylinder, around which paper is wrapped,
and a spring governor, by which a uniform motion is
given to the cylinder.

The clock is like those in common use for astronomical purpose. The pallets and the exapement-wheel are insulated, both from the pendulum and from the other wheels. When the battery is in connection, the circuit is broken by the pallet leaving the tooth of the wheel, but is restored at the insulant of the beat of the clock, which is in restoring the circuit; the presence of the contract being through the pallets and the evapement-wheel alone.

Two wires pass from the clock, one direct to the battery, and the other through the break-circuit key used by the observer, and through the recording magnet, back to the battery.

The decree-magnet, with a sight difference in the form of the armature, as the mean as hat of Mouve is begraph, of the armature, as the mean as hat of Mouve is begraph, as mult reservoir. Under this pen the paper revolve, on which the records are much. The broading of the circuit by the page, and the threshold of the control of the co

The cylinder revolves in one minute; the accord marks in a continuous spiral. In observing, the observer, with the break circuit key at the instant of the transit of a star over the wire of a telescope, touches the key, and the record is instantaneously made on the paper. In the ordinary method of observation of transits, tha

signal almost instantaneous in duration can be recorded,

the momentary interruption of the circuit. The practicability of this method of recording observations is placed beyond a doubt by experience in America, and from the results there obtained, this method would appear to be more accurate than that usually adopted by the combination of the eye and car. The question yet remains to be determined, whether there be a closer connection between the nerves of the eye and the ear, or between the nerves of the eye and the finger, and this

nestion can be settled only by experiments.

The Council Medal has been awarded to Mesars. Bond.

Nostical Instruments.

Exhibitors of nantical instruments are few in number, and, with the exception of those exhibited by Entreson (United States, No. 146, pp. 1442-1446), and those by ST. JOHN (United States, No. 95, p. 1439), display but little novelty, and no decided improvements.

The sea-lead and the several other instruments exhibited by Mr. Ericason, reflect high credit upon him: they are original in their design, well adapted for their work, and useful.

Noutical Astronomical Instruments.

STRMS (No. 741, pp. 475*, 476*), exhibits a Troughton's reflecting-circle, 10 mehes in diameter, with three equidistant vernices reading to 20" of are, having an achromatic telescope with eye-pieces magnifying 8 times and 15 times, supported upon a counterpoise stand, with motions for placing the instrument in a vertical, oblique, or horizontal plane.

This instrument was invented by the late Edward Troughton, and was designed as an improvement on the reflecting-circle, previously in very general use. With it, a cross observation gives six readings upon the circle, which is perhaps as high a degree of accuracy as is attainable by any instrument held in the hand, and such an observation is obtained with much less labour than one elaiming equal confidence upon the ordinary repentingcircle. Mr. Simms also exhibits a Tronghton's sextant (p.

477*), fixed upon a counterpoise stand; this instrument was contrived for the perpose of combining strength with lightness, and consists of two thin frames of brass, united by pillars. This form was suggested to the inventor by his having observed, that with one of the large opframed sextants, a contact of the suo's limbs made with the telescope directed upwards was but apparent, a large pace occasionally intervening when the telescope was directed downwards into an artificial horizon.

This form of sextant has not only maintained its ground, but would appear by those exhibited to be fast verging on general adoption. It is usually made of 8 inches radius, and is divided to 10" of are.

A Prize Medal was recommended by the Committee upon Sextants for these instruments of Mr. Simus. BARRETT (No. 349, p. 449) exhibits several sextants, one of which is furnished with a magnifier, prepared for reading without shadow by night; the instruments are for the most part of an ordinary character, nevertheless Hon-ourable Mention was awarded to Mr. Barrett,

Carcurrox (No. 452, p. 462,) exhibits many sextants, some of a very ordinary kind; there are two, however, numbered 2251 and 2252, which are well made, but the divisions on the vernier and on the limb do not agree in any of them. In connection with drawing instruments, &c., a Prize Medal was voted to Mr. Crichton.

Mrs. Janet Taylor (No. 350, p. 449,) exhibits a sextant intended rather for show than use. Other exhibitors of sextants are Elliott and Soxs (No. 322, pp. 444-446), Watkins and Hill (No. 659, p. 438), and Dixer (No.

271, p. 466*).
MOLTENT and SIEGLER (France, No. 649, p. 1209, exhibit sextants and reflecting circles, pretty good in all

respects, the divisions excepted. The Jury awarded these

instruments Honourable Mention IMSTURMOUS TOROGRADDE MENTION.
VERY (France, 719, p. 1213,) has exhibited a reflecting
Borda's circle divided to 20', and read by means of verniers to 20''. A reflecting circle made after the improvements of Captain Riebards, by means of which very large
angles may be measured.

A sextant read by verniers to 20"; another divided to 10', and read by a vernier to 10"; a third and fourth, reading to 15"; a fifth, whose resding is to 30"; and a sixth, which reads to one minute. M. Vedy also exhibits

an artificial horizon. These instruments are well made, and a Prize Medal was awarded to M. Vedy Bunox (France, No. 443, p. 1199) has exhibited various sextants and octants in ebony and hrass, furnished with

coloured glasses to the number of five nr seven, and with both direct and inverting telescopes. The sextants are divided to 10', and subdivided by verniers to 10". The size and the construction of these instruments are in every respect like those made in England. Their divisions are good, and their price is low

Beautiful (Belginm) exhibits a sextant of 7.5 inches, The graduations are on silver to 10", sexage-imal, with every means for verification. The body of the instrument is in one piece, and is very solid; a second sextant of the same size, divided, &c., as the preceding; another sextant of 6:3 inches radius, furnished with the same accessories as the preceding, and reads to 15° sexagesimal; a fourth sextant of 4.3 inches radius, divided to 20" sexagesimal, a fifth sextant of 2.8 inches radius, divided on silver to sexagesimal minutes : a sixth sextant of chony 9.4 inches radius, divided upon ivory to 50° sexagesimal; also an octant in chony of 10.6 inches radius, divided on ivory to sexagesimal minutes, and two artificial horizons. The sextants are solid and well made, and the work of all is good.

A Prize Medal was awarded to M. Beaulieu.

ORRTLING, A. (Prussia, (1) No. 87, p. 1053,) exhibits sextants whose divisions on the limb are faint, but good: the verniers are such that it is difficult to judge of the reading to 10" in the larger, and to 16" in the smaller sex innts

IMPERIAL LIGHTH WORK (Russia, No. 169, p. 1572,) exhibits two of the largest sextants in the Exhibition, being 10 inches radius. These are sound and well made, and reflect eredit upon the artists. Asur (No. 194, p. 431) exhibits an instrument for de-

come (NV. 194, p. 301) exhibits an instrained for de-termining the course which a ship must steer to sail on a great eirele. That the instrument will do its work is more than probable; hut whether it has any advantage over the published tables for the same purpose is more than dealers. than doubtful.

Various Nontical Instruments.

Extesson (United States, No. 146, pp. 1442-1446,) has exhibited a sca-lead. This instrument, which is designed for making soundings at sea, independently of the length of the lend line, and without the necessity of rounding the vessel to the wind, is a modification of an instrument formerly constructed in conjunction with Mr. Ogden, of Liverpool. The instrument consists of two large tubes; a chamber

is placed immediately behind, and connected by means of a small bent orifice to the upper extremity of one of them, The top of the second is connected by a similar orifice to a third small tube suspended in the centre of the chamber. A stop-cock is placed at the lower end of the glass tubes for the purpose of entting off communication, if ne-

The lead being bent to the line is lowered into the sea as it sinks, the water enters the chamber, and gradually rising in it and in the tube suspended within, causes at increased pressure upon the air, which is driven through the orifices into the glass tubes. The tube which is connected with that in the chamber will be entirely filled with the air thus forced into it from the suspended tube, the water will consequently rise, and its reading may be observed upon the graduated scale with which the instru-ment is furnished for that purpose.

The contents of the chamber being much greater than

^{*} For a full description of this instrument, see "Pearson's Astronomy," and "Encyclopadia Metropolitans," vol. L,

that of the tabe suspended within it, the air with which it is filled will not be compressed sufficiently to admit water into the glass tube connected with it outli the lead shall have descended to a depth of 25 fathoms. The tube is therefore well adapted for the measurement of deep soundings, which the other expisives small depths, which we have the contract of the contract of the contract of use is attended with less loss of time than the casting of the ordinary deeperse lead.

Mr. Ericason has exhibited an instrument for measuring distances at sea. This instrument is intended chiefly for the use of naval officers, to enable them to determine, by neans of a single observation taken at sight, the distance of a vessel, either advancing to or receding from the observer.

If the eye be placed at a certain beight above the level of the sea (say on the main-top of a ship), the vertical angle, formed by a line passing from the eye to any fixed point in the borton, and a line from the eye to the water point in the borton, and a line from the eye to the water greater as the vessel received from, the question; to make the vessel received from, the question; to measure this angle and to determine the distance of the ship, is the being length of the line framework of the being purposed of the being purpose of this illustrations, which is composed of the

Keller (France, No. 280, p. 1190) exhibits a double planisphere, designed to assist navigators in great-circle sailing. It consists of two concentric circles, the one fixed and transparent, the other movemble.

ST. JOHN (United States, No. 95, p. 1439) has exhibited a very ingenious self-detector compass. In appearance it is very similar to the ordinary box-compass, and differs ebiefly in the following particulars: -- upon the compass card, and attached to it by pius, are two small needles. called satellites; to the centre of each a brass indicator is fixed; on the face of the eard are engraved two semi circular scales, or area of circles, so placed that their centres are in the centre of the compass card, and in a line joining the centres of the satellites: both these scales are graduated to degrees, the numbering of the graduation proceeding on either side from the central point of each scale. The satellites are balanced upon pins, move freely, and thus permit the brass indicators to move easily over the graduated area, according to the amount of disturbance, The satellites and the main needle being equally magnetized, remain stationary when there is no cause of disturbance in the magnetic meridian, and the brass indicators point to their respective centres; but, should there be any cause of disturbance, the indicators move simultaneously in opposite directions, thus indicating its amount, and if the urse of the disturbance be local, the indicator attached to that needle, the nearest to the seat of disturbance, will pass through the greater angle, and thus the direction of

the distributing cause is abown.

Mr. St. John has also exhibited an aquatic velocimeter.

This instrument in designed to abow upon a flais-face the
velocity. Upon the dall are three circles, each provided
with an index, and so graduated that the first performs
one revolation in a mily, the second in 160 miles, and the

revolving shaft, which receives its motion from a paddlewhich attacked to it. The water acting upon its fan causes it to turn round, the shaft in connexion with it performing one revolution in a distance of 4 feet. The performing one revolution is a distance of 4 feet. The obviate any danger which might strine from the position of the pipe within the vessel; there are also facilities for disconnecting the apparents from the clock-work, for the purpose of actual place lines to any time to point desired, purpose of actual place lines to any time to both St. John for those leventions, and warm the Prize Medal to John for those leventions, and warm the Prize Medal to

Surveying Instruments.

The instruments exhibited in the British persion of this sections are few in number, and, with the exception of those by Simms, Dollond, Marratt, and Yurte, are, for the most part, of an ordinary haid, there being suited may be found beautiful the properties of the properties of the properties of the colorisation of the colorisation with the properties of the colorisation with the properties of the colorisation of the colo

detailed presently.

The Polytechnio Institute of Vienna has exhibited various instruments for levelling, which present many improvements, the result of more than an ordinary degree of attention. Mr. Burt, of America, has exhibited a compass well adapted for surveying.

Surveying and Levelling Instruments.

Sixuas (No. 741), r. 479 (whithis a framit the colonic. That his of instantor was instructed as few years aime produced for the product of th

estimation the angle can be read to less than 5".

The telescope is 13 inches in focal length, and 1½ inch aperture, and is furnished with magnifying powers of about 25 and 40 times. The magnetic needle, spirit level, lamps, and tangent screws, and other fittings, do not differ materially from those usually adapted to theodolites of the best construction.

DOLLOVA (No. 148, pp. 426—428). A transit the cololite. The circles are 12 inches in diameter, each reading by verniers to every 10" of arc. The telescope fixed to the altitude circle is 30 inches foul length, and 16 inches and its apported on Y₁ on two strong concernating or and its supported on Y₁ on two strong concernating on the azimath circle. The compass is 5 inches in fine and divided to every degree. The apider lines are illumiant divided to every degree. The apider lines are illuminated to the control of the control of the article of the control of the control of the circle.

YEATES (No. 332, p. 446) exhibits a very portable small theodolite, with good divisions, well made, and strongly put together. It is furnished with one large spirit level. Also a 4-isot heodolite, dishpiving good workmanship; a prismatic compass with a spirit level attached, and an optie square, incended for use in determining distances. All these instruments are well made, and deserving of Honourable Mention.

Manarty (No. 409, p. 554) exhibits a 7-inch theodolite, which reads to 15". It is furnished with a locking-plate and tripod. The lower portion consists of a massive tripod with foot-screws, to which is fixed the eestre on which the instrument recolvers. The lower limb is in one piece, and is furnished with tongent-screws and three verniers. The exterior centre and Ys for the support of

transit axis are cast in one piece, and to which is attached a spirit level. The telescope is soldered to the axis, and the vertical circle is firmly screwed to it, so that the vertical circle, axis, and telescope, are firmly connected. The whole instrument is formed of the smallest number of pieces, with the view of preventing flexore and insuring stability. The Jury awarded Honourable Mention, JOSEPH (Canada, No. 182, p. 968) exhibits a 6-inch

thresholite of very indifferent workmanship. ELESOTT and Suns (No. 820, p. 444) exhibit an altitude and azimnth instrument of the ordinary construction. is understood that this instrument is intended chiefly for surveying purposes; it is coarsely divided, They also surveying purposes; it is coarsely divised. They also exhibit two transit theodolites, the one of 5 inches and the other 6 inches diameter. These instruments were not adjusted. Mesers. Elliott and Sons also exhibit dumpylevels of good workmanship. In those exhibited, the levels of good workmanning. In those exhibited, the index-bar on which the level rests is placed vertically, instead of horizontally, as they were in those by Mr. Garratt, the invector of this kind of fevel. There is also a change in the mode of adjusting the bubble; instead of the use of three serves at either ead of the bubble, there is one strong joint at one end, and a screw at the other; the joint cannot move till the screw at the other end is loose, and it is so constructed that it is almost impossible to become loose by travelling; and they exhibit an instru-ment based upon the principle of similar triangles, adapted for the determination of distances

BRIDGES (No. 339, p. 448) exhibits an instrument to determine the distances of objects, either by night or by day, and rules are given to determine the distance when the height is known, or when its breadth is known, or when neither is known, and also to determine the same by night. Banton (No. 708, p. 473*) has exhibited an instrument designed for sketching ground, for military purposes, with great rapidity. It is designed with a view to its being manageable in the bands of men engaged in military service, without regard to their scientific acquirements. Its simplicity of construction renders it very inexpensive.

For description of this instrument, see lilustrated Cats-Honourable Mention is given to this exhibitor. LINDELL (No. 362, p. 450) has exhibited pocket-sight and field-sight spirit-levels to the number of 30, as used mechanics, and adapted for drainage, road surveying, &c

The spirit-levels are exhibited on account of lowness of ica; some of the sight-levels are furnished with reverse sights; there is one level with a revolving shade, intended as a safeguard in the level tube.

ADCOCK (No. 353, p. 449) has exhibited a machine for drawing and mapping roads. GREEN (No. 446, p. 462) has exhibited a miner's com-

level, with adjusting parallel plutes on triped stand. It is a simple and inexpensive instrument, giving, by inspection, the rise and fall of land intended to be drained. It is also useful in laying tites, levelling, and in building operations. Mr. Cox has also exhibited an A level, to be used without either parallel plates or tripod stand.

BLYTH (No. 367, p. 450) exhibits four levels, of different lengths, with stand and small telescope Donns (No. 346, p. 449) exhibits a spirit-level, applicable for levelling machinery.

Honne, Thornthwaite, and Woon (No. 220, pp. 434, 435) exhibit an augular spirit-level, showing the rise and fall in inches and parts. It is adapted for agricultural

DENTON (No. 317, p. 443) exhibits a workman's drain-ing A level, with a boh, intended for the use of farm labourers; and a second level of the same construction furnished with a spirit-level.

Willron (No. 402, p. 453) exhibits a miner's theodolite.
Braon (France, No. 443, p. 1199) exhibits a repeating
theodolite with concentric circles, 8-7 inch diameter, divided to 10", and read by four verniers to 10". It is firmished with two telescopes of 17-7 inches in length, and apertures 1-2 ioch. The vertical circle is 4-3 inches In diameter, and is divided to 30". Mr. Haron also exhibits several levelling instruments. BEAULIER (Belgium) exhibits a repeating theodolite, of

the form used by Gambey. Its circle is 13 inches in diameter, divided on silver to 10 centesimal minutes, read by means of four verniers to 10 seconds, and is adapted to take either horizontal or vertical angles-

The azimuthal circle is 8.7 inches in diameter. It is divided upon silver, and is read by a single vernier. It is furnished with two levels. The telescope is 1 8 inch aperture, and 19°3 inches focal length. There is a counter-poise attached, to be used when vertical angles are to be This instrument was constructed for the Depot de la Guerre, in Belgium, for which service all the instruments are divided upon the centesimal system, but M. Beaulien has likewise divided this instrument sexagesimally, the principal circle reading to 4 seconds of are, and the azimuthal circle to 20 seconds. All the divisions of this instrument are very good, as indeed is the workman ship of the whole instrument, and the sextants exhibited (see Section, Nautical Instruments); a Prize Medal was voted to M. Beaulien.

GROETAERS (Belgium, No. 156, p. 1156) exhibits an instrument for determining the distance of insecessible objects. It is stated that the results obtained by the use of this instrument have been good.

DE HENNAULT (Belgium, No. 183, p. 1157) exhibits a miner's compass, intended for use in determining the co-

ordinates of a mine. LAMBERT (Belgium, No. 185, p. 1157) exhibits a small miner's compass, but not so well made as the preceding.

Backen (Netherlands, No. 83, p. 1147) exhibits a level-

ling apparatus.

BREITHAUPT (Prussia, No. 670, p. 1087) exhibits a theodolite. In this instrument, as in most theodolites of German make, the circle which carries the verniers is let into, and surrounded by, the gradented circle, so that their upper surface, on which the graduations are traced, are in one plane. In order to protect the divisions from dirt, rain, and from mechanical injury, the vernier circle carries a thin circular plate of hrass, which completely covers the graduated or outer circle, with the exception of two openings, covered with plate glass, through which the verniers can be seen.

This useful covering for the graduations, though now used by other artists, was, we believe, first introduced by Mr. Breithaupt,

Mr. Breitbanpt also exhibits a level, which instead of having circular collars on the telescope, which it is diffienit to make of equal diameter, and, if accurate when the instrument is new, are very apt to bear unequally, has towards each end of the telescope a knife-edge, and opposite to it, on the other side of the tube, a steel series with a convex head; one knife-edge is on the upper side of the tube and one on the lower side. The level is attached to a plate of steel, having its under surface ground truly Cox (No. 347, p. 449) has exhibited a beam draining plane. By turning the convex-headed servers, the planes through the knife-edges, and touching the heads of the serves, can be made parallel to a line joining the centre of the object-glass and the intersection of the cross wires, and therefore to each other. The ling of columntin of the telescope will be truly horizontal when the bubble of the level maintains the same position before and after inversion. This contrivance greatly increases the facility of adjusting a level, and of rendering the person using it independent of the skill of the maker.

It is a common error among surveyors to assume that the circular collars of a level are of equal diameter; and as long as this belief prevails, this invention must be of peculiar importance,

Mr. Breithaupt also exhibits a mining theodolite. This instrument is attached to its triped by a slightly conical socket, and the graduated circle is made horizontal by two screws, poposed by two strong springs. The graduation of the horizontal circle is to 30° and has two verniers. Its diameter is nearly 4) inches. The vertical circle, which is about the same diameter, is also read to 30° by two verniers

The telescope, whose sperture is about 11 lines at the place where it meets the horizontal axis, has a rightangled prism, which reflects the rays coming from the object-glass. At one extremity of the long borizontal axis are placed cross wires, adjustable by rack and pinion, and an syc-piece, adjustable by servering, similar to those of the levels. The telecoope can be pointed to any object, from the result in a depression of but more below the which is moved by a micromoter serve; and thus distance, can be measured from our station, by observing the stance, can be measured from our station, by observing the stance, can be measured from our station, by observing the stance, can be measured from our station, by observing the stance, and be measured from our station, by observing the stance, and be standard that the standard of the standard

protractor, the divisions of which are good, KYZELBACH (BAUTA), No. 50, p. 1113) has exhibited a surveying cross, being a cone of bruss, with two pairs of flue slits, for sights, at right angles to each other, running obliquely up its sides, and revolving on a base, the circumarerance of which being graduated, is read off with a versirer, tha whole being screwed on the top of the sur-

veyor's rol.

Mr. Kinerbeoch has also exhibited a diastimeter, or distance-measuring instrument; being a telescope, provided with a microsorter and divided cucks, the microsorter and divided cucks, the microsorter being mounted with two parallel wires, moverable simulations and the control of the field of view, and thus to embence the area of greatest distinctions and cases. Also an improved Weldstood's goodneeter.

IMPERIAL POLYTECHNIC INSTITUTE OF VIENNA (Austria, No. 130, p. 1014) has exhibited several beautiful instruments, constructed according to the plan suggested by

Professor Stampfer.

A large level. The aperture of the object-glass is 18 lines, and the power 20. The support of these levels consists of three feet, attached to the sides of a triangular prism by strong screws. The upper part of the prism is a truncated cone, fitting into a slightly conical socket, which forms the lowest part of the brass-work of the level. This socket is clamped very firmly on the stand by a single turn of a screw, so that the level can be readily attached to, or removed from, its tripod. The lower part of the level consists of two circular plates, connected by a ball and socket, as in the levels constructed in this country. But instead of four screws for making the upper plate horizontal, the Austrian level has two screws and two strong springs, the screw being at one end, and the springs at the other end of each of two diameters of the plates, as right angles to each other. By this contrivance the upper circle is more quickly and easily made horizontal than in many other known instruments of this kind, without the danger of either shaking or bending the plates, attendant upon the use of four screws,

The upper circle, which is about 44 inches diameter, is graduated, and has two versiers, reading to 30' The greatest improvement introduced into this level is n micrometer serew, by which an angle in a vertical plane, if ant more than 8, can be determined to within 1" or 2" of the truth. This serew is of great use in making the telescope very accurately level, when the instrument is employed in the ordinary manner, and the situation of the levelling staves so chosen that they are intersected, at some point of their length, by a horizontal plane through the axis of the telescope. By the aid of the micrometric screw, however, the difference to the altitude of two stations can be determined, when it greatly exceeds the length of the levelling staff. For this purpose the staff carries two marks, at a known invariable distance from each other. The angular altitudes or depressions of these two marks, measured by the micrometer screw, serve to determine, with great precision, not only the inner eleva-tions or depressions of either mark above or below the axis of the telescope, but also its horizontal distance from the centre of the instrument. These distances, combined with the difference of azimoth of the stations observed with the horizontal circle, afford data for constructing a map of the country passed over in levelling. The selection of stations in this mode of levelling is limited only by the condition that the elevations or depressions of the marks shall not exceed 8? By one observation, differences of level of 100 feet between two stations may be measured;

* See the 20th volume of the Polytechnic Institute.

hos the stations may be taken at much greater distances, from each other than in levelling by the old method. This advantage is porticularly fet in levelling through a first part of the stationary of the statio

able by a rack and pilent. This tube moves between three bearings, attached to the inside of the onner tube, at equal distances from each other; one of those is a spring of the tube carrying the milenometer. The telescept is adapted to the focal length of the eye of the observer, by having that lens of the eye-piece which is earcit the role in a complete the contract of the contract of the contract in the contract of the eye-piece of intense, to gire distinct on the contract of the eye-piece of intense, to gire distinct vision of the even wires.

 Smaller levels, of similar construction, in nne of which the telescope has a power of 15. In another the power equals 12. A fourth is similarly constructed, with the exception that it has no horizontal graduated circle;

tha power equals 6.

 Twn pocket telescopie levels.
 A raker for plane table surveying, with a telescope provided with a micrometer screw, similar to that of the large levels for measuring distances.

 A rater for plane table surveying, with telescopic sight. The Jury awarded Honoumble Mention for these instruments.

minorum (Pressis, No. 484, p. 1078) exhibits a 6-inch headshite, of regregod verkmushly. The Jury awarded Hossumale Menton in Mr. Schröder.

Juryezak, Lonox Wonse, (Rossis, No. 169, p. 1372)
exhibit a levelling instrument, mounted on a well-bruced and very firm tripod stand. The instrument is well made in every part, with good divisions, and reflects credit upon the artist.

Bowr (United States, No. 187, p. 1449) has exhibited an "astronomical compuss," an instrument intended for the survey of lands, buys, &c., for the determination of latitudes, apparent time, and the magnetic declination. It contains of two plates of about of inches in diameter: the apper revolves about the lower by means of a centre-

piece, which, when fixed, leaves the under plate to revolve freely. That we plates can be clamped together by means of two clamps. The upper side of the lower plate is divided, the graduations being seen through two openings in the upper plate, and which are furnished with verniers. A small magnet is placed on the upper plate for deter-mining the declimation. To the upper plate is fixed a grooved arc, a latitude are, a declimation arc, an hour arc, two spirit-levels, &c. The latitude arc is fitted to one end of a curved bar, the other end of which is in connection with the hour are, and can be adjusted to the latitude of the place. The declination are is placed upon a limb which revolves equatorially upon a centre, and there is a second moveable limb turning on a pivot at one end, and fornished with a vernier at the other, which moves on the declination are and affords a means of clamping it to the sun's declination. To each end of a moveable bruss limb a small brass plate is attached at right angles; into the upper side of one, and to the lower side of the other, a small convex lens is inserted, fitted with a sliding shade, through which there is a small hole; opposite to each lens is fixed a small silver plate; on these plates fine lines are drawn, sufficiently separated to include the image of the sun. The area of latitude and declination have each a radios of 5 inches, and are graduated to 15', and read by verniers to single minutes. The hour circle has a radius of 2\frac{1}{2} inches, and is divided to half degrees. The instrument is firmished with every means of adjustment and verification. It is well adapted for surveys in new districts, and has rendered good service in magnetic districts, where it is understood that instruments constructed with magnetic compass have failed. The Jury voted a Prize Medal to Mr. Burt.

Standard Measures of Length.
Whitwonth and Co. (Class VI., No. 201, p. 290) have exhibited a standard bar measurer. This machine consists of a metal frame, at each end of which is placed a micro-

meter; that to the right-hand is a combination of a screw about ten threads to the inch, of a tangent screw and wheel with 400 teeth, and also a circle with 250 divisions. Therefore the divisions on the circle indicate 4th of 4th of that of an inch, or of one millionth part of an inch. The micrometer placed at the left-hand is furnished with a screw with teu threads to one inch, and a circle divided iuto 500 paris, and thus one part of the eirele corresponds to shoth part of an inch. On the upper side of the frame, and extending through its whole length, is placed a half square groove made of steel, with its angle downwards, and its upper edges horizontal. In this she measure is placed. Between one end of the measure and the point of the right-hand micrometer, a perfectly flat contact piece of metal is placed, with its sides parallel; the other end of the measure abuts against the left-hand micrometer.

There are two methods of determining when contact

takes place, and hence the length of the standard measure.

1. By that which is termed the test of gravitation, 2. By that which is termed the galvanic test,

(1.) The test by gravitation is as follows: The experimenter moves the end of the screw of the right-hand micrometer through one millionth of an inch by means of the right-hand micrometer; then carefully raises the contact piece, and allows it to fall by its owo gravity: he then moves a screw through a second millionth of an inch, raises the contact piece as before, and so on, till the approach of the end of the micrometer screw to the end of the measure prevents the contact piece from

descending. This completes the measure. 2.) The galvanie test is as follows:-

There is a small battery composed of a piece of zine and copper soldered together and immersed in rain water, without the admixture of any acid: this is connected with the micrometer (which is insulated from the machine) and with a delicate galranometer by means of covered wires. The measure itself is also insulated from the

machine. By parsuing the same process as before, contact is indi-

on completing the circuit hy the deflection of the

needle of the galvanometer.

This beautiful and delicate apparatus seems to be capable of improvement: the ends of the measure exhibited are perfectly flat, and of its full size; the contact pieces are somewhat smaller, but the constant and repeated contact must wear the ends away, and soon alter its length. For a standard bar, it would certainly be better to insert at its ends a smaller contact surface, of a substance much harder than steel. A Council Medal was awarded to Messrs, Whitworth. (Awarded also in Class VI.)

BAUMANN (Prussin, No. 76, p. 1052,) exhibits Bessel'a standard measure. It consists of a solid beam of mahogany 4 feet 64 inches in length (Prussian measure), 7 inches 2 lines square. The two 3-feet bars to be com-pared are placed upon a carriage on five wheels, which run on rails in a direction at right angles to the length of the bars. At each end of the carriage are receptacles for the bars with screw adjustments for placing them in a proper position for comparison. At each end of the beam is placed a micrometer, consisting of a slider moved by a screw having about 400 turns to the iuch. On the slider are two Ys, in which rests a cylinder of steel about 7 lines in diameter, and 4) inches long. The inner end (viz., the end directed towards the middle of the beam) is ground convex, the other end is a cone. The point of the cone rests against a vertical plane of steel attached to the axis of a "fühlmivenn" (level contact) at a point about 0.25 inches from the axis. The bars to be compared (bars of steel, not hardened, 0.75 inches square, having their ends on rather a small circular disc at either end, which is made of hardened steel, ground truly plane), are placed on the carriage, with their axis about 11 inches as under. The carriage is moved till the axis of one of the bars coincides with the ends of the steel cylinders, and the micrometer screws are turned till the convex end of the steel cylinders coming in contact with the end of the bar, the pointed end of each cylinder pressing against the steel plate attached to the axis of the level turns the sevel, till the hubble rests nearly in the middle. The divisions of

the head of the micrometer screws, and the divisions of the level scales at which the end of the bubbles rest, are then read off. The slides are now withdrawn through a small space, the carriage moved till the axes of the second har coincides with the axes of the steel cylinders, and the bar councides with the axes of the steel cylinders, and the micrometer serves turned as before, till the courve ends of the cylinders come in contact with the ends of the second bar, the conical points turn the level till the habites rest nearly in the middle of the scale, the divisions of the heads of the micrometer servers and divisions at which the ends of the bubbles of level rest are read off. This constitutes one comparison.

After a certain number of comparisons have been made this manner, each bar is turned, so that the surface which was undermost becomes appermost, without turning either of them end for end, and the same number of comparisons made as in their original position. The object of this is to estimate any error that might arise in making the ends of the bars coincide with the axes of the two steel cylinders, supposing the plane end of the burs not to be exactly at right angles to the axes. During the comparisons the bars are covered by a wooden case, which allows the heads of the micrometer screws and tubes of the levels to be seen, and has two openings, covered with glass for observing the thermometers placed on the bars to be compared.

The delicacy of this "comparateur" is such that unless extraordinary precautions be taken, the errors produced by the fluctuations of atmospheric temperature are much cater than the errors of measurement.

In order to eliminate error, arising from the heat radiating from the observer, Bessel recommends calling the bars A and B; A should be brought between the micrometers, then B, B again, and then A. These four measures he calls one comparison. The observer then should station himself on the other side of the com-parateur, and make a second comparison. Bessel made a number of comparisons of two bars in a cellar, where the change of temperature was very small.

The means of four comparisons, two before and two after, the bars were turned, differed from the mean of ourteen sets of 1 inch from comparisons by the following fractions of a line :-

> - 0:00010 - 0.00001 + 0.00013 - 0.00001 + 0:00010 + 0.00003 - 0:00002 - 0:00011 - 0'00018 + 0.00011 + 0.00005 + 0.0000

To make the axes of the bars coincident with the common axis of the steel cylinders a ring carrying a fühlhebel (lever of contact) can be fastened on the end of either cylinder. Bring the fühlhebel in contact with that portion of the end of the har which is cylindrical, and tarn the cylinders round its axis. If the long arm of the fühlhebel remains pointing to the same division of the are, along which it moves, the end of the bar is strictly centred, if not the long end of the lever will move on the graduated arc. A Prize Medal was awarded to Mr.

0.00000

Sthms (No. 741, pp. 475-477,) exhibits the three standard yards, prepared for Her blajesty's Commis-sioners, for the restoration of the standard of length, with two methods of supporting them; one hy Professor Miller, consisting of a system of levers, hy which an equal degree of pressure is sustained upon eight equidistant points of the bar; the second by the Rev. R. Sheepshanks, by floating the bar in mercury, which is therefore equally

* For a complete description of this instrument, see Bessel's "Darstellung der Untersuchungen and Masss-regelin, &c.," Berlin, 1839. supported at every point throughout its length; the bar is covered with a coating of gold-beater's skin to defend it from attack by the mercury. It is probable that the former is the better method, as the latter, though good in theory, is probably not good in practice, from the fact that iron rusts easily in mercury, and copper and its alloys combine easily with it.

commine carry with it.

Mr. Simus also exhibits two standard scales, which
have been used for the formation of many scales now in
use. They were made by the exhibitor, whose property
they are. The tubular scale is No. 3 of Mr. Bailey's Report on Standard Mensures.*

Dividing Machines.

ACKLAND (No. 368, p. 450) has exhibited a machine for dividing hydrometers and other variable scales, with accuracy. The instrument is furnished with a mounted head, screw, and suitable entting apparatus.

The usual means of graduating hygrometers is hy determining three points by means of three different fluids, whose specific gravities are known, and dividing the intervals between these points into equal parts. This method is evidently defective, as the divisions, instead of being equal, increase, in a given ratio from below

upwards.

The plan adopted by Mr. Ackland may be divided into three processes:-1st. The ascertaining the exact position of three or more points of the scale, according as the stem of the hy-

drometer is more or less cylindrical.

aromere is more or ress crimaries.

2ndly. The dividing with great accuracy a scale on box-wood, to show the specific gravities required to be indicated by the hydrometer, and to be used by the instrument for the purpose of measuring and correctly marking the distance of one division from another on the paper scale with true mathematical certainty rdly. The making a reduced copy of the box-wood

scale, so as to form a scale, the points of which shall cor-respond with the distance between the ascertained points of the hydrometer halb. The scale so formed on paper is the scale for the hydrometer. For example, suppose it be required for a hydrometer to show specific gravities from 1 000 to 0 700; to show this a bulb is chosen with a stem as uniform as possible, and three points, viz., '700, '850, and 1'000, are ascertained as follows:-

Let a b e be the degrees required. Suppose m be the point on the stem whereon it is required to mark the highest specific gravity, vis., 1.000 = a. To find this point, the instrument is louded until it floats in distilled water at the temperature 62° Fahr., at the point m; let the weight of the instrument then be x. Tu find '850 = 6.

Load the instrument until it weighs $\frac{a \cdot x}{L}$, where it floats in distilled water, mark the tube at a. To find '700 = c

Load the instrument until it weighs $\frac{a \cdot x}{x}$, where it floats in distilled water, mark the tabe o.

Finally, before sealing the instrument, make it weigh a x; then m n o will respectively represent the specific gravities required. By this plan, which was suggested to Mr. Ackland by Dr. Clark, of Aberdeeu, the correct position on the stem of the three specific gravities is obtained; the next and most important operation is the subdivision of these spaces, so that each division shall be in its true position. This is done by copying a calculated scale by aid of the machine, the construction of which is such that a proportionate scale of any length less than the

iginal can very readily be produced.

The scale is determined by forming a table of the reciprocal of the specific gravities, and taking the differences between them; in use the micrometer head is snecostively advanced, and each division is ent with accuracy and with great rapidity.

Most of the scales of the hydrometers exhibited have

+ See tha "Transactions of the Royal Astronomical Society.

been graduated in the usual way, and are therefore in-necurate; these exhibited by Griffin (No. 457), were performed by this machine, which Mr. Ackland has the merit of inventing. He is the first in England who has carried

into active practice a correct mode of subdividing glass vessels for gases and liquids by the aid of a machine. The cutter is made to cut, and cuts a division. The detent, apparently, is then brought back to the common coutre of the helix screw, either by lifting, unclamping, and re-clamping, or in some equivalent way, and rura its course again to bring the cutter ready for another cut, and so on. There is also a second novelty, vir., a nest little contrivance to make every fifth division longer than the rest by means of a wheel which advances one step at each division or movement of the cutter frame. A point, let drop to touch its circumference, determines, by the depth to which it descends, the length of the ent; but at every fifth step the wheel has a notch into which the point descends, allowing the enter to make a longer stroke—

longer by the depth of the notch.

A Prize Medal was awarded to Mr. Ackland.

PERSEAUX (France, No. 369) has exhibited a straight se divider. This is a beautifully-courived divider line divider. on Ramsden's principle, with a long fine steel serew. The novelties are, first, the wheel at the screw head, which is divided into 400 parts, and has cut upon its circumference (which is made broad), a belix screw, in the thread of which runs a detent carried along by the run of the thread till it meets a stop clamped on the helix at a definite point. This arrests the serew, at this point of the motion. A Prize Medal was awarded to M. Perresux.

FROMENT (France, No. 1609, p. 1254,) exhibits a divided metre, the divisinos on which are beantifully distinet, and as far as could be ascertained, very exact. It is believed that the divisions were cut by M. Fromen's dividing engine, which be has constructed for dividing astronomical and geodetical instruments. M. Fromen's has also constructed a screw more than a metre in length, for the purpose of dividing lines quickly, and it is nader-stood that in so doing electricity is made use of in con-nection with the movements of the acrew and machine.

A Council Medal was awarded to M. Froment. The Consumpatorak des Arts et Métiers (France, No. 1568, pp. 1251, 1252,) exhibits a hrass metre by Gambey, decimally divided. Also a fine platina metre, which is described as the "second type of the Collection of Weights and Measures of the Conservatoire des Arts et Métiers,- executed by M. Brunnen, and compared by M. Silbermann," and is stated to be a copy of the ancient

plating metre of the same collection, an immediate derivative of the prototype in the archives of France, and to be 0.000019 millemetre

Tis properly speaking a "metre à bouts," and is converted into one "k traits" by attaching to each of its extremities a supplementary piece of patina, separated from the bar by a very this lamins of gold, which appears as a fine line of gold at the junction. It is supported on a bed of bronze, to which it is attached firmly and by accurate adjustment at one end, whilst the other is left free to slide by expansion, thus converting the whole system into a Borda's pyrometer, the amount of relative expansion being rend upon a scale, the value of whose points has been derived from experiment by immersion in melting ice and boiling water. The Conservatoire des Arts et Métiers also exhibits a

standard kilogramme and litre; a series of French coins of legal currency, and a collection of wood meanring rods, both in single lengths, and in more or less numerous joints; also measuring chains, and a series of measures of capacity of the following values (in litres), viz.:—

20, 10, 2, 1, 4, 3, 4, 4, 4, 4, 1, 1, 1, in brass, with ground rims and sliding glasses to each

Bulances.

The Exhibition contains balances of all sizes, from Mr. Fox's balance, intended to carry extremely small weights, up to the balances of L. Certling and the American balance, both of which are capable of carrying

56 lbs. in each pan. Many of them have probably never been surpassed, in the construction of the beam, knifeeages, phones opposed to them, permanence of the adjustments and beauty of workmanship; yet in all, the position of the beam, when loaded with the weights to be compared, is shown by a long index nearly in contact with a graduated are, although for several years other and greatly superior methods of determining the position of the beam have been in use, such as hy a graduated are attached to one end of the beam, and viewed through a compound microscope baving a horizontal wire in the fecus of the eye-glass, or by a mirror attached to the beam, in which the reflected image of a scale is viewed through a telescope.

In the balances exhibited the beam and pans are suspended on knife-edges, more or less in length, with the single exception of Mr. Fox's balance, in which the beam has pivots, the conical ends of which play in hollow again

coues of larger angle.

There is no example of the balances constructed ander the direction of Gauss and Weber, and described in the "Gottingen Transactions," in which the beam is suspended by two watch-springs, and each pan by a single watch-spring; nor of either of Steinheil's balances, in which the beam and pans are suspended by wires or silk ribbons; nor of the balances first (Professor Miller believes) invented by Steinheil and used by Kupffer in comparing the Russian standard of weights, in which the beam carries two small steel spheres in the middle, resting upon a steel plane, and a sphere at either end, upon which rest the plane or slightly concave spherical surfaces of the plates from which the scale-pans are suspended. There are a variety of contrivances for ebecking the

oscillation of the beam and pans when in action; none of them can compare in simplicity and efficiency with the apparatus invented by Wollaston, and used by the late T. C. Robinson, Barrow, Dover, and by most of the English makers of balances, and also by Nissen, of Convenhagen, the only foreign maker who appears to have made

In nearly, perhaps in every instance, when the divisions of the scale, to which the Index of the balance points, were numbered; the division to which the index points when the beam is horizontal is marked zero, and the scale numbered 1, 2, 3, &c., to the right and left. This method is most inconvenient, and frequently leads to error. The number of the divisions ought to run all the same way, and need not begin with zero, it being far better to number that division to which the index points, when the beam is horizontal, 10, 20, or some multiple of 10, for the purpose of avoiding the trouble, perplexity, and liability to error, attendant upon the necessity of noting numbers, in addition to whether the numbers are positive or negative. This remark is of general application to all instruments to which scales are offixed.

L. Orartana (Nn. 334, p. 446) exhibits a large halonce having n beam 3 feet in leagth, coated with platinua; and capable of corrying 56 lbs. (conal to 254 kilo-grammes) in each pan. The beam, a pierced rhomb, is constructed so as to give great strength in proportion to its weight. Any tendency to Interal yielding is counteracted by easting the beam with edge bern

The whole length of the middle knife-edge rests upon a place surface of steel; the three knife-edges are long.

Plane surfaces of steel, from which the scale-pans are suspended, reat upon the extreme knife-edges. When not in action the beam and the steel planes from which the scalepaus lang, are supported, so as not to be in contact with each other. The frame for supporting the beam nod paus is extremely well contrived; so also is the mechanism for lifting it.

He exhibits also a balance capable of carrying one kilosome in each pan. The heart of this balance, which is 16 inches long, is coated with palladium;† the three

* See Kupffer's work on the "Comparison of Standards" for a description of this balance.

† These beams were conted by T. H. Henry, Esq., F.R.S., by n peculiar process, in which the electric current was employed in depositing these metals. It would seem, from

knife-edges, as well as the plane upon which the middle knife-edge rests, and the planes from which the pans are suspended, are of agate, so that the whole instrument is nunflected by acid vapours. The beam is graduated, and small differences of weight are determined by a small weight that can be placed upon parts of the graduated beam. The beam and pans are supported, excepting when in action. The adjustments of the knife-edges, in the direction of the length of the beam, are as few as possible to be very permaneut. The koife-edges are not capable of any adjustment after leaving the artist's hands in a direction perpendicular to the length of the beam. As far as the beam and knife-edges are enaceracd, a better balance has probably never been constructed. He exhibits also a smaller balance: the beam is 14 inches long, similar to the former in construction, and capable of carrying about 1,000 grains. A Conneil Nedal was awarded to Mr. Oertling.

Doven (No. 344, p. 449) exhibits a balance, which in construction is similar to the balances constructed by the late T. C. Robinson, and, in execution, fully equal to the balances made by that most excellent artist, is 104 inches long, and is capable of carrying about 2,000 graumes in each pan.* The three knife-edges are of steel, the planes opposed to them being made of agate. The final adjustments, both in the direction of the length of the beam and in a direction perpendicular to it, are effected by a cut at each end of the beam making an angle of about 45 with the axis of the beam, which may be widened by means of a screw. This is an excellent mode of adjustment, succeeding perfectly, and proved to be very permanent when confined to extremely narrow limits. If these limits be exceeded, as they sometimes are in maskilful hands, the end of the beam is cracked and

Mr. Dover has substituted chains with long links for silk threads, for suspending the pans, and has added an incruious contrivance for susporting glass tubes in weighing.

weighing.

A Prize Medal was awarded to Mr. Dover.
Fox (No. 377, p. 451) exhibits a balance for extremely small weights, which has instead of a knife-odge at the middle, an axic ending in conical points, which points play in conical holes (the angle of the cone in the holes is, of course, greater than the nugle of the cone of the pivots). The attraction of a magnet brings the beam exactly to zero before weighing. In order to overcome the friction, of which much is introduced by the construction of the balance, there is an instrument for rasping

MARRIOTT (No. 341, p. 449) exhibits a chemical balance, the beam of which is made of a wide bit of wood (fir), with interstices cut out so as to leave a strongly framed network. The knife-edges do not appear to admit of any adjustment. The scale-pans are suspended from double hooks of wire hanging on the end of the knife-edges, This instrument is a curiosity: it is stated by the maker to be sensible to the 100th of a grain. It is a good example of a make-shift for a halance, when at a distance from good workmen.

DE GRAVE, SHORT, and FANNER (No. 333, p. 446,) exhibit two assay-balances, apparently of very good work-manship, but not adjusted, and a large oumber of com-mercial balances of various kinds, weights, and measures of capacity and length.

Bache | United States, No. 395a, p. 1462).-Large balance, capable of carrying 56 lbs. (equal to 25'4 kilo-grammes) in each pan. The kuife-edges are square bars of steel. Each har is fitted into a socket attached to the beam, having a rectangular notch, so that any me of the four edges of the bar may be used as a knife-edge. The

this successful application, that the same process is applicable to graduated instruments.

* A similar balance, finished by Mr. Dover, was used repeatedly by Professor Miller to weigh 5,760 grains, and

represents by Processor States to weigh 3,750 grains, and was not in the slightest degree injured.

† The centre of gravity is too high to admit of using I in the event of one of the edges being damaged this arrangement is of great service.

socket, in which one of the extreme knife-edges is fixed, moves in a slit in the direction of the length of the beam, and is adjusted in that direction by means of two screws, A smaller balance is exhibited, of almost exactly the

same construction as the preceding; it is capable bably) of carrying a kilogramme in each pau. A Prize

Medal was awarded to Mr. Bache.

DELUCIT (France, No. 160, p. 1178) exhibits a large balance, capable of carrying two kilogrammes in each pan. The middle knife-edge rests upon a plane surface of steel. The pans are suspended from plane surfaces of steel, which rest upon the extreme knife-edge. Screw adjustments appear to be avoided, in order to secure invariability in the positions of the knife-edges. The cast-iron base of the balance has holes under the extreme knife-edges, for suspending large globes of glass for weighing gases, in an enclosed space beneath the base of the balance. Both the construction and workmanship of

this balance appear to be extremely good.

A chemical balance, by the same exhibitor, capable of carrying 300 grammes in each pan. The pans are of platinum, suspended by silver wires.

Another chemical balance, capable of earrying 200 grammes in each pau; the pans are of platinum In these two balances the middle knife-edge rests upon a plane surface of steel. The pans are suspended from

slightly curved steel hooks, Balances of this construction, though considerably inferior to that in which the pans are suspended from plane rior to that in which the pans are suspended from plane surfaces, are simple, not easily deranged, and accurate enough for all the ordinary purposes of chemistry, for which they are expressly constructed. An assay-balance, of the ordinary construction and excellent workmasship, is also from the same exhibitor.

A Council Medal was awarded to M. Delcuil.

COLLOT, BROTHERS (France, No. 1155, p. 1233) exhibit a large balance, capable of carrying two kilogrammes in each pan. In its construction and excellence of execution, it very closely resembles the large balance of M. Deleuil.

An assay-balance of the ordinary construction is also

exhibited by Messrs, Collot. A Prize Medal was awarded to Messrs, Collot

Béranges (France, No. 761, pp. 1216, 1217) exhibits a balance to be placed upon a counter, with platforms for holding the substance to be weighed, and the weights. With fifty kilogrammes in each pan, the addition of one gramme to the weights in either pan causes the index to move through about a quarter of an inch. When tried with twenty kilogrammes in each pan it was found to turn very sensibly on placing half a gramme in one of the

M. Béranger also exhibits a steelyard in which the weight is moved along the arm by a screw of the length of the long arm, and parallel to it, having a bend of about 4 inches diameter, divided into 100 parts. This steelyard is sensible to 100 grammes, with 1,000 kilogrammes sus-

pended from the short arm

Also, bascule en l'air, a double steelyard. The end of the short arm of a steelyard is connected by a link with the extremity of a lever, and at a distance from the fulcrum of the lever equal to a small fraction of its leacth is a knife-edge, from which the substance to be weighed is suspended. One of these, capable of weighing 1,000 kilogrammes, costs 260 francs.

M. Beranger exhibits a model of a machine for determining the pressure exerted by each wheel of a loco-

motive. Also, a peso-compteur, a weighing-machine, which registers on a sheet of paper the weight of every article weighed. Besides these there are a great many commer eial balances, all of which are most ingeniously contrived, extremely well made, very accurate, and considering the workmanship, and the number of adjustments to be attended to, very cheap. Although the Jury considered them well deserving such reward, no Medal was voted to M. Béranger, on account of these being commercial balances, and as such thought by the Jury to belong to instruments for direct use, rather than to philosophical instruments: they have, however, received a prize in

Sacuti (Belgium, No. 504, p. 1167,) exhibits a large balance, capable of carrying two kilogrammes in each The manner of fixing the extreme knife-edges to the beam is different from that usually adopted, in which the under horizontal surface of the knife-edge is in juxtaposition with the horizontal surface of the beam, widesed at that particular part, and firmly fixed to it by one or more screws. In M. Sacré's bulance, on the contrary, the more screws. In a carre's outsize, on the contrary, the ends of the beam terniante in vertical plane surfaces, to which are attached, by servers, vertical plates of steel, terminating above in knife-edges. The pans are suspended in such manner, that their swinging in any direction has no tendency to twist the beam of the balance.

This instrument is remarkable for the extreme beauty

of its workmanship.

M. Sacré also exhibits an assay-balance, in which, contrary to the usual construction, the pans are suspended from plane surfaces of steel which rest apon long knifeedges, and are supported independently of the beam when the balance is not in action : it is therefore not only more accurate than ordinary assay-balances, but is embled to carry 20 grammes in each pan without injury. The work is extremely good.

In assay-bulances, as usually constructed, the paus presuspended from hooks, which themselves rest on books worked to a fine edge, attached to the eads of the beam, and are not calculated to carry a weight of more than

A Prize Medal was awarded to M. Sacré,

A. OKRTLING (Prussis, (No. 87, p. 1053) exhibits a balance of very beautiful workmanship, capable of carrying a kilogramme is each pan.

The knife-edges are let into dove-tailed notches in the

beam.* The adjustment of the distance of the extreme knife-edge from the middle knife-edge is effected by means of a vertical cut in the metal of the beam, which may be slightly widened or contracted by screws. The agates which rest upon the extreme knife-edges, and from which the pans are suspended, are not plane, but have an obtuse re-entering angle, into which the less obtuse angle of the knife-edge enters, and are not suspended independently of the beam when the balance is not in action. Two thermometers are placed with the bulbs as high as the beam; but it probably would have been better if the bulbs had been pinced a little above the scale-pans, for the temperature of the air immediately surrounding the ubject to be weighed often differs sensibly from that of the air in the over part of the balance-case Ourtling has also two smaller balances, of similar con-

netion, struction, capable of carrying 100 grammes in each pan, A Prize Medal was awarded to Mr. Oertling,

HEIMANN (Prissis, No. 86, p. 1053). Halance, capable of carrying one kilogramme in each pan. The knife-edges are opposed to agate planes. The adjustment of the position of the knife-edges is effected by means of an ablique out at each end of the beam, the breadth of which may either be increased or diminished by screws. This is the only balance in the Exhibition in which a circular level has been adopted. The Jury considered it worthy of Honourable Mention.

HOFFMANN and EBERHARDT (Prussia, No. 88, p. 1653) have exhibited balances for apothecaries: they seem well and a fourth 25 grammes in each pan.

A Prize Medal was awarded to Mesers, Labme

BATKA (Austria, No. 135, p. 1014) exhibits a very small balance by Kusche, of Vienna, contained in a platinum " It is doubtful whether this mode of attaching the knifeedge is quite as good as when the beem is made wider at the extremities and the middle, and the whole length of the

knife-edge rests upon it.

† The form of the sgates seems to be objectionable. In the present case, too much reliance seems to have been placed on this mode of adjustment; for one of the outs has been widened by screwing till a crack in the beam

has begun to form.

blowpipe apparatus. It is very well made, and the Jury deemed it worthy of Honourable Mention,

Dolberg (Mecklenburg-Schwerin). Balance, to carry one kilogramme in each pan. This balooce is in many respects very well constructed: but the middle knife-elecis supported by two agate planes, and the bearings of ti knife-edge on the planes are rather short, both of which circumstances are defects. The oscillation of the pans is checked by hair-brushes, which on turning a handle second till the ends of the brushes touch the under-sides of the pan: in this arrangement there is reason to appre-hend that loose hairs might attach themselves to the under-sides of the pans, and so lead to an error in the weighing. The pans are suspended from plates of steel, having plane surfaces, which rest upon the extreme knife-

edges A Prize Medal was awarded to Mr. Dolherg.

A FIRE Jacolal was awanded to Jar. Lionerg.
Brokers (Netherlands, No. 83, p. 1147). Balance, capable of carrying one kilogramme in each pan. The beam is a single bar, the middle kinfle-edge being supported on two agate planes.† The contrivance for lifting the pans and beam when not in action is ingesious, linamuch as the motion is slow at the time the beam is depomuch as the motion is now at the time the coast is orga-sited on the middle support, and the agate planes from which the pans hang on the knife-edges; but it is unsteady in n lateral direction. There is also reason to apprehend the extreme knife-edges would not touch the agate planes in the same parts in successive weighings. The method of attaching the pans to the hrass rods by which they are suspended, in such a manner as effectually to guard against apsetting the pans wherever the weight may be deposited. is extremely simple and ingenious. The Jury considered it worthy of Hononrable Mention.

Nieszn (Denmark, No. 20, p. 1356). A large balance to carry 10 lbs. (4-54 kilogrammes): the middle knife-edge is cut away in the middle, so that the bearings of the edge on the middle plate are too short. The pans are suspended from plates having concave surfaces, which form of plate is objectionable. They are not supported lodependently of the beam, when the balance is not in

The excentric motion for putting the balance in action

A small balance exhibited by Nissen, capable of carry-ing more than 100 grammes. The middle knife-edge in this, also, is cut away, so that the ends only touch the plane surface on which it rests. The balance in other respects resembles Rohinson's balances, except that the middle knife-edge rests npon two planes, and that the plane surfaces are of steel instead of agate. It is fur-nished with Wollaston's contrivance for elecking the

cillation of the pans and beam. The same exhibitor has also a small assay-bolan The Jury considered Mr. Nimen as deserving Honour-

able Mection

ADDE MECTION.

LITTMAN (Sweden, No. 15, p. 1350). In this balance
the index is at one end of the beam. In addition to this
index there is another pointing apwards, the end of which is viewed through a compound microscope, having a divided scale or glass in the focus of the eye-piece. This contrivance for reading off the extreme portions of the balance during its oscillation is far inferior to a graduated scale, attached to the beam of the balance, observed with a compound microscope having a single wire in the focus of the eye-piece. It also adds greatly to the bulk of the balance-case. The Jury considered this balance deserving

Honourable Mention. VIBERG (Sweden and Norway, No. 14, p. 1350) exhibits a chemist's balance, which the Jury considered worthy of Honourable Mention, it being well adapted for the purposes it has to perform.

Coin-Weighing Machines.

We will now turn our attention to another class of balance, recently introduced, viz., coin-weighing machines Of these there are three in the Exhibition-one exhibited by W. Corron, Esq., late Governor of the Bank of Eng land; a second by Captain SHITH; and a third made by DELECT. (France, No. 160, pp. 1178-1180); this last instrument was designed by Baron Skotten.

Before proceeding to the particulars of these beautiful struments, it may be well for a short time to dwell upon the want which has called there into existence, as kindly explained by William Miller, Esq., of the Bank of England. All sovereigns brought into the Bank of England by the public are weighed singly, and this is found to be solutely necessary; else the stock of sovereigns in the Bank would very soon fall below the legal current weight of 122½ grains each. The Bank, therefore, is compelled to weigh all the gold coin it receives singly, to guard

against loss. In June, 1842, the Queen's Proclamation was issued commanding all persons to cut and deface whatever gold coin was found to be below the current weight. Before that time the light sovereigns, though they were rejected by the Bank, were accepted almost everywhere for their by the mank, were accepted almost everywhere for their fall value, and the public were not disposed to criticise very nicely the Bank's weighing, as the rejection of their money occasionally, when it was really of the current weight, or the issuing it to them a trifle below the weight, was of small consequence; for, though it might occasion a little trouble, it entailed no loss. But it was quite n different affair when their sovereigns were cut as well as rejected, so that they were obliged to sell them as bullion, sometimes at a loss of three-pence or four-pence a-piece; or when, as was sometimes the case, they received sove-reigns at one counter of the Bank which were cut and returned to them when tendered at another. The public then, as might be expected, were very angry; but there was no help for it. The Bank had provided the best scales that could be procured; they had the most expescare that could be procured; they and the most experienced weighers; they re-weighed singly every gold coin in their stock, amounting to apwards of £8,000,000, and weeded it of all the light pieces that could be detected, at n loss of between £3,500 and £4,000; but the evil remained, Sovereigns were still issued at one counter which were rejected and cut at another,

This did not arise from any fault either of the Bank or of its officers, but from the inherent difficulties in the operation of weighing so necurately as was necessary, or with the same result, in a limited time, even with the best-constructed scales. Some of the causes of error Mr. Cotton ascertained to be-differences in the weights made (notwithstanding the Mint stamp attached to them) of considerable amount in relation to the degree of correctness required; currents of air acting intequally upon the scale-pans; a constant diminition of the weight of one pan, by the act of placing and displacing the coins to be weighed, hy which the equipoise was every moment destroyed; the striking of the scale-pans upon the counter; difference in the judgment of the weighers; the short time which could be allowed for the operation; failing of the eye-sight, fingging of the attention, and steepiness from the monotony of the employment; difference in the rate of vibration of the beams; defects of principle in the construction of the scales, to obviote which would have destroyed their simplicity and marred their general use-

All these difficulties (and they were great) were overcome by Mr. Cotton's machine; and since the year 1844, out of the large number of 80,000,000 of pieces which have been weighed, not a single source of error has been made out against them. Some few sovereigns are still weighed as they are received from the public by the conmon scales; but such are never re-issued by the Bank until they have passed through the machines, which ex-tract from them about two per cent, of lightness. The Bank sustains the loss apon these nanvoidable errors, in preference to the loss of time, the trouble, and the vexation which the re-issue of them as they were received

from the public would occasion to all parties We now proceed to the description of Mr. Cotton's

It consists of a square brass box: on the top is placed a hopper to hold the sovereigns to be weighed. This hopper is a long trough, placed at an angle of about 45°

^{*} This contrivance is greatly inferior to Wollaston's for feeting the same purpose.
† This is not a good construction.

with the top of the box: it will hold about 500 sovereigns. In front of the box are two small apertures, to which are fitted two receivers, one for the sovereigns of full weight, the other fur those which are light.

Inside the box, and uear the upper plate, the beam or balance is placed; at me end of the beam, and above it, is polsed upon a knife-edge, a small platform, which re-ceives the sovereigns to be weighted. This platform, which, in fact, is one of the scales, is kept in its position hy means of a small pendulum, on which, at about an ch below the platform, there is an oblong perforation, about half an inch in length, technically called a slot, in which a small ivory rod works freely up and down with-

ont touching the sides. Between the slot and the platform a pair of foreeps is placed. From a knife-edge at the other end of the beam placed. From a killic-edge at the other end of the beam a small round polished platn is suspended, to which a peedulum is fixed, and at its lower part the reals is placed to receive the weight. Above the small round plate, under the top of the box, is fixed an agate with e blust point. When the machine is in motion the small livery rod is depressed: this, on touching the bottom of the slot, or opening in the pendulum in which it works, brings down the beam on that side, and raises it, of course, on down the beam on that sade, and rasses it, of course, on the other, the eight side, mult the small round plate on that side bouders the supart point. The same far from that the bouders the supart point. The same far from expectation of the problems between the platform and the slot, and bold it firmly. The bulance is then in a condition to receive the sovereign, which is shifted from the bottom of the pile in the hopper, and hrought by means of a slide abung a channel, just large enough for a sovereign of the proper standard gold to pass, but not large enough to admit a counterfeit, and deposited upon the platform. The forceps theu let go their hold, the ivory rod is gently raised, and if the sovereign happens to be light that end of the beam rises, and the other end leaves the agate point; but if the sovereign be full weight,

reaves me agate point; but if the sovereign be full weight, the beam remains stationary, and the small plate on the weight end is in contact with the agate point. When the sovereign is weighted, the operation of its re-moval is very ingenious, and is an follows:—Two bolts are placed at right angles to each other, and on each side of the platform or scale there is a next cut. of the platform or scale there is a part cut away to admit of the bolts striking so far juto the area of the platform as to remove anything that would nearly fill it. bolts are made to strike at different elevations, the lower oun striking (as to time) a little before the other, If the sovereign be fall weight the scale remains down, and the lower bolt knocks it off into the full-weight box. If the lower bolt knocks it off into the fina-weight nos. no sovereign, on the other hand, be light, it rises up, the first bolt strikes nuder and misses it, and the higher bolt then strikes need a knocks it off into the light box. This machine weighs about thirty-three sovereigns in one minute. The weights used are of glass, and are adjusted to within the teu-thousandth part of a grain.

It is uederstood that these machines, since they began to be used in 1844, have not cost £5 for repairs, and that they effect a saving in salaries alone of full £1,500 per annum, after deducting ten per cent. for the replacement of capital sunk in their establishment. A Prize Medal was awarded to Mr. Cotton

SHITH (India) has exhibited a coin-weighing machine which is an exceedingly ingenious application of that of the areaometer or hydrostatic balance. The counterpoise to the point weight of the scale-pan and coin is made to rise and fall in a eylinder of water, the oscillation being desdened by a circular plate forming part of the counter-poise wholly immersed in the fluid, and of such an area as to afford considerable resistance to the rising or sinking motion. By a proper adjustment of the diameter of that motion. By a proper sujustament of the diameter of that portion of the counterpoise which is partly beneath and partly aboru water, and of the length of the kerer arm which carries the scale-pan, a given deviation in the weight of the coin one way or other from its legal weight may be made to correspond with a given depression or ele-vation of the counterpoise, and therefore of the scale-pan.

below or above a certain medium or zero position, the scale resting at a level, curresponding to the amount of excess or defect of the coin above or below the standard,

At levels corresponding to half grains of difference of weight, shelves are placed which receive the coins from the scale-pan, according as, on arriving at its point of equilibrium, it happens to be opposite to the interval be-tween either shelf and the next above it; and once thrown upon that shelf, it glides down and finds its way jete a receptacle corresponding by an appropriate passage. Thus grains of weight.

To throw the coin off the scale upon its proper shelf, the scale-pan is peculiarly constructed of wire, borizon the scale-yam is peculiarly constructed of wire, horizon-tally laid, no as to clion's acraper, also of wire, vertically arranged, to pass between and beside the framework of the pan, which, being pashed along at the end of each weighing, the coin is sforced by it off the pan pipon the shelf. The pash-frame, thus lightered, riese to the proper position for receiving another coin, which is placed on it by a feeding-pipe in the manner usual in coliniag pro-

Any number of small weighing-machines may be mounted sidn by side, so as to occupy a very mod compass, and may be worked simultaneously by a common feeding and a common discharging movement; and all may be made to discharge their contents on the same shelves conducting to common receptacles.* A Prize Mcdal was awarded to Captain Smith,

DRIEGH (France, No. 160, pp. 1178—1180) exhibits a benefiful coin-weighing machine, invented by Boron Seguier, Membre de l'Académie des Sciences, differing, however, from those above described in its mechanical

however, from those above described in its mechanical arrangements, and is some particulars of construction which are necessary to its performance of the additional operation regulared by the French Bank. In the Bank of France each piece of mosey is weighted in a small bolance, especially constructed for the purpose, by mee charged with this particular duty. The beautiful culture weighting machine in question is designed to super-culsive eighting machine in question is designed to supersedo this work by mechanical means. In its working it exhibits quickness and regularity in performing the operation of distributing the pieces into three classes, thore which are heavy, those which are of exact weight, and those which are light,

The instrument is distinguished in its operations from Mr. Cotton's, by thus distributing the pieces into three classes instead of two, as in Mr. Cotton's, the three being necessary in the Bank of France, though not required in England.

The right to this elegant invention not being secured by a patent, its internal construction could not be ex-amined; but so far as could be judged from working it. as exhibited, the principle seems to be the making avail-able the declination of the index of the balance, or light steel rod, to the right or left of the vertical, according to the execus of weight in either pan, to give motion to one er other of two light brass plates is the act of raising the balance. The force so applied being, not the mere dif-ference of weights between the scales, but an external ference or weights between the scham; the motion thus power applied through this medium; the motion thus given to the hrass plate being conveyed downwards by an appropriate train of mechanism might easily be applied to an interposed obtacle or otherwise. The coin, on its which it would have followed had the index remained vertical, into one of two other channels according to the inclination of the index.

The machine is fed by a hopper, the coin being thrown promiscoonsly in. To prevent its jamming, and refusing to pass, it is constantly stirred from below upwards by a wheel set round with steel pins so as to disturb the selfrangement of the coins in the hopper, and let them fall over one by one into the feeding-trough. It is un-derstood that about fifty coins could be weighed per minute by a double machine, such as that exhibited, The working appeared to be not quite continuous, but in all other respects perfectly satisfactory, the interruption

A full description of this ingenious mechanism, which was contrived and executed for the Madras mint under Captain Senith's direction, will be found in the "Professional Papers of the Madras Engineers," vol. ii.

to the regular delivery of the coins being little more than momentary.

It will be understood that, for the reason above assigned, this account of its operation is merely conjectural. Sir a machine for a similar purpose, founded on the principles, first, of preventing the descent of either scale, unless the excess of weight in it surpassed the legal "remedy," and allowance for wear and original error, which might be done, by giving each end of the beam a support from below equal to the remedy, but rising only on its descent; and, secondly, by presenting in the closest proximity to the under-side of the beam, but not in actual contact, the extremity of a conducting rod of copper, completing a galvanic circuit through the beam and its central steel uife-edge resting on a steel plane, and thus animating one or other of two electro-magnets, which by its attraction on a soft iron bur should shift either the point of delivering or the point of reception of the descending completed, the right-hand conductor would thus deviate the coins into the receptacle for heavy, and the conductor on the left into that for light coins, while a state of rest of the beam, corresponding to any excess within the remedy, either way, would cause no deviation, but allow the coins to fall straight into the middle receptacle. This description might enable any mechanist to construct such a machine, probably at small cost, and without infringing any patent right.

It is highly antificatively to find an instrument of made high importance are habasen ow well speciested in the Dahlahur, and when it is the horse very resolved three to be a subject of the state of the contract of the contractive of the contractive of the contractive of the amountain to the exhibition of good balances to have pretained as the contractive of the contractive o

Air-Pumps.

Most of the important facts which we know relative to the properties of air may be said to have been elicitied by the employment of the air-pump. It is satisfactory to find that the Eulibilium contains instruments of a new and improved construction; but it is matter of regret that so small a number of misunfacturers have contributed.

The air-pamps most commonly note are must either with braus trop-cock, or with valves of celled tilk or with braus trop-cock, or with valves of celled tilk or leader. The former, when properly constructed, and were groundly are truly or channing the air hormoghty. I will be a second to the construction of the construction of least accurate than those fromished with valves, after an equal amount of wars. But the valves themselves are also imperfect, owing to the pressure of the external air on that within the prison pre-resting the latter from rising to on that within the prison pre-resting the latter from rising the thind difficulty have been nucle in the pumps exhibited, some of which are very susperior in their zeiton, and have

probably never been impassed.

The exhibitor of the best sir-pump in Newara (No. The exhibitor of the best sir-pump in Newara (No. The exhibitor of the best sir-pump or the ment to be the pump of the ment whatever on one of these are two hardes, one of the values on one of these are two hardes, one of the values on the same pump in the same pum

of air-pump exhausts more thoroughly than any yet known.

In the experiments which were tried, the reading of the barometer at the time being 30'08 inches, the gauge of the air-pump stood at 30'06 inches. A Council Medal was awarded to Mr. Newman for this air-pump.

We see so that I had, No. Co. P., 6657; whils it was considered and the seems, on a plan negrent by Mr. other hand prompting the plan of the least possible resident of air in the heart, to leave the least possible resident of air in the heart of a seems and the seems

Kentur and Soos No. 636, p. 609 exhibit an sirpung on Sensen's pates. It remains for very jidaden, pung on Sensen's pates. Variey and Sons also exhibit a second air-pump, smaller than the former: it has a double-acting barrel. The piston is worked by means of a crank and continuous circular motion of the handle.

HEYWOOD (No. 404A, p. 453). A rotary table airpump, with self-opening valve worked by a crank motion. It acts with singular smoothness and ease.

GOORTY (No. 407, p. 454) exhibits an air pump of the common table form. It gave an exhaustion of US land of mercury, which is considerable for this kind of air-pump.

LADD (No. 291A, p. 440) exhibits an air-pump, which is single-harrelled and of a cheap construction, without any other claim to notice.

Yearns (No. 332, p. 446) exhibits a double-acting nirrpump of a cheap construction, which appears to be good for its price. Its valves are of oiled silk. The commonication is in the middle of the barrel, a valve being placed there and at each end. Honourable Meution was awarded to Mr. Yeates.

Bayan (No. 408, p. 454) has exhibited a double-action air-pump, constructed without valves, and having a rotatory motion. The pump consists of a barrel, to which two smaller once are attached on either side. In the

large or prime barrel is a solld piston, which may be made to rise and fall at pleasure, and is attached to a piston-rod; in the centre of the secondary barrels are also small pistons, whose movements are simultaneous, Each rise and fall of the large piston is designed to draw off from the receiver 53 cubic inches of air, simply by its off from the receiver 32 cause inches of ar, simply ay in own elasticity. The double action, combined with the rotatory motion, has been introduced with a view to economise both time and labour, and the absence of the valves, to avoid the limitation of exhaustion attendant upon their use. This pamp was ant tried, in consequence of no one being in attendance on the Jury to explain its action, &c.

BRETON (France, No. 1113, pp. 12, 31) exhibits a double-harrelled air-pump, It has, instead of valves, a glass plate sliding over apertures communicating with the receiver and the pamps. The motion of this glass plate is produced by the mechanism which works the pump; it is very ingenious in its construction. The approximate exhaustion is first made by the ordioary alternate action of the barrels. The system of communication is then changed by shifting round the glass plate, which serves as a valve during one-fourth of a revolution, when the rarefled air is condensed in one burrel and sucked into the other, whence it is ultimately ejected through a valve of oiled silk very close to the piston. On account of the of olicid stilk very close to the piston. On account of the distance between the pumps and the glass plate, however small the pipe of communication, the exhaustion must be imperfact. The syphon gauge attached to the instru-ment indicated an elastic force of only one millimetre of a column of mercury; but a habible of air was seen at the top of the mercury, proving its indication to be

DELECTIC (France, No. 160, pp. 1178, 1179, 1180). This exhibitor has a double-glass barrelled air-pump, on M. Habinet's principle, the valves being opened by means of wires passing through the pistons. The opening of M. Habinet's principle, the varyes using opening of of wires passing through the pistons. The opening of the valves is by this means rendered independent of the clustic force of the air remaining in the receiver. The degree of exhaustion which can be produced must depend on the air after the action of the piston. This appeared by the syphon gauge to be about one millimeter of mer-cury; but the top of the gauge could not be seen so as to ascertain whether any visible portion of air was there. In this pump, also, the vacuum is first approximately made by the alternate action of the barrels, after which one barrel exhansts the other by suction.

NISSEN (Denmark, No. 20, p. 1356) exhibits a doubleacting single-barrelled air-pump, of an ingeninas con-struction. This instrument only exhausted to 0'3 incb, struction. This instrument only exhausted to up theo, as shown by the gauge, which was free from any visible speck of air. The Jury considered this pump as worthy of Honourable Mention.

Optical Instruments,

The telescope is an instrument of such high importance, that it ought to command at all times, from opticious, the incessant direction of their attention to its improvement and the bringing it to the highest possible state of per-fection. In the Exhibition, if we except those affixed to tronomical instruments, there are but few telescopes Of these the larger are for the most part good, Waay exhibits one with discs of a solid substance, instead of flint glass, which deserves commendation, as a deviation from the beaten path, that may conduct to new and im-portant results. There are few samples in the Exhibition portant results. There are few samples in the Exhibition of optical glass; but all are good, and give great promise of an increase in the use of large telescopes. SIMMS exhibits several object glasses made of English glass; and CHANCE contributes a noble piece of apparently pure flint glass, of no less than 29 inches in diameter. Daguer ming goos, of no lees than 20 incines in diameter. DAOUTH seeds some wonderfully pure glass, both crown and flint. Of lenses and prisms, there is not one Hritish contributor; Prance standing slone in the exhibition of some very beautiful wark, which reflects high credit upon Bayrana. and Berkraun. Of physical optiles, there is hat one extensional prices are in the contributors. aive exhibitor, viz., Dunosco Solkil, France (No. 1197. p. 1235), who has a beautiful collection of most delicately onstructed instruments, adapted for physical investigation. Of microscopes there are a good many exhibited

among which the English microscopes are found to stand pre-eminent. Of lighthouses there are two, the one being made of glass almost colourless, and the other with that of a greenish colour. The glass of neither is pure, there heing many strin, &c., which must caose much light to be scattered and consequently lost. Of speciacles and cameras we shall speak in the proper place,

VARLEY and Son (No. 257, p. 436) exhibit an app to be used in Gregorian telescopes, consisting of three small speculums, grouped together on one stem, and fitted into a telescope, under adjustment from the eye end, by means of which any one of the three may be used at pleasure, so that the power may be changed with-out losing sight of the object. Within the tale are placed two slides, one near the eye end, adjustable by a screw; the other near the object end, which may be moved to and fro. The latter carries three small spemoved to and ro. In muter carries three amas spe-culums, of different foci, mounted on a steel axis, held in a stiff frame. At the bottom of the axis is placed a toothed wheel and rack-work. This rack is kept from moving hy a long bar proceeding from the first slide, so that it cannot move with the able on which it lies; hy this arrangement, on moving the slide, the wheel upon it will roll against the rack, and so present the next

The angle at which the speculums are opposed to each other on the block determines the number of teeth, or portions of the circle required to present each speculum. The diameter of the wheel determines the distance that such portions of the wheel must traverse to put each speculum in true focus. The slide nearest to the eye end is moved by n long bar, attached to it by means of a screw, whilst its near end lies on the other slide, and over the loop-hole. The bar has a screw handle on the outside of the telescope, by which to pull or push the further slide, and also to clamp it fast to the near slide when in the right place. This clamping connects the two slides, and causes both to obey the adjusting screw, In order to determine the exact places at which to clamp, the har is fornished with three notches, whose distance the har is formished with three notches, whose distance corresponds with the difference of fee; a tooth snaps into each notch as it arrives; the hand of the observer feels this snap, and the object reappearing at the same instant, the screw is made fast. Having brought each speculum to its right distance, its perfect position is effected without trouble. The speculum wheel has three pios; against one of these a notch in the bar is urged by a spring, which holds its corresponding speculum per-fectly in place, and in addition, moves the wheel and rack a little further than the hand and bar had formerly done. This simple action separates the two hooks, and thereby detaches the apparatus from each speculum whilst it is in use, leaving it at liberty to be governed only hy its pin, and the notch in the bar already mentioned; the speculum by these means is held perfectly in its place. A cylindrical cap, as a protection from the weather, is made to slide over the speculums, and affords weather, is injusted to the over the speculams, and amoras a dark margin round the pencils of light. This contrivance has been applied to telescopes of eight inches focal length, and six inches aperture.* The Gregorian focal length, and six inches aperture. * The Gregoriaa form of telescope is the shortext, and consequently host form of telescope is the shortext, and consequently host as compared with others of equal power; from its large proportionate aparture, it gives a smaller due to the stars, and does not require a deep eye-pecce, but it is desirable to chain power by deeper and smaller speculous telescope, of two inches aperture, and six inches fixes, it is monated on brans stand, and galmits of being it is monated on brans stand, and galmits of being

rendily packed away in a small box. When held against a post or tree, the foot and telescope form a firm triangular bearing.

As in ordinary Gregorians, the length of telescope in-erences the power of the small metal reflector, so that a small portion only of an object can be seen at one time

* This contrivance received last year (1830) the large

through the central aperture, it follows that with a sufficient field of view, we cannot have as low a power as would be desirable, without increasing the central sperture and the small reflector so much as to injure the telescope for the reception of high astronomical powers. To obviate this, if possible, Variey and Sou have, in the first instance, made the great speculum of the shortest eligible focus, by which means the power of the small speculum is lessened and brought nearer, the angle of view being increased in the same degree. The small speculams are mounted in tubes of any length less than double their This arrangement gives a more effective dark fecus. This arrangement gives a more effective dark margin around the pencils of light, and such as would require a larger disc if placed behind the speculnus. Small speculnus of longer focus may thus be used with no greater obstruction of light, and an equally good field retained with a lower power. The mounting the small speculnus in tubes effectually seemes them from julyry feens. whilst in place, and when removed, a small cap com-pletely excludes them from the air. The arm which supports them remains in the tube, it having a concentric ring, into which the small tubes are screwed for use, and from which they are more easily detached than when

from which they are more easily detached than when affixed to separate slides in the common way. Hoss (No. 254, pp. 435, 436) exhibits a telescope of 5 feet focal length and 2] inches aperture, of English flint glass, which, examined on test objects at 150 yards (consisting of two black marble balls, highly polished, placed in full sunsbine; a watch-dial, and small balls of white ivory on a black ground), was found to perform well, giving well-concentrated images of the artificial stars produced on the marble balls, with but a small trace of uncorrected colour.

A Council Medal was awarded to Mr. Ross for this telescope in coanexion with microscopes, Callaguan (No. 268, p. 437) exhibits a telescope in-tended for use in deer-stalking.

SALMON (No. 266, p. 437) exhibits several day and ight telescopes, intended for ships' use, which are good

for their price. RICHARDSON (No. 264, p. 437) exhibits a small reflect-ing telescope, of 3 feet 8 inches in length. The large reflector, made of one piece of solid crown glass, was either painted, or had paper pasted against its back, there-hy giving it that tendency to change figure by bent, against which Sir John Herschel has so strongly cautioned

all constructors of glass mirrors BOTLE (No. 392, p. 451) exhibits a reflecting telescope, intended for use without a tube,

Waar (No. 309, pp. 442, 443) exhibits a 7-feet refract-ing telescope, with 44 inches aperture. The peculiarity of this telescope is the substitution of a solid substance instead of flint glass. (See Illustrated Catalogue.)
On trial it was found to be badly achromatised. The

colour above the image did not seem to be that usually called the secondary spectrum, but a remain of colour not fully compensated. The glass was neither fully corrected for sphericity nor for colour. It was observed that the object lens had rather a strong yellow tint, and was somewhat blotchy, as if the material used was not quite aniform in colour; all interior reflections were stroyed, so that it could not be suspected to be other than a single glass. As a telescope it is not very good; but, though an imperfect trial, it is yet a fair attempt to move out of the beaten track, and as a step towards the possible revival of fluid or semi-fluid object glasses,

WATKINS and HILL (No. 659, p. 466°) exhibit a teleope 34 feet focal length, and diameter of object glass 23 inches, furnished with a finder, vertical and horizontal rack-work motion, and eye-pieces with powers to 220,

Manager (No. 409, p. 454) sends an achromatic telescope of 5 feet focal length; it is furnished with powers of 65, 85, 120, 200, and 280. On trial it was found to be good, and to deserve Honourable Mention.

Hanns and Son (No. 149, pp. 428, 429) have a micro-metrical and double image telescope and "coming-up for measuring distances either on land or sen,

This instrument is designed for the purpose of ascer-taining the distance and dimensions of any inaccessive

object by means of simple calculation; also to determine. without calculation, the distance of any known object by means of a set of tables adapted to the scale. intended to act as a micrometer for the purposes of astronomy, and as a "coming-up glass," to ascertain whether a ship be approaching to the observer or receding from

him, and withal to combine simplicity of construct Benon (France, No. 443, p. 1199) exhibits a telesec the object glass of which is of rock crystal, 4 feet 2 inches in diameter, and 6 feet 3 inches focal length. Attached to the telescope is a finder, which embraces a field of view from 5° to 6°, and has cross wires, which, owing to the great illumination of the field, may be seen during the dearkest night, and consequently the star brought into the centre of the field. On examining this intertument it was found to be good in every respect. It is fixed upon a very steady cast-iron stand, furnished with three small castors, brought into operation by means of rack-work when necessary to remove the instrument

The object glass of this telescope is of rock crystal which requires great care in its prepartion on account of its property of double refraction. In its working the following particulars are necessary to be attended to:-

 The crystal must be cut perpendicular to its axis.
 In working the axis, the spherical surface must always coincide with the axis of crystallization, 3, The curvature of their surfaces must not be made too large in the angles, as double refraction would then be

visible to the eye. M. Biot has shown that an angle of 5" must always exist, but that this is not visible to the eye."

The formula of Huygens has been used in working the rock-crystal object-glass; it is as follows:-Supposing that the refractions, both ordinary and extraordinary, take place in the plane of the principal section.

$$m' \equiv \sqrt{\frac{m^2 \cdot m^{-2} (1 + a^2)}{m^2 \cdot a^2 + m^{-2}}}$$

in which m' = The index of refraction. the Jens

m = The ordinary index, or minimum.

m = The extraordinary index or maximum.

m = The tangent of the angle of ordination of the luminous rays with the axis of

Thus m' is always an index of refraction, intermediate to m and m".

M. Baron has also exhibited another telescope of about the same dimensions, which was found to be good, supported upon a stand, invented by the late M. Cauchois, the appearance of which is elegant, but as it compels the observer to stand during the time of observation, and as it is necessary to be moved entirely when large azimuthal angles have to be passed over, it is less convenient than the east-iron stand before described. It is made of wood, which, though rendering it liable to be affected by varia-

tions of moistare, gives it the advantage of being lighter than one constructed of iron M. Baron has also exhibited telescopes of various sizes, provided with terrestrial and celestial eye-pieces, and mounted upon brass stands; also nautical and pocket telescopes. In the construction of his eye-pieces, M. Buron pays strict attention to the rules of M. Biot Many of the portable telescopes were tried, and their

performance was found to be very good; they are rearksbly ches A Council Medal was awarded to M. Buron. LEBBUN (France, No. 298, p. 1191) exhibits several achromatic telescopes of a very good kind, and which are

remarkably cheup.

Kinzzinacu (Wurtemburg, No. 26, p. 1115) has exhibited an achromatic telescope of about 2½ inches aperture, and 234 locbes focus, constructed on the dialytic principle, in which the correction of the dispersion of the crown lens is performed by a flint lens of only half the aperture, placed mid-way between the crown lens and the

* See Biot, "Truité d'Astronomie Physique," vol. il., 1844, and vol. ili., published lo 1846; also "Memoires sur les Oculaires Multipliées et Achromatiques, présentés à l'Academie des Sciences, 1843."

joint four; a principle of compensation originating plant four; a principle of compensation originating before the following control of the control of the following control of the control of the following control of the f

Microscopes,

The Exhibition is rich in its collection of microscopes of all kinds, comprising instruments varying from the simplest forms to the most elaborate. Many of the latter have never been surpassed for power, goodness of objectglass, definition, large angular aperture, boasty of workmanahip, great coavenience of the subsidiary parts, combined with great permanence of adjustmen.

The microscopi has been rendered second in importance of you the delicacy by its application is physical according to the property of the property of the property of the discovery of many to display its great powers in the discovery of many to disciplant or appreciate their capability to distinguished or appreciate their capability beauty of the discovery of many to disciplant or appreciate their capability beauty of its any beaute of section its services are indisposable, and a various ways it may become of essential uses to every class of most its arrives are indisposable, and a various ways it may be considered to the contraction of the contraction

When Tully constructed the first adversatise objectgians in this country, in the year 1884, Pt. Gering said, "that microscopes were now placed on a level with teleercept, said, like them, must remain stationary in their properties. The said of the said of the said of the instruments in the Eabhilton has fully exemptified. To trace the causes of the sitesly and progressive improveerses of the said of the said of the said of the control of the said of the said of the said of the destrable. Mr. Bowerbank, who has always taken an active part in these improvements, has hindy furnished.

According to the design of the second processes, as a smally framidate About they are 1321 the flat effective morement was made toward applying advantate object-planes to the same of the second processes of the second processes of the second processes of Science; and Anniel rossmal the subject after an experience of the second processes of

With a happy combination of mathematical knowings and practical appringers, Mr. Laker continued to prace the subject, and in the year 1500 he published in case the subject, and in the year 1500 he published in the properties beinging to it, and a mean derived the subject properties beinging to it, and a mean derived and the contraction and contractical contractions and chromatic shorters and contractical contractions and chromatic shorters and contractical contractions and chromatic shorters and contraction to thought the author of the puper has not since published the further futus of the latter, the latter contained his contraction of the contractio

hat the accountary speculous has not been mech diminished. The half-ises focus of 70° spectore is a wonderfully fine combination, easily showing objects, considered difficult for a one-eighth inch focal length a little more than a year since, and bearing the application of the higher cycpieces in an unprecedented manner. Smith and Beck also exhibit all that is necessary for

the mounting of microscopie objects, as cells, slips, this glass, fluids, covers, &o., and a few preparations as specimens. There is, aiso, a new form of cabinet, for the reception of objects, the names of which may be exposed, by means of porcelain lades with which they are far-usabed, and from which the pencil-writing can be easily efficied.

There are two tables with revolving tops, by which the microscope can be turned readily round for the convoilence of examination by different observers, and thus readered a social instrument. The microscopes are furnished with portable aliver reflecture and annular condenser, which exhibit transparent objects spon a dark control of the control of the control of the constant of the control of the control of the conlocation and beek claim its first execution.) A Council Meal was awarded to Mearts. Smith and Feck.

Vasars and Sow (No. 317, p. 405) exhibit a microgroup, the stope of which is moved by predict sods, with compute the stope of which is moved by predict sods, with equal-to-motion is all directions, and is specially adjused to the stope of the stope of the stope of the stope of the experts point over missachile may be kept as a bring such experts as exhibit, and appeals of reverved with in which require plants or missachile may be kept as a bring such experts and the stope of owns, and thus it within the said to only cortect when mode, at which time it is held in adjustment of the stope of the stope of the stope of the said is only cortect when mode, at which time it is shed in adjustment of light and the stope of the stope of the learner of light may be made to fell upon the part under the stope of the stope of the stope of the stope of the learner of light may be made to fell upon the part under the stope of the stope of the stope of the stope of the learner of light may be under to fell upon the part under the stope of the stope of the stope of the stope of the learner of light may be under to fell upon the part under the stope of the stope

tion, is also exhibited, chiefly intended for beginners.

Varley's lever stage is very much more complex than White's; and as the lever is placed behind the stage it is less convenient to noe.

Kino (No. 287, p. 439) exhibits a microscope stand,

with misrometers and govinenters. It has a symmidate product with the control in retenting lapses by arranged that its weight is equily, distributed over the sea, and when lettered in the working angle, the principles of the control of the contro

" This instrument is fully described in the "Transactions of the Society of Arts."

worked into convex spherical surfaces, is also worthy of scope, with the body inclined in a convenient direction. potice. The Jury considered Mr. King as well deserving Honograble Mention

PRITCHARD (No. 248, p. 435) axhibits an old-flashioned achromatic microscope, with indifferent object-glasses. The working of the mechanical parts is very good. This form of instrument is that which led the way in the great advance that has been made in the microscope by the introduction of achromatic object-glasses, voted Honourable Mention to Mr. Pritchard.

LADD (No. 291a, p. 440) exhibits a microscope furnished with chain and spindle movements, in place of rick and pinion. This movement has been applied to the inicroscope many years since, by Mr. Julius Page. The motion is smooth, and totally free from loss of time, and is likely to stand well the effects of constant use. The

Jury award Humonrable Meution to Mr. Ladd.
Pillischen (No. 269, p. 437) exhibits a large microscope stand, which is good for its price, but unuscessarily large and incoorement for use. He also exhibits two small microscopes,

Jackson, E. and W. (No. 258, p. 436) exhibit plain and excavated slips of glass, sections of tubes of various forms, for the construction of cells for mounting wet preparations, and thin glass for covering them, of various thick-These materials are exceedingly useful for scientific microscopists.

HUDSON (No. 256, p. 436) exhibits microscopic objects intended for the use of the medical student, physiologist, and naturalist, HETT (No. 249, p. 435) exhibits a variety of admirablinjected microscopic objects, illustrating the utility of the microscope to the physiologist, A Prize Medal was

awarded to Mr. Hett. POULTON (No. 252, p. 435) exhibits some well-executed

microscopio objects, with drawings to illustrate their structure STARK (No. 284, p. 438) exhibits microscopio objects,

counted in getta percha ceils, instead of gioss; and also slides for exhibiting opaque objects, SHARP (No. 308, p. 442) exhibits a set of high power lenses, ten in number, for a microscope from one-tenth to

one-hundredth of an ineb focal length. SHARBOLT (No. 677A, p. 469a) exhibits a sphero-annul condenser, for concentrating light on transparent objects while under microscopio examination, the object alone being illuminated whilst the field of view is dark. A

Prize Medal was awarded to Mr. Shadbolt, The principle of this condenser was suggested by Mr.

J. F. Wenham, of Brixton, in his parabolae condenser,
Mr. Shadbolt's condenser carries out Mr. Wenham's principle, with the advantage of superior reflecting arms ments, greater facilities of construction, and less liability

of derangement, Other microscopes are exhibited by Figgo and Son No. 250, p. 435), ELLIOTT and Sont (No. 320, p. 443), WATKINS and HILL (No. 659, p. 466°), ABBAHAM (No. 263, p. 436), GRIFFIN (No. 457, p. 463); but they are not such as demand especial notice.

Let us now turn our attention to the microseo Let us now turn our attention to the microscopes ext-hibited by France; and first in order is NATCHET (France, No. 1370, p. 1242). The object-glasses, though inferior to both those of Ross, and Smith and Beck, are by far the best of the foreign costs. They vary from a focus of one inch to that of one-eighteenth in an inch. The following were examined: that with-1sth of an inch focal length, has an aperture of 134

and although the method of adjusting by the separation of the lenses, invented by Ross, is adopted, yet the system is such that they are not correct at any distance. The workmanship of the stand is very good; and there are two ingenious forms of microscopes exhibited. One has the object-glass below the stage, with the tabe inclined at a convenient angle and a reflecting prisas for the examination of ebetsicals, or for dissecting transparent objects under fluids. The other is a dissecting micro-

and the image erected by reflecting prisms, so as to enable an observer to look in a convenient position whilst dis-secting an object in fluid, which must be kept herizontal. A Prize Medal was awarded to N. Naschet

Some microscopes, excellent for their price, are exhibited by BERNARD (France, No. 762, p. 1217). These instruments are the cheapest in the Exhibition, though none are of the first order. Honourable Mention is

awarded to M. Bernard,

Chevalle (France, No. 1729, p. 1239) exhibits a microscope, with iodifferent object-plasses. The work-manship of the mechanical part, however, is very good, the mode of mounting is excellent, and the instrument is convenient for all kinds of microscopic observations, Jury voted Honograble Mention to M, Chevalier.

Some excellent microscopes, for their price, were also exhibited by Benox (France, No. 443, p. 1199).

MERZ (Bavaria, No. 30, p. 1100) exhibits a microscope, the mechanical parts of which are beautifully executed. The object-glasses are of small sperture, and the spherical aberration is not corrected. The one-twelfth of an inch focus has an aperture of only 65°, and the one-eighth of

an inch that of 55 only.

Hazast (America, No. 16, p. 1435) exhibits a large instrument, furnished with very deep Huygenian eye-pieces, giving the usual extensive field obtained by such; it has, besides, two convex lenses in the body for enlarging the field of view. Neither chromatic nor spherical aberration is properly corrected, and the workmanship is

not good. PUCK (Russin, No. 170, p. 1372) also exhibits a micro-spe, but it is an indifferent instrument. We will now speak of some of the uses of the beantiful

instruments we bave just described; the most important Hastration of their ntility in the Exhibition is shown by Leonann (No. 306, p. 442), in his correct representation of many different substances, &c., when highly magnified. He has selected several articles of food in daily use, also the substances with which they are sometimes adulterated, &c., as in the subjoined list

Frame 1.

Sword-fish, transverse section of the sword, magnified 95 diameters. Small portion ditto, magnified 440 diameters.

3. Spine of Ray, from which shagreen is made, magnified 95 diameters. Small portion, magnified 440 diameters

4. Human lung (healthy) injected, magnified 150 dia-5. Human lung (with tubercles) injected, magnified 150 diameters.

These anatomical and microscopical drawings deserve very Hopourable Mention; the whole of their outlines and proportions have been executed by means of the camera lucida, so that they represent truly what the cyc actually sees, and the details are finished with scrapulous accuracy; they are, therefore, among the most trustworthy representations of minute and elaborate tissues

that perhaps have ever been executed.

Toppino (No. 667, p. 467°) exhibits five cases of microscopie objects. The contents of the first case are, test objects adapted to the present state of microscopic selence, ranging from two inches power up to one-twelfth of an isch of large aperture; also some of the most beau-tiful of the fossil infusoria.

Case 3—Contains fossil and recent vegetable structures.

Case 3—Dissections of insects. In this case are large
dissections of the respiratory systems of the silkworm,
cateroillar, and larve of beetles; all these are mounted im Canadian balsam,

Case 4-Sections of fossil teeth, bones, and shells, &c. In this case there is a diamond showing woody structure, and sections of oriental and Scotch pearls, Case 5—Contains injected animal tissues,

Mr. Topping has mounted the greater part of these objects in Canada balsam: he remarks that this is the objects in Comman summar are remarks that this is the only medium which will permanently preserves specimens of natural history as objects far the microscope, and that he uses chrome yellow, instead of vermillton, for injections, with which material he can inject the minutest

capillaries.

Mr. Topping's methods of mounting and preserving objects, are many of them of his own invention; he deserves to be distinguished above other exhibitors, as he was one of the first in the field, and perseveringly over-came many difficulties which others following after had not to eucounter. His anatomical injections are admirable, as are also those of HETT (No. 249, p. 435), hot in this branch neither of them is an original inventor, but are followers of John Queckett, Esq., of the Royal College of Surgeons. A Prize Medal was awarded to Mr. Topping.

BOURGOGNE (France, No. 434, p. 1199) has exhibited a case of microscopic objects prepared in the usual man-ner. They are mounted in Canada balsam, and comist of sections of wood, and entomological and other prepara-

tions, with a selection of salts to illustrate the polarization of light. The objects are well displayed, and carefully mounted. A Prize Medal was voted to M. Bourgogue, mounted. A Frames steam was voted to a, Dourgogne, Nonzarr (Prussia, No. 77, p. 1053), of Barth, has exhibited bis wonderful tracings on glass. The plan adopted thy him is to trace on glass ten separate bands at equal distance from each other, each band, being composed of parallel lines of some fraction of a Prussian inch apart,

in some they are might, and in others only whith of a The distance of these parallel lines form parts of a geometric series; thus-

0'001000 line. 0.000735 01000630 0.000240 0.089463 0.000397 0.000340 "

To see these lines at all it is necessary to use a micro-scope with a magnifying power of 100 diameters; the bands containing the fewest number of lines will then be visible. To distinguish the finer lines it will be necessary to use magnifying power of 3,000, and then the lines which are only most of an inch apart will be seen as perfectly traced as the coarser lines. Of all the tests yet found for object-glasses of high power these would seem to be the most valuable. These tracings have tended to confirm the undulating theory of light, the different colours of the spectrum being exhibited in the ruled spaces according to the separation of the lines; and in those cases where the distances between the lines are smaller than the lengths of the violet light waves, no colour is perceived; and it is stated that if inequalities amounting to '000002 line occur in some of the systems, stripes of another colour would appear in them, A. Prize Medal was awarded to Mr. Nobert.

LENDY (Sardinia, 60, p. 1304) has exhibited several dies or minute copies on silver and steel, of various de-These specimens of minute and excellent workmanship are produced by a machine invented, but not exhibited, by Mr. Lendy. By its means any model, however elaborate, varying in size from 7.87 inches to 0.039 inch in diameter, may be reduced to one-fiftcenth of its original size, a degree of unnuteness which renders the copies so reduced almost imperceptible to the naked On subjecting them, however, to examination by

the microscope, they are found to be composed of lines of all hut unparalleled delicacy and distinctuess. Mr. Lendy, who has been for many years engraver to the Royal Mist at Turin, has originated this ingenious invention, for the use of banks, mints, goldsmiths' companies, &c., with a view to the avoidance of counterfeits.

We may particularize the following dies or puncheons which are exhibited :-A royal crown engraved ou silver, and very elaborate, the lines within side being so fine, that a common hair covered five of them. The same design in relievo is also exhibited.

A ducal crown cugraved on silver, and surrounded by a gothic frieze, executed with sharpness and precision never before equalled in so minute an object. The same design in relievo is also exhibited.

A coat of arms containing a gothic "R," surrounded by a gothic frieze, and engraved on steel, 0 013 inch in diameter; in its execution it is as graceful as distinct. A similar design in relieve is also exhibited.

Another ducal crown on steel, equally good with the eceding, is exhibited, as also one in relievo.
Upon steel a capy of Mr. W. Wyon's medal (the design of which is a portrait of Her Mojesty, surrounded with the words Victoria, D.G. Britanniarum Regina F.D.), it is 0.06 inch in diameter, the original being

* See Pogrendorff's "Annalen" for 1846, and "Procerdings of the Royal Society," April 10, 1831,

1'8 inch in diameter. This is a most elaborate work,

and bears examination well by high powers.

This investion, apart from its great ingenuity and tha
perseverance by which it has been originated, promises to
be of great utility in reducing standard works with accoracy only exceeded by a degree of minuteness calculated to render any attempt at counterfeit next to impossible.

Object Glasses for Telescopes,

Simes (No. 741, pp. 475°, 476°, 477°) exhibits several achromatic object-glasses; viz., one of 9 inches aperture, two of 8 inches aperture, one of 6°9 inches apertore, and one of 4 inches aperture. The largest which is exhibited is entirely of English manufacture, and the discs, both of flint and crown, were made by Messrs. Chance, of Birmingham. In all the remaining glasses, the crown is of English—and the fiint of foreign—mannfacture. The

object-glasses are altogether the work of the exhibitor, and on examination were found to be good.

It is observable that the crown glass in all these speci-mens has a greenish hue, and Mr. Simms states, with reference to this particular, that he has found from expe-rience (as might be expected from the extinction of ona extreme, and consequent shortening of the total spec-trum), that there is less irrationality between this kind of erown glass and the denser kind of flint, than between erown gasst and the delier kind or hist, than octwicen the same specimens of flint and any other crown or plate glass that he has been able to procure. We understand Mr. Simm' practice in determining the corrections re-quired for achromatism consists in using that part of the spectrum which is included between the lines B and G; he finds, however, differences of small amount, sufficient to produce a sensible effect upon the results, between discs of glass sent to him at the same time, and which he supposes are prepared, if not at the same time, at least of

The following are the specific gravities, &c. of speci-ens of flint and crown glass manufactured by Messrs. Chance and Co., of Birmingham :-

Index of Index of Dispersive Kind of Glass. Refraction G. Forer B, to G. 3:583 1.6100 1.6336 0.036

Burnon (France, No. 443, p. 1199) has exhibited an achromatic glass 7.5 inches diameter and 10.8 feet focal length; the crown and flint glass for which were made by the late M. Guinard, of Paris, and the curves secondby the late M. Cathard, of Paris, and the curves according to the theory of Sir John Herschel, and is designed to show stars of the eleventh magnitude. It was not tried by the Jory on account of its tube being delayed at the Custom-house under a very heavy charge.

Solid Egr-pieces.

READE (No. 254A, p. 436) exhibits two solid eye-pieces They consist of three leases, the anterior and posterior being double convex of crown glass, and the intermediate one double concave of flint. The contact surfaces are cemented together, and consequently the action npon the rays of light is similar to that of a single lens. They are dicable to all astronomical instroments, micrometers, and microscopes, and also as a general magnifying power. p. 56.

The novelty of the solid eye-piece consists in its construc-tion, by which a large and flat field of view is obtained, together with the removal of spherical and chromatic aberration. These advantages are obtained by means of the great thickness of the flint lens, which is a perfectly

new feature in the construction of eye-pieces.

Sir David Brewster's achromatic sphere which he pre-Sir David Brewster's achromatic sphere which he pro-poses to use as an ohject glass for the microscope, approxi-mates to this form, but the field is not flat. The general mathematical expressions for the curres of the solid sye-piece have not as yet been fully worked out; but it may be stated as a rule for the practical optician, that the radii of the outer currey of the two coaver. lenses, must be in the proportion of the dispersive ratio of the crown and flint glass employed on each eye-piece, and the inner contact surface must be such as by experiment will perfect the achromatism. The solid eye-pieces ex-hibited have focal lengths of 0.5 inches and 0.75 inches, and it happens that while the eye-piece of shorter focal length is barely brought up to a flat field of view, the one of longer focal length is carried rather beyond, and is therefore slightly over corrected. These small errors are npon the whole satisfactory, inasmuch as they show that

truly flat field is attainal Sir David Brewster observes in his "Treatise on Optics," that "achromatic eye-pieces, where one lens only is wanted, may be composed of two or three lenses, exis wanted, may be compaced of two or three lumin, ex-netly on the same principle as object-planes; meth, in-deed, as the cemented triple object-plane made for the microscopy, which was described by the leve J.D. Breads as being an efficient eye-place for telescopes—in fact, the term both room of m vertice larged lears; has, the smallene of the field is an inneperalise objection to its obtained in the solid eye-place is nobly due to the thick-ness of the flint, which causes the image of the object-plane, where the eye in placed, but formed so near the glass, where the eye is passed, to be trained as every-piece that its diameter is seen under a considerable angle; and it is found that in the lower powers the diameter of the field of view is larger than in the ordinary negative eye-piece."

The positive eye-piece almost universally used, is known as llamsden's: the field is fint, which is requisite for a measuring instrument, but it is far from being free

The Astronomer Boyal states* that the positive eye-piece at present used is not achromatic, and cannot be made so; and considerable inconvenience is occasioued by

this defect, for when the object is not far from the centre of the field, the chromatic confusion is much greater than that produced by spherical aberration; since it varies as the distance from the centre, and in this confusion there is nothing to point out the centre of the coloured line. The new solid cye-piece is therefore looked npon as an important addition to the working apparatus of an astro-nomer, inasmoch as the great evil of chromatic confusion,

which prevents any accurate measurements at the ex-tremities of the field, does not here exist at all, but the webs of the micromater, though ever so distant, may be seen as fine black lines. The field of view is also free from illomination by false light; no light is lost, as in the usual construction by inner reflection from the sorfaces of the leuses,—and there is no formation of the false

of the lenses,—and there is no formation of the filter image or plots of plants, now of the high stars, which injures the best part of the field.

An examination of this eye-pices, as applied to a filter of the plants of the properties, as applied to a filter of the plants of the plants of the order of eye-pices applied to the same telescope, made by Mr. Glaither, extending over a period of three hours, fully impressed him with its superiority; the field of view was block, and the sars appeared as very prilip points. In block, and the sars appeared as very prilip points, in probably be found that in determining the colors of fault stars, these eye-peices may be of eventils service. The Jury awarded Mr. READE the Prize Medal.

* See "Cambridge Pl-ilosophical Transactions," vol. iil.

Optical Glass.

The disc, of 29 loches in diameter, exhibited by Mr. CHANCE (p. 477*) having undergone a partial examination by the Jury, it was considered that a satisfactory opinion could not be formed of it, owing to the irregularities in its surfaces, until it had undergone the operation of polishing, to as to give it a plane, or nearly plane figure. This operation having been performed by Mr. Ross, and that disc being reported by him fit for further examination, it was agreed to subject it to such ou Tuesday, that 9th of September 1851, for which day (it being considered by the Committee desirable to have the attendance of as many of the Jury as could be brought together) a Jury ons was issued, which was responded to by Professors Potter and Colladon, who attended with the Committee, consisting of Sir J. Herschel, Mr. Glaisher, and Professor Miller. Mr. Ross, Mr. Simms, and Mr. Bostems (the latter on the part of Mr. Chance) were also present nt the axamination

The dimensions of the disc were as fallows:-Largest diameter . . . 294 inches. . . . 29 Shortest

Its weight was stated to be somewhere about 200 lbs, The specific gravity about 3 56 ... 3 58. The surfaces were highly polished and brought to a figure very slightly deviating from true planes, so that no deceptive

appearance of striction could possibly arise from irregularities in their surfaces The disc was first examined by inspection through faces cut upon its edges. These faces had not been repolished, or brought to a true figure; so that nothing could be gathered from this examination, but that no

offensive strine were seen through them. The state of the disc, as to tension from imperfect annealing, was then tried by passing polarized light through it at right angles and at obliquities, and analysing the emergent beam by tourmalines and Nichol prisms. It was found to be very remarkably free from indications of tension, only a feeble gleam of whitish light becoming perceptible on some portions of the edges, which might have arisen from the heat of the hands of the persons

employed to lift and keep it in position.

It was then placed on edge, and tested by looking very obliquely through it at objects offering broad lights and During this examination a group of strine became visible at a spot whose position on the glass was marked, and to which and its near neighbourhood they seemed to be limited

To true the limits of this group, and to subject the whole due to a more rigorous and delicate sentiny, it was set upright on a table; the room (the Indian tent) darkened, a candle placed 7 or 8 feet behind the dise, and a convex lens of about 5 feet focus and 6 inches diam of extremely pure glass, held between the candle and the leas close to the latter. The eye of the observer being placed before the disc in the place of the image of the camile, so as to cover the lens with a glare of light; strim, it is well known, become distinctly apparent, if existing, in any part of the disc so covered,

Every part of the disc in succession, beginning from the centre, and proceeding outward in radii, was thus earefully examined for strine. With the exception of a hair or thread, perfectly definite, and of a looped form, thus, near the centre, and not of the smallest im-

portance in an optical point of view, and a few other trifling threads, originating apparently in minute sandgraios, in various points, and also utterly inoffensive, no appearance of strice whatever could be discerned over any part of the disc, but at and in the immediate neighbour-

ood of the place marked, No bubbles of any consequence were noticed in this exa-

ntion, or on ocular impection Attention being concentrated on the group of strice thus pointed out, it was found to occupy a space (at its utmost extent) of 6½ inches in length and 2½ inches in brealth, beginning at about 1½ inches from the edge, and having its longer dimension directed towards the centre. The

whole of this space was hy no means equally affected, and the most objectionable portion was much more limited. This was situated not far from the middle of the space in question; and it was proved decisively that the seat of the worst portion (or nucleus) of the group was almost close to one of the surfaces, by the test of was amount evous to one of the surfaces, by the test of parallax, viz., hy placing a mark on the surface next the eye on the apparent place of the nucleus, and then tilting the disc right and left. One side (A) being towards the eye, the mark and nucleus remained coincident; and on reversing the disc, and bringing the other side B negrest the eye, and making a fresh mark (effacing the former), they coincided only when the visual ray passed perpendicularly through the disc, the nucleus passing paralhe-tically behind the mark, from side to side, on inclining the disc.

As the disc would have to be worked into a concave or convexo-concave lens, by which its thickness in the centre would be reduced at least an inch, there is little doubt, therefore, that hy acting on that surface near which the nucleus is situated, it, and much of the neighbouring strim, which are evidently connected with it, would be ground out. Such is the decided opinion of In that case, as the whole area occupied by Mr Ross the strinted region does not exceed 0.019, or less than one-fiftieth of the total surface of the glass, it might very one-interts of the total surface of the gains, it might very reasonably be expected that, if worked into an object-glass, the mass of good light would so far overpower the injurious effect of what sirise might remain, as to give a rery satisfactory result, and that for many purposes of high astronomy it might prove extremely efficient. On the other hand, if it should be resolved to sacrifice

the defective portion, or so much of it as to leave but a very riffing part of a comparatively inoffensive region still encroaching on the edge (suppose a spot of an inch diameter), it would be practicable to cut out from the whole disc a smaller one of 22 inches (29 - 14 - 54) dinmeter, apparently quite perfect in every other part, and of 2.2 inches in thickness is superfinous, it might be found practicable, by eautiously heating the glass to the softcuing point, and applying presence, to extend it in surface whilst reducing its thickness to 22-29ths of its present amount. Supposing this operation successfully performed, and that in the manipulation some portion of the good glass adjacent to manupulation some portion of the good guess agreed to the strinted part being retained could be pressed inwards, so as to drive out the small strinted corner, a disc of 25 inches diameter, of apparently perfect ffint glass, would he produced.

he great object-glasses of Pulkowa, and of New Cambridge in the United States, do not exceed 16 Inches, Compared to this, a 25-inch, or even a 22-inch object lass would be as great a stride in advance, as the glass would be us great a stress in manager. Pulkowa leus is beyond the largest achromatics proviously constructed,

On these grounds the Committee have had no hesits tion in recommending that a Council Medal be given to Messrs. Charce for this disc. They desire it to be clearly understood, however, that no examination to which a disc of glass waverled can be subjected, will afford more than a reasonable probability that a telescope worked from it shall turn out perfect; since, independ-ently of peculiarities in the glass which this kind of examinntion may fail in detecting (though no better has yet heen devised), the perfection of the resulting instrument will still be dependent on that of the crown less and of the optical workmanship,

MARS (France, No. 656, p. 1209) has exhibited specimens of a new kied of glass; the basis of which is the oxide of zine, a certain quantity of borax, a borneic neid being added, to give the glossy character for which the remarkable, combined with an easier fusibility. As a material in the arts, the Jury lave so further concern with this glass, than as regards its probable utility in the construction of telescopes, prisms, and other entiral apparatus, for which it extreme limpidity and total freedom from colour, and, so far as appears, from veins and strise, seem eminently to fit it, and which have induced them to propose its being rewarded with a Medal. The low dispersive power of the zine compounds, points to its use as replacing the crown glass in achromatic telescopes, Suppose it should be found practicable (and the experiment is recommended to the attention of artists, as one in which, when tried on a very small scale, some success has actually been obtained) to form colourless and uniform glasses in which fluorine enters as a distinguished ingredieut, in combination with silics, alumina, or other materials; the combination of such glass, as a convex lens, with this new material of Mr. Maes, or with ordinary crown glass, as a concave, might be expected to produce achromatic object-glasses of a very perfect description, The coloured dispersion to be removed, being much less than that of erown glass, owing to the peculiarity of the fluorie compounds, which beset the manufacture of flint glass, arising from the intense solvent power of the oxide of lead on the crueibles, and give rise to strin and veius, would be evaded. Mr. Maës, besides two prisms of his new glass, of the most limpid purity and perfect freedom from veins or strine, has exhibited two discs of 4½ and 7 inches in diameter, prepared for optical use. In an examination, through faces cut on their edges, no veins or strie were detected, and, consequently, should there arise no objection to this material, either in point of durability or facility of working, it will probably prove very valuable for the use of the optician. Some small astronomical leoses, in which ainc is substituted for crown glass, are also shown. Its refractive index is 3°285, and its dis-

persive ratio, as compared with a flint glass of specific gravity, is as 3.55, to 0.6502. It has been long a theorem in every treatise on optics, that the achromatic union of the whole spectrum cannot be accomplished by any combination of dispersive media, and that two media of different dispersions enable us to unite but two rays procisely, the rest only approximating, leaving two masses of uncemented colour, the one cooverging to a longer, the other to a shorter focus three media, admits of the exact union of three rays at different points of the spectrum, and a very much greater approximation to union among all the rest, provided their scales of action on the different rays of the spectrum differ sufficiently. In this point of view, the new glass, whose dispersive action on the spectrum, from the introduction of a new metallie oxide, may very reasonably be expected to differ from those of the crown and fine glass, will, perhaps, become available in this third medium, so long a desideratum in optics; and its use may open a new field in the theory of the construction of telescopes. Should It prove (owing to the boracic acid it contains) less durable, or more open to atmospheric corrosion than the other media, its place in a compound lens will be intermediate, as a defence from air or moisture, and one of the conditions of the structure may be that of a perfect coincidence of one or of both its surfaces, with those of the adjacent lenses, to allow of cemeuting them. A Prize Medal was awarded

DAGUET (Switzerland, No. 75, p. 1271) has exhibited discs of flint glass of 15½, 12½, 10½, 9½, 7½, 7, 6½, and 4½ inches in diameter respectively. On examination, by inches in diameter respectively. On examination, it chords and diameters, they were all found to be good string were suspected to exist in the largest; hut, if so, it was in one diameter only, and but to small amount. A discof crown-glass, of 7 inches diameter, and one of 42 inches, were examined, and found to be good; another, of 65 inches, was less perfect. The specific gravity of the flint was stated to be nearly 4, and that of the crown to be from 3.5 to 3.6.

Mr. Daguet, by a process of his own, gives to fliot-gluss a degree of hardness not attained by any other manufacturer; his glass, porticularly the fliot, is in general use among all the best opticians, heing distinguished both by its homogeneousness and its peculiar property of resisting all decomposition by the action of air. The Council Medal was awarded to Mr. Daguet,

spherical aberration, and give a true view on their whole surface: also long leases, with the axes parallel, equally true throughout; they are useful in photographic regis-tration of changes in the position of magnets, &c., as adopted by Mr. Brooke.
M. Beyersé also exhibits lenses ground on curves of

M. Beyerie and examine muses ground on the conditions of different foci, &c.; also many achromatic lenses of short focus. The working of these reflects high credit upon M. Beyerlé, and the Prize Medal was awarded to him. Jamin (France, No. 548, p. 1204) exhibits a fine

assortment of prisms, chiefly crown; a large flint disc, and plane and concave reflectors, mounted on brass swing frames, of large dimensions. Honourable Mention was made of M. Jamin

Berraun, Jun. (France, No. 1549, p. 1251) has exhi-hited some of the finest possible Nicholl's prisons; some slices of crystals, prepared to show that, in certain crystallized bodies, heat is unequally transmitted in different directions; with many other specimeus of most difficult, yet beautifully cut prisms, reflecting the highest credit upon the maker. The Prize Medal was awarded to

BUBON (France, No. 443, p. 1199) has exhibited various prisms,

Lighthouses

CHANCE (Class XXIV., p. 477, Class X.) has exhibited a design for a lighthouse, consisting of a dioptric apparatus of the first order, and constructed with revolving leases and catadioptric zones.

This apparatus combines the principles upon which the fixed and revolving dioptric lights of French were constructed, with an improved method of reflection, by which the use of motal reflectors is entirely suner-

In the fixed dioptric light of Fresnel, the flame is placed in the centre of the apparatus, and within a eylindric refractor of glass, of a vertical refracting power, the breadth and height of the strip of light emitted by it, being dependent upon the size of the flame and the height of the reflector itself; above and below is placed a series of reflecting prismatic riugs, or zones, for collecting the upper and lower divergent rays, which, falling upon the inner side of the zone, are refracted, pass upon the lancer size of the zone, are retracted, pass through the second side, where they suffer total re-flection, and, passing out on the outer side of the zone, are again refracted. The effect of these zones is to lengthen the vertical strip of light, the size of which is dependent upon the breadth of his frame and the height dependent upon the breadth of his frame and the region. of the apparatus.

The system adopted by Fresnel, in his revolving dioptric lighthouse, is open to some objections. A largo flame is placed in the centre of a revolving frame, which carries a number of leuses, on a large scale and of various cursatures, for the avoidance of spherical aberration. With the view of collecting the divergent rays above the flume, an arrangement of lenses and silvered mirrors is placed immediately over it. By this compound arrange-ment the simply revolving character of the apparatus is destroyed, as, in addition to the revolving tlash, a ver-tical and fixed light is at all times seen; added to which a great loss of light must be sustained from the use of metallic reflectors.

The lighthouse constructed by Mr. Chance may be described as Fresne's revolving light, rendered holophotal. It is divided into three compartments, the upper

and lower of which are composed respectively of thirteen and six entadioptric zones, which produce the vertical strip of light extending the whole length of the apparatus, and is similar to that described as Freszel's fixed dioptric The central or cutoptric compartment consists of light. eight lenses of three feet focal length, each of which is the centre of a series of eleven concentric prismanio rings, designed to produce the rame refractive effect as a solid less of equal size. These compound lesses are mounted upon a revolving frame, and transmit horizontal flashes of light as they successively rotate. The motion is Lenses and Prisms.

Bernauds (France), 70,765, p.1217) exhibits many lenses ground with cylindrical surfaces; they are free from last there are eight lenses, a flash of light is transmittened to the lense, a flash of light is transmittened to the lense, a flash of light is transmittened to the lense, a flash of light is transmittened to the lense, a flash of light is transmittened to the lense and light is transmittened to the frame by a clock movement, and performs one revolution in four minutes of the lense and light is transmittened to the frame by a clock movement, and performs one revolution in four minutes of the lense and light is transmittened to the frame by a clock movement, and performs one revolution in four minutes of the lense and light is transmittened to the light is transmittene every thirty seconds to the horizon. The system of a fixed light, varied by flashes from prisms, originated

with Fresnel.

The apparatus is lighted by an Argand lamp, with four concentrio wicks: it is provided with four sizes of hurners, the largest of which is 3½ inches, and the smallest 1 6 inch in diameter, and is stated to consume I pound 10 ounces of oil per honr; carcel oil being employed.

The interior edges of the framework, carrying the

catadioptric zones, are silvered; the workmanship is not characterized by any great degree of finish; a fact in its favour, as any great degree of finish, or adoption of ornament, would involve an increased ontlay of capital

ornament, would involve an increased outny or capital without compensating advantages. The glass of which the apparatus is manufactured is ark and of a greenish colour; this we are informed is due to its having been subjected, in melting, to a very high temperature, with a view of draining off the alkali, which, hy rendering it dryer and harder, would prevent the exiding of moisture from the surface, in defect to which glass is liable when exposed to the air; it is, buwever, bable that the colour will have no injurious effect, as it is known that such tinge does not affect the transmission of light. The presence of strise, which are

ubservable in many points, will, by scattering the rays, cause a loss of light to some amount,
WILKING (Class VII., No. 157, pp. 326—328) has exhibited a revolving catadioptric apparatus for a light-

house of the first class,

This, also, is constructed upon the holophotal system and does not differ very materially from that exhibited by Chance. For the moveable cylindrical lenses, is substituted a single revolving eylinder composed of four lenses, alternated with an equal number of fixed ones, according to the succession of flashes to be produced during each revolution. A new arrangement is also introduced, whereby the friction rollers which revolve introduced, whereby the friction rollers which revolve on two parallel planes, may be so fitted on an iron axis with regolating seriess, that, when one part of the plate becomes worn, they may be adjusted to another part. The glass, though white in colour, is not more free from stris than that exhibited by Mr. Chance, and though great finish and ornament are discernible in the manufacture of the apparatus, these would seem to be rather objectionable than otherwise. For a detailed description, see Illustrated Catalogue, Class VII. The Jury make Hunograble Mention of this light-

Physical Optics.

Dunosq-Soletl (France, No. 1197, p. 1235) has exhibited Silberman's heliostat. The principle of this instrument is quite different from that of S'gravesaudes, which is that of making the perpendiculars to the reflocting plane, describe an oblique cone. In the reflecting plane, describe an oblique cone. In the instruments exhibited, the reflector, by a peculiar gimbal suspension, is always kept equally inclined to two axes, suspension, is aways keyn expany incurses to two sex-one of which is fixed, and directed towards the line which the reflected ray is to take; the other is kept by a clock motion always parallel to the sun's direction, the plane of the reflected ray being by the same gimbal

plane of the reflected ray being by the same gimbal suspension, kept perpendicular to the plane in which both these axes lie; thus the incident ray parallel to the one will be reflected parallel to the other.* Demony-Solent (No. 1197, p. 1935) has also exhibited a saccharometer. A double gauge is formed by a rotato-polarizing plate of quarts and Icedand part, of which two semicircles, juxtaposed, and viewed through a telescope of about double magnifying power, are brought to exact coincidence of colour, by turning the spar. In this situation, the images are viewed through an empty tabe, closed at either end with glass, and of a given length. The saccharine solution is passed in, and the quality of colour disturbed: the semicircles no longer match: they are then re-adjusted by sliding one upon the other two achromatized prisms of Iceland spar acting against each other, so as to leave their difference of thickness outstanding, the amount being estimated in parts of a finely divided scale, which is graduated so as to show, by inspection, the saccharine matter present, beautiful and delicate instrument, carefully executed and well-finished.

Dunosq-Soleri. (No. 1197, p. 1235) has also exhibited Bravais' kaloscope, for the exhibition of all the phenomenas connected with halos, parhelions, &c. This beantiful instrument consists of a clock-movement for the purpose of giving a rapid revolution to a vertical axis; two glass prisms (one hollow for the reception of water); a quadrangular prism, and a small arm carrying a mirror, all adapted for mounting on the vertical axis; two opaque plates of glass for the purpose of obscuring one or two sides of the prisms, as necessary, and a plate of glass monuted. To produce a representation of the parhelion, it is necessary to place a candle in a darkened chamber, on a level with, and 10 or 12 feet distant from, the glass prism on its axis of rotation, the prism having two sides covered. On looking in a horizontal direction, the parhelion circle will become visible. By obscuring one side of the prism, only three horizontal lines are seen; two being formed from the exterior and one from interior reflection.

To produce an imitation of the white parhelion, the candle is placed in the same position, and two sides of the prism are again darkened; when, on looking at the parliction circle, at a distance of 120° from the candle,

the white one will be perceived.

Colonred parhelions may be exhibited by means of the prism of water, viewed at an angle of 20° ur 25°. One side of the prism being obscured, the colonred parhelion, red on the side near the candle, with a white train pro-longed to 15° or 20°, will be seen.

longed to 15° or 30°, will be seen.

To imitate coloured pathelious, formed at a distance
of 98° from the sun, the arrangements are the same. By
obscuring the prism, and looking at the distance of 98°
from the candic, a coloured spot will be observed, red on
the side opposite to the candic, and less bright thum the parhelion.

The circumzenithal tangent of the arc may be imitated

hy means uf the prism of water, the candle being lowered by means ut the prasm of water, the calddle being lowered from its original position, and two sides of the prism darkeased; on placing the eye in a proper position, the image will then appear reducted upon the ceiling. Several changes may be produced by simply turning the prism. The circumstenithal are may be produced by the above arrangement, the position of the eye only being altered

To imitate the anthelion, it is necessary to make use of the quadrangular prism; its large transparent surface is turned towards the observer, and the candle placed a little above the prism, at the distance of six or eight feet from it. A small eircular mirror is then so placed that its centra is on a level with the top of the prism. Tha eye, being situated behind the prism, will perceive a laminous circle described beneath its edge. If a little slip of paper be placed beneath, it will be perceived more distinctly without moving. By moving the position of the eye, several distinct phenomena will become visible. There are means of adjusting the apparatus, to render that image for a time permanently fixed. Other phenomena besides those detailed can be shown by this instrument, and great merit is due to M. Bravais, the inventor.

bosq-Soleil, besides these, exhibits a very great of delicately constructed philosophical instruvariety of delicately constructed philosophical variety of deficielty constructed philosophical instru-ments, for exhibiting the phenomena of polarized light and other physical experiments of the property of the Arago's apporatus for exhibiting the interference of polarized light; Pressel's screw for polarizing glass by compression; Ibilialet's gonimeter, Hewster's steroscope, &c. 1 M. Dubous-Soleil also exhibits an apparatus, invented by hisself, for fixing the charcoal points for electric light.

A Council Medal was awarded to M. Dubosq-Soleil.

Spectacles and Opera Glasses It is with regret we observe that exhibitors of spectacles in the British portion of the Exhibition have done nothing

^{*} See " Comptes Rendus de l'Académie," 1843, tome xvii., p. 1319.

mere than exhibit a collection of shop years, and have matter of little memoric. They have view with our matter is meaning spectricles in the fixes and most more elicites than my which have before been made. The spectra of the spectra of the spectra of the Tollevie is the every wide have been been been been started with the spectra of the spectra spectra of the spectra of the spectra of the spectra posture as of the spectra of the spectr

incident upon the use or spectanes. Upon spectacles, as constructed by M. Henri, we have no objection to report, combining as they do the work of the opticins with a knowledge of optics; but we emnot consider we are called upon to report apon spectacle-frames, or articles which have swidently been manufactared and exhibited with a purely commercial whew. BOWLEY (N. 250, p. 439) has exhibited spectacles of

BOWLEY (NO. 299, 4-39) has exhibited speciacles of various kinds, chiefly remarkable for their durability of mounting, both as regards material and construction, soma being of no greater weight than 11 grains; the whole weight, including glasses, not amounting to more than 2 penoyweights. The steel frames of these has tresemble hair lines, and are imperceptible at no great distance.

Waarsa (No. 273, p. 438) has exhibited several pairs of spectacles, many of them distinguished by a mounting of extreme lightness; also a steel hand frame, to be adjusted before the eyes, without pressing upon the none. Baararawara (No. 283, p. 439) has exhibited several ventilating eye-bandes, designed to allow a carrent of air white the contract of the contract

Catabugar Buvruras (No. 29.9, p. 436) has exhibited several pairs of datale steel-framed speciates, designed to combine lightness with durability, and spectates for to avaious purposes. These, as well as everything exhibited by Mesrs, Chadburn, are remarkable for extreme chapses, and in this respect they deserve Honcombile Mention. Batury (No. 273, p. 438) has exhibited various spectacles, in monature of gold and silver,

HYANS (No. 278, p. 438) exhibits a solid piece of glass of a conical shape, or rather of the form of a finatrum of a cone, ground at the base or larger ead to a convex surface, and at the smoller end to a concave surface, intended for concentrations.

intended for opera-glasses.

Dixir (No. 271, p. 438) has exhibited a variety of spectacles, some of them remarkable for their lightness, a variety of eye-glasser, and several binocular opera-glasses.

CLARR (No. 276, p. 438) has exhibited spectacles adapted for use, if required, as an opera-glass. ELLIOTT and Soss (No. 370, pp. 443, 444) exhibit specimens of blue steel and gold spectacles of a very light and flexible kind; also gold hand-spectacles, intended for use with oue hand, and various specimeus of opera-glasses.

Hoave, Thornythwaite, and Wood (No. 220, p. 434), exhibit Smee's optometer, for ascertaining the refractory humours of the eye, and the required focus of spectacle glasses.

House, (No. 280, p. 422) has arbibited various hinds

glusses.

HRAHAM (No. 289, p. 439) has exhibited various kiuds
of spectacles.

CALLAGRIAN (No. 268, p. 437) a pair of steel spectacles.
SOLOMON (No. 288, p. 437) a pair of eye-protectors.
WHITEROEXI (No. 280, p. 438) various spectacles; a
pair for sketching, mousted without a rim to prevent
obstructing the vision.

YEATES (No. 532, p. 446), of Dublin, spectacles of the ordinary kind.

within y sing.

Havan (Prance, No. 262, p. 1189) has exhibited several blade of supervised spectuales, for correcting the defects of straight of the straight or left as will. They are designed for the cure of squinting, either converging or diverging. Spectacles for both requirements are exhibited.

M. Heari has also exhibited spectacles for preserving the eyo-sight (conserves gardes-rues) designed for the use of persoos suffering from weak eyes, ophthalmin, &c., and particularly adapted for the use of those who work much at sight by artificial light.

With the skill of the optican, M. Heari has combined the knowledge of the oralist, and great praise is due to him for the inprovements he has made in spectacles adapted to peculiar states of the eye; he has the further ment of being the only exhibitor of such spectacles in the Exhibition. The Jury considered him well worthy of Honouruble Methon.

men Andrews and Section of the American Section of the American Section of the Control of the Section of the Control of the Section of the Control of the Section of the Se

an general, owing to the reason before mentioned.

All Poullet considers that he has made spectacles which always preserve the visual ray in the courte of the glass; he has also exhibited metallic worst spectacles for the admission of air to the eyer, which subdue the light and serve as a screen against dust, insects, &c., or any curraneous rebasence which might be highrous to the

cyc.
LEBRUX (France, No. 298, p. 1191), exhibits many very cheap spectacles and opera-glasses.
PRUMENT (France, No. 1412, p. 1243) exhibits a fine

collection of opera-glasses, none of which have large object-planses. Braco (France, No. 443, p. 1199) has calibited a number of opera-glasses, both single and double, of which the mountings are of various materials, such as cunnel,

ivory, tortoiseshell, &c.

Breuz (Frasaia, No. 89, p. 1053) exhibits various
spectacles, differently mounted; single and double operaglasses, leases, &c.

Latinz (Belgium, No. 184, p. 1157) has exhibited

Harding Chronical Co. 1, p. 11-77 and exhibited warnous pairs of spectacles.

Photographic Glass.

Messes, Chance and Co. (Class XXIV., No. 22, pp. 700, 701) have exhibited flint glass, in disea and in plates, adapted for the construction of object-glasses for Duguer-rootype and Tailbotype apparatus and camerus. Of these

discs one is as large as 20 inches in diameter, and there are some thin plates of the same kind of glass for catting up.

The density of this glass is 3'20; the index of its

refractive power is 1500, Branox (France, No. 443, p. 1499) has exhibited a collection of glasses of 6, 8, 10, and 12 inches diameter, for dissolving views.

Photography. Rapid as have been the discoveries connected with Photography, and great as are the improvements it has received since the invention of M. Dagnerre, there is yet much to be done to enable it to rank amongst the sciences of the age. It holds a place at present intermediate between an art and a science, a position eminently favourable to development in either direction. Its pursuit, as an elegant and most extensively useful art, affords a strong motive for isquiry and experiment in the improvement of its processes; in the course of which, an infinity of facts, new and nnexpected, come forward, every one of which may tern out to be the embediment of some pregwhich may turn out to construct the smallest minution of manipulation on which it is found that success or failure in the production of artistic effect depends, may, if duly observed and reasoned on, afford indications, linking together the known and the unknown is optical science, and tending to bring these mysterious operations of light within the sale of exact reasoning. On the other hand, science is too much in the habit of repaying to art, with interest, every assistance of that nature, to leave room for doubt of similar results in this instance, when once the principles of operative chemistry shall have assumed a definite form and subjective connexion. It is this which affirds us full assurance that Photography is yet in its infancy, and that all which has been hitherto accomplished-marvellous and exquisite though it be, is as nothing to what will be performed when the veil shall be removed, which, for the present, obscures its true scientific principles. In this point of view the photographic study of the prismatic spectrum per se, apart from all artistic combinations and coloured media, cannot be too strongly recommended to experimenters, and we lament to observe only one instance, in the whole Exhibition (that of M. Clandet) in which this study appears to here been in any way followed up, so as to afford exhibitable results. Mr. Ross is understood, also, to construct the object-glasses of his photographic cameras, with especial reference to the excessive development of the actinic spectrum beyond the luminous one, in the direction of the violet rays. When hromine is used in the preparation of the plate or tablet, it may be questioued how far this is really an improvement? Should means be discovered of truly representing the celours of objects, and limiting the action to the luminous ray, the con ditions of achromaticity for the photographic camera will

The fine cellection of Pholographs now exhibited will, yet call make the the descrement of the boundle str., by decided now, by the constraint of the boundle str., by that which it is not made in the constraint of the constraint

be the same as for the telescope,

ees of the present day is most striking. It is not the object of this report to trace the history of liveations, nor to decide on elaims of priority, especially in relation to a subject which has received accessions from such innumerable guarters, and called late action

the skill of so many emineut chemists and photologists of every nation. Suffice it to say, that, after the introduction of M. Chudet's accelerating process by the appli-cation of chloride of iodine and chloride of bromiue (an invention which he liberally gave to the public through the medium of the Royal Society and the Academic des Sciences); the Daguerreotype process, as publicly practised, became reduced to some system, and two Daguerreo-type establishments were formed in London. The portraits taken, at this time, were, however, deficient in expression; but in spite of all deficiencies, the receipts of these establishments several times amounted to 60% in one day. At a somewhat later period that remarkable variety of the Talbotype process, designated by its inventor by the name of "Kalotype" was also publicly employed for the production of portraits by Mr. Callen: the artistic effect in these representations was susceptible of being much heightened by the hrush and the defects of expression might be removed, and the likeness in consequence greatly

improved by one or more subsequent sittings.

M. Claudet, who, from the earliest time of the Ducuerrian invention, displayed great genius and ability in perfeeting the various processes, first perceived the necessity of aiding the artistic effect of his representations by subsi-diary adjuncts of a different kind. He it was who first praaury any anomato of a different kind. He it was who first practiced the placing of painted back-grounds behind the persons whose portraits were to be taken. Thus an infinite variety of scene might be afforded by the operator simply providing himself with a few subjects skilfully adapted to the requirements of the occasion. To him also we owe that extremely pleasing adaptation of mechanical adjustments for bringing many miniature representations of the same individual under different aspects, to be impressed in regular compartments of the same plate and framed together,—of which we find specimens exhibited in his collection,

collection.

It is not necessary to detail, step by step, the successive improvements in the different processes and apparatus for Daguerrotypic Photography, though we may mention that to the exertions of Messre Claudet, Gandin, Fireon, and Draper, the public are indebted for many improvement. To M. Firean is due the reproduction of the proofs of electrotype; also a new process for cugraving

proofs of electrotype; also a new process for cugraving the Daguerrain image, and of preserving that image from destruction by gilding the surface.

The Exhibition presents many fine calotypes, or as they are sometimes called in the Catalogue "sun-pictures," for the production of which the preparations of Mr. Talmor hold the first rank. M. Bayraparations of been colobrated for his achievements in this line, and has contributed many splendid proofs, obtained on various sensitive papers. Mr. Talbot has, himself, exhibited nothing; but many of his productions will be recognized among those exhibi by HENNEMAN and MALONE, as adapted to the practical wants of travellers, collectors, &c. This branch of the wants of travelers, consectors, &c. Inst branch of the art offers inestimable advantages, viz.: 1st, That the papers may be prepared at leisure, some time before an occasion for using them arrives, 2ndly, That when pressed and fazed, they may be carried without follury in a port-folio, like other drawings: 3ndly, That from one good negative original, any number of positive copies may be taken, to the extent, indeed, of two or three hundred taken, to the extent, indeed, of two or three hundred copies in a raing day, as proved by the practice of M. Everand Blanquart (France, No. 1551), and supplied EVERLARD BILANGUARY (FFARCE, No. 1851), and supplied to the public at a cheap rate; 4thly, That they may be wholly obliterated so as to reduce them apparently to the original condition of white paper, and carried about in that state for an indefinite period, though susceptible of revival at any instant. Considering it probable that the following communication, addressed by M. Arago to the Academy of Communication, addressed by M. Arago to Academy of Sciences, on the granting a national recom-pense to M. Daguerro, may be as useful to a portion of the public, now, as then; we subjoin it in the words of M. Arago himself:—

M. Ango himself:—
"A short time after the law was voted, granting a mitional recompants to M. Daguerre, some opinions, have a minional recompant to M. Daguerre, some opinions, have a minional profite of the public, which rendered it and August 1800, and have a minion to be estimated in respect to art only, but to the public, when the public of the public with rendered in the public was a minimal profit. Specific most to be estimated in respect to art only, but to the public with the public of the public was a minimal profit. Specific most to be estimated in respect to art only, but to the public with the public of the public was a public or the p

valuable subjects for investigation which it presented in reference to the physical sciences Without further remark, we proceed to the discussion of the Potographs exhibited

Daguerreotype Pictures,

CLAUDET (No. 296, pp. 440, 441) has exhibited a large collection of daguerreotype portraits, both plain and coloured. Amongst various excellences of which they are possessed, we may particularly mention that of their non-inverting. This is a great improvement, and by it M. Chaudet has annulled the superiority which the sun-pictures have so long possessed, in this particular, over the daguerreotypes

On examining the uncoloured specimens exhibited by Claudet, it will be found that they are distinguished by orristic arrangement, indicious distribution of light and shade, and great elearoess of definition. The general tone is good,—M. Claudet having uniformly avoided violent contrasts of light and shade; a circumstance to which much of his success may be attributed. In this collection are several female portraits in white draperies. which pictures deserve commendation for their beauty of detail and freedom from solarization. Many of the above remarks apply, equally, to the colonred specimens, most of which are portraits, and are distinguished by careful and harmonious colouring, the focus having been so jud eiously selected, and most of them present an artistic and natural appearance, seldom hitherto obtained by Daguerreoty pists.

Photography may be said to be too faithfully exact in its results, for the purposes of art; detailing, as it does, the accessories in the back ground and the main object of the group with equal fidelity. When blending colour with photographic works, or in visibly uniting art and science on the same plate, the operator should be possessed of knowledge and feeling sufficient to know the proportions in which art and accence should interminate so as to be subservient to each other; in this knowledge, which is cliefly dependent upon the proper focal adjust-ments of the picture, M. Claudet excels; and the admi-rable manner is which he sacrifices the details, afforded him by science, to the requirements of his subject, is the result of long and laborious investigation.

An uncoloured deguerreotype by Chudet is worthy of particular mention; it represents various articles of verth, pictures, &c., grouped together: the perfect focus of each part and general relief of the whole prove it to be a suceessful application of his focimeter.

M. Claudet also exhibits the dynaetimometer* and focimeter. He also exhibits the effects of the spectram on the daguerreotype plate, as prepared by him, and a variety of curious and instructive specimens illustrative of the different refrangible rays. The Council Medal was awarded to M. Claudet

KILBURN (No. 294, p. 440) has exhibited a case cou taining several carefully-selected specimens of coloured daguerreotypes. The subjects of these pictures are confined to groups of figures of small size, and are very brilliant and elaborate in their details,-too much so for artistic effect. For novelty of design we may mention a small picture of the interior of a room, including a whole length portrait of Jenny Lind: beside, and near her, is a large mirror, in which the figure is reflected. That the reflection in the glass is equally perfect with the original is the point worthy of remark and commendation. To-wards the centre of this case is a plain deguerrotype portrait of the Queen. The finish and execution of this little work are very great. The Jury awarded a Prize Medal to Mr. Kilhuro

MAYALL (No. 291, pp. 439, 440) has exhibited in this department in large collection of dagnerreotypes, uncoloured. They are characterized by great contrasts of

* The reader is referred for an account of the dynactimometer to the "Reports of the British Association," August 1850, and to the "Philosophical Magazine," June 1831, and for the focimeter, to the "British Association," Reports," September 1849, and "Philosophical Magazine," light and shade, disposed in large masses. Among the subjects exhibited are four tableaux from the "Soldier's Dream," and several groups from Nature, variously arranged. Mr. Mayall's strong and broad masses of light ranged. Mr. mayan a strong mus mrout masses on ugar and shade are better adapted for landscape scenery, of which the "Falls of Ningara" is a favourable specimen, His "Bacchus and Ariaduc," 24 in, by 15 in., is, perhaps, the largest dayserrostype which has yet been executed. The difficulty of daily preparing so great a surface must be extreme. He has also exhibited a crayon danuerreotype, produced by a process of his own invention. Beard (No. 202, p. 440) has exhibited a case of dagner-reotypes, some of them enamelled, according to a process

invented by himself.+ vented by numsex.7 Labocitic (Class XXX., No. 252, p. 837) has exhibited three small daguerreotypes: two are coloured: the third,

a group of statuary, is good, VOIGTLANDER and EVANS (Class XXX., No. 254, p. 837), Knightshridge, have exhibited coloured daguer-

Of the remaining exhibitors in England, - Garrerrus and Le Beau (No. 404, p. 453) have exhibited a case of and Le Brau (No. 404, p. 433) have exhibited a case of dageerrectype ministrures, colonred, Paine (No. 225, p. 440), n series of photographic pictures, intended to allow the processes of the art. Tyras: (No. 239, p. 442), coloured daguerrectype portraits; and Channocx (Class XXx, No. 227, p. 534), photographic copies of various engravings.

On examining the daguerreotypes contributed by the United States, every observer must be struck with their beauty of execution, the broad and well-toned masses of light and shade, and the total absence of all gare, which render them so superior to many works of this class. Were we to particularize the individual excellences of the pictures exhibited, we should far exceed the limits of space to which we are necessarily confined. Where all is good, it follows that remarks must be restricted to peculiar excellence alone

Hefore speaking of the several works exhibited, it is hut fair to our own photographists to observe, that much as America has produced, and excellent as are her works, every effort has been seconded by all that elimate and the purest of atmospheres could effect; and when we consider how important an element of the process is a clear we must be careful not to overrate that superiority of execution which America certainly menifests.

LAWRENCE, of New York (United States, No. 151, p. 1446), has exhibited several dagaerreotype portraits, uncoloured. They are remarkable for clear definition and general excellence of execution. In this series two large portraits of General J. Watson and W. Bryant, Esq., each of which measures 124 in, by 104 in., deserve particular commendation. Notwithstanding their large particular commendation. Notwithstanding their large size, they are, throughout, perfectly in focus, and are beautifully finished in all their details. These are two of the best pictures in the American collection. A portrait of General J. W. Wells, and of a lady in a black silk dress, of a smaller size, are also remarkable. A Concil Medal was awarded to Mr. Lawrence by the Jury, but

not confirmed by the Group.

Baady (United States, No. 137, p. 1441) has exhibited forty-eight daguerreotypes, nacoloured. These are ex-cellent for heanty of execution. The portraits stand forward in bold relief, apon a plain background. The artist having placed implicit reliance npon his knowledge of photographic science, has neglected to avail himself of the resources of art. The portraits of General Taylor, Calhonn, General Cass, and James Perry, are strikingly excellent; but all pre so good that selection is almost impossible. The Jury awarded the Prize Medal to Mr. Prady.

WHIPPLE (United States, No. 451, p. 1464) has exhibited several specimens of diagnerreotypes, amongst which one of the moon may be mentioned with the highest commendation: this is, perhaps, one of the most satisfactory attempts that has yet been made to realise, by a photographic process, the telescopic appearance of a heavenly body, and must be regarded as indicating the commencement of a new ern in astronomical representation. The same exhibitor has included in his collection three pictures, containing several full-length figures, well grouped, and artistically arranged. Each part is well in focus, and the definition is admirable. An agreeuble tone pervades all these pictures. A Prize Medal was awarded

to Mr. Whipple. Mayall (United States, No. 491, p. 1465) has con-tributed largely to the American collection, his works here being characterized by the same broad masses of light and shadow as those which he has exhibited in the British Department (No. 291). The subjects of the pic-tures in the present series consist chiefly of small groups and portraits; also two cases containing illustrations of the Lord's Prayer. The majority of these (most of which are uncoloured) are effective, verging upon the theatrical are uncotoured are enecutive, verging upon the streament in point of style, but they are not all equally well defined. We should be doing Mr. Mayall an injustice, were we not to mention, as a brilliant exception to the above criticism, a small figure of a female reclining; it is exquisite in delicacy of execution, harmonious distribution of light and shade, whilst an admirable tope pervades the whole pieture; this, the finest of Mr. Mayall's contributions, is free from colour, and is daguerreotyped from a classic work of art. The Jury awarded Honourable Mention to this exhibitor

EVANS, New York (United States, No. 105, p. 1440), as exhibited several portraits of great merit. Those of has exhibited several portraits of great merit. Those of the Rev. - Ingersoll, Dr. Nott, Dr. Lord, and Dr. Shelton, are characterized by peculiar excellence; also two portraits, each of a lady sitting near a table upon which a group of flowers is displayed, deserve to be noticed as fair specimens of the perfection to which this application

sair specimens of the perfection to which this application of science, to the purposes of art, has been carried. Million BROTESING (United States, No. 109, p. 1449) have exhibited a scries of portrains of more than ordinary size. Conspicuous among this collection are the heads of Wallack and H. W. Mende. The modulation of light and shade upon these last is admirable, as well as the details of the features, and the total absence of all barshness: the artistic effect is excellent. Greater credit is due to this collection of portraits, than to the series of allegorical subjects exhibited by Mr. Meade.

Paarr, Richnoyd, and Co. (United States, No. 264, p. 1452), have exhibited several daguerreotypes, of

various degrees of excellence. The profile of an old man, assisted by colour, is the best. WHITEHURST, Virginia (United States, No. 377, p. 1461), has exhibited twelve views of the Falls of Ningara. These are admirable, and possess a degree of reality not always attained in landscapes produced by the daguer-

reotype process. Among the remaining exhibitors of daguerreotypes in the United States Department are

the United States Department are—
GATTY (United States, No. 125, p. 1441), Boory (United States, No. 25, p. 1445), Whytramarur (United States, No. 25, p. 1445), Whytramarur (United States, No. 25, p. 1447), and Hoon (United States, and of whom, 25, p. 1447), and Hoon (United States, No. 25, p. 1447) and the control of the Comparison of Philadecology (United States, No. 22, p. 1427) has trained to present the Comparison of gias, designated by him under the name of hyaletypes, being delicate manistreet, excluditly adapted for magic-bonic delicate manistreet, and the properties of the being delicate manistreet, and the properties of the life of the properties of the certific. This is also taked in separate comperments: it is clear and good in colour, and forms an effective piece. Hazanos (Ultitled States, No. 22.), p. 1450) has the properties of the properties

also some dagnerreotypes of a very superior description.

In turning our attention to France, we find several dagaerreotypes, which, in contradistinction to those of America, are characterized by large masses of light, in

^{*} See the Illustrated Catalogue, and the Athengum for See the Illustrated Catalogue, note Il. p. 428.

which is expressed the greater amount of detail and minutia. They are not so entirely free from glare as those of America.

THIBMAY (France, No. 1038, p. 1238), has exhibited eight diagentrotype views of Lyous; they have a samp look, and are very brilliant, but are wanting in artistic light and shade. Apprint of M. Thierry, himself deserves particular commendation, and is far superior to the above-mentioned pictures. The Joseph Considered the above-mentioned pictures. The Joseph Lyounder of the picture of

MACCOMBLE (Funce, No. 620, p. 1207) has enhibited in ran of very high-coloured diagnerotype portrait, no ran of very high-coloured diagnerotype portrait, are than to photographic science. It is difficult to any whether the harmonics and rice hosting of the President choice, it applied to these portraits, or the materly most commendation. Art is here engrified on science, the latter being merged in the former, and the impression of a beautiful artistic prediction. They are charming, but we repeat belong more to set than to science. The Juny have a surface those works the countries directly are constituted to the contract of the con

Jury nave awarest uness works monourned sensition. Sanatrian (France, No. 1467, p. 1246) exhibits a single disquerreotype portrait of large size (8 in, by 6 in.), which is every way excellent. It is entirely free from glare (to which its low position contributes not a little, the light coming from above), and in expression, freedom from constraint, and perfect representation of texture,

may rank with any single piece in the Exhibition,
PLAIONOL (France, No. 1679, p. 1257) exhibits dagmerroot jees rather as specimens of the production of his large
camera (though not of the full size which that instrument
is expalse of producing), than as elaiming especial distineton in this surricular department of art.

timeron in this particular department of art.

GOTIN (France, No. 241, p. 1188) exhibits a series of
coloured daguerreotypes, which, however, want brilliancy
and purity of colour; the back grounds are also out of
focus. Au mondoured portrait, 73 in, by 6 in, does
better justice to the powers of this exhibitor.

KOUNKE (Hambargh, No. 103, p. 1140), and VON
MINETOLI (Prussia, No. 191, p. 1058), have exhibited

Vouga (America, No. 739, p. 1044) exhibits dagnerrectypes, to which Honourable Mention was awarded by the Jury.

Talbotypes - Calotypes - Sun-pictures.

Bleezas (Clau XXX, No. 30), p. 800), of Potentionoph, has calabided a great many esterpy pertures, compared to the property of the compared to the compared and expansize of execution, and electre to be made cannot be found to premise as of beingraphy in the banded among the first of premise as of beingraphy in the property of the compared to the compared to the compared described at some length; it is now subpined here, from any of the compared to the compared to the adjusmentable. He observes that, with regard to the adjusmentable in the compared to the entire of the compared to the entire to be decided out to the compared to the the less as also the time of exposure, are so much as the compared to the compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the compared to the continuous compared to the compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the continuous compared to the compared to the compared to the compared to the continuous compared to the compared to the compared to the compared to the continuous compared to the compared to the compared to the compared to the continuous compared to the compared t

Ross and Thomson (Class XXX., No. 292, p. 839) have exhibited several beautiful Talbotype pictures, consisting of views from nature, interiors, groups, &c., and they are the only exhibitors, in the British section, of photographs by the albuminous process; which, in practice, they appear to have carried to a high state of perfection, having not only substituted it for the old method of taking the uegative proofs on speer, but having, in soore than one instance, exhibited the systility proof upon the all-unmerited glass itself. In addition to the extremo clearness observable in the details of their instance, or objects in general, we may take notice of the executive objects in general, we may take notice of the executive boast of the time which their works childs. No easy are the shadows deep and Rembrand-to-cking, where mainle to the effect required, but the middle distance display a beauty of colour nowhere equalled, excepting December 1997.

Department, reason of the variation of time which there weeks present, in controllationation to the fine Vanajake linewa and deep hadaway, we may mention a mail joice howes and deep hadaway, we may mention a mail joice which is the first of the produced by taking the negative proof on althouranteed glass, and wrater to be reported by the process that the produced by the process the whiten become black, and rice creat, the proof to high copingly that days a backer pround, they then become black, and rice creat, the proof to high copingly that days a backer process the whiten become black, and rice creat, the process that which have been been been also become a support of the process that the process that the continue of the days are and possibly to the contenting of the larget and possibly profes, and effecting a vast range of beautiful time of incatamathic relations to a vast range of beautiful time of incatamathic relations.

the finance of a defined operation, the alternate is a difficult operation; the method adopted by Boss and Thomason differs from the Freech process (which is due to M. Nispeco, and is usually selled the "allemantons process"), plate and revolving it over a slow best, for the purpose of counting its even startibulisms. As above in the practice of these exhibitors, this method would neen to be perfectly on the process of the control of the

of Messrs. Ross and Thomson, A number of Talboxypes, also exhibited, display equal variety of tiut, and a depth and richness of tone without any straining for effect. A Council Medal was awarded to Messrs. Ross and

Hina and Adamson (Class XXX., No. 500, p. 800), have exhibited very many Takety pag groups, remarkable for easy and graceful arrangement. They are, in effect, after Rembrandt, being made out in broad and deep-toned masses of light and shade. As a whole, they are very sketchy and spirited. The titus are rich and varied both in depth and colour, and are of a rich sepia. They have received Hanourable Mention from the June.

have received Hanourable Newton from the Jury.

HINSNESS and MALONS (No. 27), pp. 441, 442) have
callitated Tablopyees upper, essaining of opies of
various small groups, for. These are all natural and
pleasing, and great delicacy is observable in the lights
and should, the tone of which is a fix own me spin frown.

The greater part of these pictures are small portrial;
ore, however, which is fix by 64 in, is very good, and
one, however, which is fix by 64 in, is very good, and
arrainst allil which they display.

Messrs. Hemerana and Malone also exhibit specimers of the eyanotype and chrysotype processes of Sir J. Herschel, the chronotype of Mr. Hunt, and Tabbotypes tinted by the application of caustic potash and a lead salt. A Prize Medal was awarded by the Jury to Messrs, Hennemana and Malone.

Colla, R. and L. (No. 303, p. 449.), have exhibited reveral sun-pictors on poper. They per rather blotty in appearance, but are good in colour. Views of Window Carle and Soke Church deverse high commendation.

Hansan (Class XXX, No. 298, p. 839) has exhibited two calcutpe picturers, one a landscrape; the reflections as shown in the water are excellent. The fluctuation of the reflections caused by the ripple of the water is very

reflections caused by the ripple of the water is very beautiful, and true to nature. The execution of the pieture is good, and the tints are clear and delicate. Owen (No. 670, p. 467*), of Bristol, has exhibited a series of calotype pictures, most of them landscapes and wood scenery. They want clearness of definition, being somewhat black and heavy. Mr. Owen states binned! to have been able to execute in a single day, in a journey of 300 miles, ten large-sized Thiotypes of local scenery, each paper being prepared on the spot. The preparation is greatly facilitated by a glass spreader, of his own

invention, by which the colorious are evenly applied.

COLLES (No. 22, pp. 941, 942), of Jeney, has exhibited
a frame, containing several calcetyee pictures, chiefy
portrain and demosties seeces. These are not all equally
good; many of them are bleety and wanting in depth,
several Tallovly-pp, being a series of untouched pointives,
from collection negatives, oo plate glass. He also exhibit
nother photographs from paper acquirees, but they

bitty and want mero light.

Historian (Class X., No. 302, p. 442) is an exhibitor of Talbotype pictures, lundscapes chiefly. Being near objects, such as cottages, trees, &c., there is no room for acrial perspective. They are very cleanly exceeding.

Field and Son (No. 250, p. 435) have exhibited calo-

Town.

Towns. To the No. (10, p. 1971) has contibuled as reveral layer and beautiful place-graphic product, angian and paper, dublined by an appearing made by Levilous and paper, dublined by an appearing made by Levilous trees on glass, front of the thirty of the North Bane, "the levil tree of glass and the levil trees of glass and the levil trees of glass and the levil trees of glass and are pre-centionely beautiful. Two the place of the graph of the grap

Whether to a remember. A Contact Medial was swended to M. Martena. One M. 44, p. 1189 has relabilised Barrano (frience, No. 44, p. 1189) has relabilised Barrano (frience, the subject of which are chiefly object of the contact of th

Factorion-Haramo (France, No. 856, p. 1209) has crabibied several suspicious of missi is logatio, lious, and Paris. These are all excellent; the colour is good, and the atrinic effect admirable. They appear to be pocompared to the several several several several several deserves especial mention for the perfectly artistic expression of the whole, combined in M. Endernea several sampletance. Some of these are good, last many new heavy and wasting in defall. These petteres war, in we heavy and wasting in defall. These petteres war, in

tint, from sepia to olive citrine.

HENRI LE SECQ (France, No. 592, p. 1206) has exhibited several calotypes; the subjects are architectural.

These pictures may be mentlosed with great commendation as regards their photographic flishis, lut usersyl and of them exhibit a degree of acciliprose in sulpating the visual axis of the account to the true benriood literation, visual axis of the account to the true benriood literation, and trivial axis of the account to the true benriood literation, stilling converges in the picture, contraverse the rules of perspective, and produces an effect highly supplexing. This is the most common fluid of photographic representation by the aid of a canous, and it is might to modes it to implicate the provided with a small quint-level to secure than alignment in the field, independent of trial.

this adjustment in the field, independent of trial. Fernann, Blasspaars (France, No. 1531, p. 1251) has exhibited several Tallout pe pictures, the positive provise being obtained by a process which admits of 200 or 500 impressions being taken from the same negative proof, the price varying from five to fifteen entires, necessing to the size. These are not wholly successful; several of the pictores are dark and blotty, and somewhat resemble

energravings taken from a worn-oot plate.

Coursex (France, No. 1572, p. 1223) exhibits a series of positive Talbotypes, from negatives on paper, in all seven subjects, six of which are of exquasite beauty.

Albert (Frankfort)-on-the-Maine, No. 7, p. 1121) has

ALERT (Franktort-on-the-Manne, No. 7, p. 1121) has schahited sun-pictures of large size, but they are "fuzzy," being ill-defined and void of effect. Two specimens of smaller size, one of them coloured, are good. CREVALER (France, No. 1729, p. 1259) exhibits some photographic proofs.

photographic proofs.

MATER (France, No. 622, p. 1207) has a series of miniatures, coloured on Talbotype grounds. They are of crushitish enasty, and give the idea of perfect likenesses; hat the use of the brush being obvious, they are rather to be regarded as works of art than of science.

To Be regarded a variable of the control of the con

In closing our remarks on this department of the Exhi hition, we may be permitted to record some degree of disappointment at the absence of specimens of the application of photography to any departments of representation, other than such as please the eye or administer to personal feelings. As regards its application to an infinity of useful and instructive purposes, we have literally nothing! find, for instance, no specimens of copies of ancient in-scriptions (a few incidentally occurring on the Roman ruins, perfectly familiar to every one, only excepted)-no delineations of tropical or remote scenery-no specimens (for the single exception of Claudet's spectrum is hardly to be cited) of the actinic spectrum on chemical prepara-tions, or on natural vegetables or animal colours, -no impressions of the lines in the photographic corresponding to those in the luminous spectrum, - no magnified representations of the microscopic products of nature, or of the dissected parts of plants or animals,—no copies of pages of ancient manuscripts,—no miniatures of printed books (bolding out the promise of future publications in miniature), or that of condensing in volume for preservation in Muscums, * &c., the enormous mass of documentary matter which daily more and more defies collection from the mere impossibility of stowage, but which will one day become matter of history, - and a thousand other applica-tions that it would be tedious here to mention.

Connected with photography, we saw also notice the absence of any specimens of scotography, or the art of copying engravings by simple juxtoposition in the dark by obscure inter-radiation, invented by Mosec.

Magnets.

Exhibitors of magnets are few in number; among them LOGEMAN (Netherlands, No. 87, p. 1147) and HENLEY

 WE are informed that a catalogue of the National Library of Paris, in which the photographic fac-timile of the title-page of each work, in ministure, is registered, in actually in progress. (England, No. 428, pp. 457, 458) have exhibited the most powerful steel magnets; it is satisfactory to learn that both these exhibitors are still applying themselves to their further improvement.

HEABORN (No. 439, p. 461) deserves special notice for the attention he has devoted to ascertaining the receptive and permanent magnetic powers of cast iron, both in

separate plates and in their combinations.

As early as the year 1832, Dr. Scoresby commenced n aries of experiments on the magnetic properties of cast iron, bat which, owing to the thickness of the masses employed, did not yield decisive results; prior to the year 1844, he repeated his experiments upon different kinds or east iron, and found that "cast iron possesses considerable powers of magnetism, both in capacity and retentiveness, though greatly inferior in both qualities to those of properly-hardened steel;" with several other interesting results. The general results arrived at hy Dr. Scoresby, though calculated to show the nasuitable character of the specimens and forms of the cast iron employed by him to general magnetic purposes, were yet of such an encouraging nature, as to lead to the hope that more important results might be obtained by the employment of cast iron in large masses, and in different forms

Mr. Hearder was led, in the course of his experiments to consider that cast iron had not been subjected to a sufficient variety of tests, and he was still more coofirmed in this opinion, by observing how its mechanical properties varied, according to the temperature of the different kinds of iron, and he concluded that the conditions which acted against its being used as a bar magnet might be made available for one of the horse-shoe form. In 1843, he made the magnet now in the Exhibition, which is still concessed of considerable power, as determined by the

The following are the particulars of the magnets exhi-

bited:-LOGEMAN (Netherlands, No. 87, p. 1147) has exhibited the most powerful permanent magnets in the Exhibition.
The following are the results of the experiments:—

One whose weight was 1 lh. & oz. carried a weight of 16 lbs. 94 az.

One whose weight was 6 lbs. & oz, carried a weight of 66 lbs, 34 cz. One whose weight was 101 lbs, 12 oz, carried a weight of 436 lbs. 12 oz.

A Conneil Medal was awarded to Mr. Loreman. The exhibitor of the next best magnets was HENLEY (No. 428, pp. 457, 458), and the results of the experiments

are as follows: A magnet weighing 21bs, 5 os, carried a weight of 31 lbs. 51 oz.

A magnet weighing 8 lbs. 4 oz, carried a weight of 56 lbs. 14 oz

A magnet weighing 32 lbs, 6 oz, carried a weight of t20 lbs. 44 oz. SHAW and Sov. Sheffield (Class XXII., No. 216, p. 617),

exhibited several magnets:-One whose weight was 7 oz, carried 4 lbs., and

One whose weight was 7 lbs. 2 oz. carried 61 lbs. 72 oz. HEARDEN (No. 439, p. 461) has exhibited a cast-iron

compound horse-shoe permanent; magnet. This magnet was constructed with a view to its being applicable to every porpose requiring high magnetic power. It con-sists of 24 plates, 2 loches wide and 0 19 inch thick, cast in the form of a horse-shoe, which is t6 75 inches in The 24 plates are strongly fastened together; the poles, which are distant from each other 1'25 inches, are capped with soft iron, for the purpose of concentrating

the magnetic power; at the same time it renders the the magnetic power; and grinding of the poles nanecessary.

The bars being made of

The construction is simple. The bars being made of iron, hardened as much as possible, require no preparation to adapt them for magnetization. The economy of construction, as compared with a steel agnet of the same dimensions, is estimated as 4 to 1.

It is designed to be made available for the construction of electric machines for telegraphic or electro-chemical purposes, and was manufactured at Mr. Hearder's esta-blishment at Plymouth.

Mr. Hearder observes that, whatever be the relative powers of the plates previously to their being put together, as a mass they are found to undergo a considerable change; the two external magnets having their poles slightly re-versed, the two next being neutral, and the rest baving direct polarity, being strongest in the centre, and grade ally diminishing towards the two external plates. O say inministring towards the two external panes. On testing the individual powers of each magnet, after their several combinations, for three years, the znm of the whole was less than 15 lbs., whilst collectively they were

capable of lifting n weight of more than 100 lbs.

Other particulars concerning this magnet are to be found in the Report of the Royal Cornwall Polytechnic

Institution for 1850. This magnet was found to weigh 71 lbs, 8 oz., and to carry a weight of 120 lbs, 9 oz, Mr. Hearder has exhibited a powerful horse-shoe per-nament steel magnet, intended for all purposes requiring

high magnetie power. It is composed of a large number of wide and extremely thin horse-shoe plates, cut out of thin sheet steel, tem-pered and hardened sufficiently to admit of their being tlattened with a hammer. The magnet weighs 391bs., and Mr. Hearder says will support pearly 250 lbs., with a round-faced keeper. It is intended for magneto-electric purposes, where great power is required in a small space. purposes, where great power is required in a discount of this magnet was found to weigh 39 lbs., and to carry a

liunnett (No. 438a, p. 461) exhibits a carbonized castiron magnet; the carbonization having been performed by prussate of potash and oil. This magnet is offered as an improvement on Mr. Hearder's cast-iron magnet, as shown at the last Polytechnic Exhibition. On trial, this magnet was found to weigh 27 lbs. 8 cr., and to carry 35 lbs. 9 ex.

Magnetical Instruments.

weight of 1121bs. 9 oz.

Brooke (No. 144, pp. 422—426) exhibits photographic apparatus for the self-registration of the changes of position of the declination magnet, of the horizontal force magnet, and of the vertical force magnet The three magnets are so placed, that the residual effect of each pair upon the third is a minimum, which is to be

determined by experiment. The principle is the same for all, viz., wrapping prepared photographic paper around a cylinder whose axis ix placed parallel to the direction of movement to he regis-

treed, and which is turned round uniformly by clockwork.

The light, from a gas-laup, passes through a small aperture placed near it, and falls upon a concave mirror m metal, which rests in a stirrup firmly connected to the magnet, so that it partakes of all the angular movements of the magnet. The pencil of light is then deflected from the mirror to a plano-convex lens, placed parallel to the anis of the cylinder, and near to it: this lens condenses the line of light to a definite spot of light on the paper. This spot of light, therefore, moves with the movements to be registered,-to the right and left, in a horizontal plane, in the case of the declination magnet and horizontal force magnet; and up and down, in a tical plane, to register the movement of the vertical force reagnet; the cylinder, as before stated, being turned round by clockwork. Consequently, there is traced upon the paper a curve, of which the abscisse, measured in the direction of a line round the cylinder, is proportional to the time, while the ordinate, measured in the direction of the axis of the cylinder, is proportional to the movement of the magnet.

^{*} See Scoreshy's "Magnetical investigations," Part II., Chap, vill., pp. 3%9-347.

† It was described in the "Electrical Magnalue," October. 1845, vol. II., p. 137.

2 These magness are termed "permanent," In contra-

distinction to the temporary electro-magnets.

A base line, or a line from which to measure the ordi-

yellow light :-

nates, is traced upon the paper by the action of a spot of light proceeding from another gas-lamp placed near the cylinder, and passing through a slit fixed to the carrier of

the cylinder. To the horizontal force magnet there are uttached upparatus for correction of temperature. That for the horizontal force magnet, which is described

that for the normonial love magnet, which is described in the Illustrated Catalogue, page 411 (Second Part), is based upon the following consideration:—

Let (b) be the lower interval between the two divisions

of the suspension skein, the equation of equilibrium

$$m X = \frac{o b}{b} \sin t$$

en the arrangement adopted is to make the variation of b, by the effect of temperature, equal to the variation of m, arising from the same cause. This is attempted to be of which are inclosed in two zinc tubes, whose adjacent ends are separated by the width of the clamp. The zinc tabes and glass rod are clamped together at such a dis-tance from the centre of suspension, that the ratio of the difference of linear expansion of the length of glass and sine, intervening between the clamps to the interval (b), may be equal to the temperature coefficient.

The clamps are adjusted in order that, when their position has been approximately determined by calculation, the error of position may be corrected by experiment.

As the expansion of glass and zine are both taken to be As the expansion of glass and rise are both taken to be miform, and are a say rea for beyond the limits of miform, and are a say rea for the beyond the limits of sent the coefficient of (f), and the residual error of the corrected instrument must be expressionally determined. The arrangement for the correction of the vertical The arrangement for the correction of the vertical to the magnet, parallel to its acts, and in the same plane as the knife-edges. The middle point between the free-ing point of the thermonwer and the centre of the ball

ling points in the proposite the centre of the magnet.

Let *pe the weight that at a distance of from the line of suspension would be equivalent to the temperature correction for 1° Fabrenheit, or 32°; we the weight of merenry contained in one degree of the scale of the thermost the distance of the freezing point from the

nometer; p the distance of the freezing point from the centre of the ball, and 2 the length of one degree of the scale; also let $cx + \epsilon x^a$ be the temperature coefficient of the magnet; then if

q = p w, and c::::p: ».

The statical moment of the mercury displaced from the ball at any temperature x° above 32° , will be equivalent to cx + cx, and will represent the temperature cor-

We will now proceed to detail the process of preparing the paper, bringing out and fixing the photographic im-The paper used should be of a strong even texture, and

prepared with attention, to the exclusion of all foreign anbetances which might combine injuriously with the chemicals used.

The first preparation of the paper is with-

Isinglass 4 grains, Distilled water 1 fluid ounce,

The water is boiled, and a portion then poured upon the isinglass, which, when dissolved, is poured into the remaining water, and all is boiled together. To this solution, filtered, is added-

12 grains of hromide of potassium, and 8 grains of iodide of potassium.

• The correction for temperatura has hitherto, at nearly every place, except at Greenwich, been applied to mag-netical observations, on the supposition that the decrease of magnetical force was proportional to the increase of least; but this is found to be very far from being that case. The correction for temperature of the horizontal force magnet at Greenwich is represented by 0:00009050 (t = 32) + 0.000000626 (t - 32"; the second term here becomes very large, when the temperature departs much from 32°, and in Mr. Brooke's arrangement is not taken into account.

One side of the paper is then washed with this solution, and dried quickly before a fire. The paper thus prepared will keep in a dry place for two months.

When the paper is required for use, it must be washed with the following solution, in a darkened room with a

Crystalline nitrate of silver 50 grains Distilled water I finid ounce.

To bring out the impression, the paper is washed with the following solution : -

Saturated solution of gallic acid 1 onnce. Acetic acid a few drops,

To fix the impression, first wash the paper well with water, then with the following solution:-Hyposulphate of soda 1 drachm. Distilled water 5 ounces.

And, lastly, wash excefully with water, and leave the per to soak for a short time. The impression is then A Council Medal was awarded to Mr. Brooke for this beautiful application of photography to the registration of natural phenomena.

Wilton (No. 402, pp. 452, 453) has exhibited three Fox's dipping-needles, furnished with needles of 61 inches, 4 inches, and 2 inches in length respectively. with the longer needles are identical in all particulars with those which have been used successfully on board of ships, both for the observation of dip and relative mag-

netic intensity.*

PARKES and SON (No. 671, p. 467) exhibit a number of ocket-compass

GREEN (No. 446, p. 462) has exhibited several magnetic sun-dials, with metal and agute caps, adapted to every degree of latitude. They are mounted in boxes made of various materials. Mr. Green has also exhibited various other son-dials, some of which are fixed in round mahogany boxes with levels and adjusting screws, and others fitted up for north and south latitudes; also several horisontal sun-dials, and ivory circular thermometers, with compass or magnetic sun-dials attached to them. Mr Green also exhibits pocket-compasses with metal and agate caps, and others also with floating cards, &c., variously mounted in round boxes with improved hinges, Several compasses are fitted up in variously constructed boxes of ivory, brass, German silver, &c., together with others in the form of a watch, of various materials, some being made of leather, others in gilt and silver case Mr. Green also has exhibited cone-compasses and hrase

gimbal-compasses, intended for use in small boats. YEATES (No. 352, p. 446) exhibits a prismatic compass adapted to measure both horizontal and vertical ingles, with spiral level attached in such a way as to be appli-cable in both cases,

Electrical Instrum

The electric instruments are few in number, and there is not one adapted for the purpose of determining the quantity of atmospheric electricity for meteorological pur-poses. This is a matter to be regretted, as the present

state of meteorology greatly needs a simple, inexpensive instrument, adapted for the observation of atmospheric electricity, and one which would be pniform in its action under uniform circumstan One exhibitor, Westmoreland, (No. 444, p. 462) has,

however, the merit of exhibiting a gutta-perena electrical machine, which holds out the hope of obtaining electricity of tension on a large scale by the application of steam-power, and thus a motive force, which may serve for the movement of machines, or enable us to accomplish objects at present quite unforescen, but which the habitual use of an electric power commensurate with that of lightning

may bring into view. WESTMORELAND (No. 444, p. 462) exhibits a gutta-pereba electric machine. It consists of two rollers of equal dismeters, placed one above the other, over which a band of gutta-percha, 4 inches in width, is stretched;

^{*} For description, see Hustrated Catalogue.

opposite to the axis of each roller, and on either side, are placed too brashes of bristles. There is a double conductor connected by a curved brists roll hasping over the top of the machine, similar in form to the conductor of plate-glass machines, and also a simple means of tightening ar loosening the band, to correct the expansion and contraction of the guitts-percha

Contraction or tag guara-per cells.

It is stated that the cleerineity given off appears to be of high intensity, and, under favourable states of the weather, nearly as much in quantity as that from an ordinary plate-glass machine. The muchine exhibited, when it good order, gave off sparks from about three-quarters

of an inch to an inch in length.

This application of gustra-percha is quite new in practice," and indicates the discovery of a new motive power, which promises to be a measure of obtaining a snepty of electricity of almost unlimited extension: this application of gustra-percha opens a new field in electrical research well worth explaring. A Prize Medal was voted to Mr. Westmorefund.

With the control of t

gold leaf. This is a benithfus instrument.

They also exhibit a deflente statistic givenometer, for estimating minimte currents of voltac deletricity; the lower needs is auromated by a cold of wire 23 yands in lower needs in surrounded by a cold of wire 23 yands in which a rack-work motion, and a niscroscope for roofing. And they also exhibit larm's thermo-electrometer, for estimating small currents either of atmospheric or voltaic electricity, by the heating of a form metallac with

DELEUIL (Prance, No. 100, pp. 1173–30) exhibits an electrical machine for medical purposes, furnished with an arrangement to vary the strength of shocks. It is simple and effective in its operation.

MESSIM (No. 437, p. 460) has exhibited hydro-electric chain batteries, consisting of the metallic combination of

various galvanie clements; soarranged as to be very postable.

They are designed to be worn on the body for the purpose of effecting the entre of various chronic diseases by means of the electric current, which in its passog from one pole to the other passes through that purt of the body encircled by the chain.

Thermo-Electricity.

In 1811, Lemore, of Berlin, found that, if two metals of different kinds be in any way inventi and coles comester, and heated at the points, a current of electricity flowed through the metals, while, rousined passing in the same direction whilst the heat increased, cassed to flow when, the integrations was continue, and flowed in the work of the competition was continue, and flowed in white the continue of the

animos on the district, by the Corros-disposal health gasment of the control of the control of the control of the A control led of health inc. 3 in their in distincter, imported on host stand, relative to five therms-elective by substring, and are exciteded. Mr. Jone Jan cothikis a surface electromagnet, consisting of a thick piece of wranght time enveloped by a honder of supervisor. The contract of the contract of the contract of the contract of moderate power produces such a powerful attraction between the above dectromagnet and its any to be applied in order to draw them assuder. This libration the extraordinary attractive power of iron

Hansson (No. 420, p. 455) exhibits an electro-magnetic engine which acts on the principle of the induced augustic power of a compound coil of insulated wire conveying the current to a series of plates of soft iron, and nitracting them within a suitable aperture.

As there is only one body of wire in connection with cach coil, the retarding influence of the electromagnets acting upon each other, after the current from the barry is cut off, is avoided, and by this arrangement the effects of the secondary currents are much revision. The effects of the secondary currents are much revision. The effects of the secondary currents are much revision. The effects of the secondary currents are much revision. The excellent limitation of the source of the secondary cut of the sec

1st. An almost malimited power and length of stroke.
2nd. The greatest possible amount of power from the
battery, by reducing the influence of the secondary
current to a minimum.

3rd. Avoiding the retarding influence caused by the retention of magnetism in the ordinary method of application by magnets; and from the body of iron netestances and powerful induction of magnetism ensures and the colls exposing a large surface, an instantaneous and powerful induction of magnetism ensures, and thus the highest speed is obtained.

4th. By the employment of a compound conducting material, a strong current of electricity is transmitted, and a much greater magnetic effect within the same space is obtained.

5th. The larger the iron plates, and the greater the power of the battery, the greater is the economy of this

engine.

KNIGHT and Sons (No. 453, pp. 462, 463) exhibit an electro-magnatic engine. This is probably the simplest form by which an electric current can be made to work by its action on permanent magnets, though not the most effective. Four coil-magnets are fixed rectangu-larly on an axis, and revolve within a circle formed of four fixed magnetized quadrants. The contacts are made and broken by rubbing springs on an axis (so it appeared on examination); the nicety of construction consisting in the adjustment of the moments of union and disruption. so as to obtain an effective difference of action always in the direction between the two opposite poles of the per-

manent magnet. Knight also exhibits another electrical machine, in which a bar is alternately pushed and polled, and so working on a crank and turning a fly-wheel. these machines the mechanism itself provides for the occessary alternate making and breaking of the circuits. It is probable that little power is obtained, for the greatest care appears to have been taken to destroy fric-

on, by making the fly-axis revolve on friction-rollers. WATKINS and Hill (No. 659, p. 466°) have exhibited electro-magnetic engine. Two horse-shoe electroan electro-magnetic engina. magnets are alternately excited by two electric currents, and each as it becomes a magnet attracts one of the arms of a rectangularly bent iron har, which is thus kept in a state of oscillation round a pivot from one magnet to the other. The ends of the bar carry rods working on which are connected with cranks rectangularly placed on an axis. Thus the dead point of one crank with the active state of the other, and the axis is majotained in rotation with its fly-wheel. The magnet, bars, and erank are so arranged along the axis as to give room for the cranks, of which there are two, though, in fact, there might be any number of magnets and eranks working simultaneously.

The alternation of the circuit is kept up by a mechanism worked by the machine itself. ALLER (No. 413, p. 454) exhibits an electro-magnetic railway-train alarm; it consists of a copper chain, intended to be placed over every carriage, the connection between each being established by the guard-chains; on the circuit being completed, the ordinary steam-whistla discharges the steam. The arrangements are as simple as well can be.

CRESSWELL (No. 417, p. 454) exhibits an electro-mag-netic engins for the production of motion; it consists of two pair of electro-magnets, between which a keeper vibrates and communicates motion to a wheel and cank, FROMENT (France, No. 1609, p. 1254) exhibits an electro-magnet acting alternately, by elevating a lever, which communicates motion to n erank. He also exhibits a circular arrangement of coils, two of which are

io action successively. Barron (France, No. 1113, p. 1231) exhibits an electromedical apparatus with a double current; but as this instrument is intended for medical purposes, and not as a motive power, it scarcely falls within the provioce of this Jury. Ньовти (Denmark, No. 47, pp. 1359, 1360) has cxhibited an electro-magnetic engine. It consists of two sets of hollow horse-shoe electro-augments, conical inside, with a corresponding number of solid electro-magnets, which, by mutually attracting each other, make a double stroke of 4 inches in length. The power has been found, by means of a spring-balance, to be about 30 lbs. at tha commencement of the stroke, when the distance of the commencement of the strong, when the distance of the respective poles is about half an inch, decreasing slightly by degrees as the piston enters the hollow electro-magnet. The current is broken by the end of each stroke, and the destroying effect of the spark prevented by moistening the surface of communication with diluted sulphuria acid;

ne repelling power is applied.

Mr. Hjorth also exhibits a diagram and plan for an

conical inside, and are connected outside with the arma tures (?) of the magnet, which form the connection between the respective poles. From the apper and lower part of the arrangement extend withinside four iron plates with ribs, which in the centre are connected with corresponding diamagnetic plates and ribs. These plates are applied for guiding the motion of the piston, and serve at the same time as a means by which metallic contact may during each stroke be established and broken between the piston and any one of the respective plates. For this pur-pose, four pairs of rollers are placed withinside the piston or hollow shafts, which are arranged on the fourwaycock principle, with a ring inlaid with a diamaguetic metal between the rings and shafts, that the magnetic bearings may be brought into contact either with the similar or diamagnetic parts of the same rings

The required motion of these rings is produced by small eranks inside the piston, joined to the connecting-rod in such manner that each pair of cranks moves in opposite

Whilst the engine makes a down stroke, magnetic contact is established between the north pole and piston; the polarity thus acquired causes it to attract the south When the down stroke is performed, the magnetic contact between the north pole and the piston is broken by turning the upper pair of emaks in one direction, whilst similar contact is established between the south pole and piston hy moving the lower pair of cranks in the opposite direction. A reciprocal motion being obtained in the above manner, the electric current passes continuously in one direction round the piston and each of the poles, the motion of the piston being reversed by simply breaking and establishing magnetic contoct. On the piston passing out of the one pole it enters the other, and induces thereby, according to the law of the secondary currents, two currents in opposite directions, and thus both are neutralized. The advantages assumed are:—

lst. The obtaining a stroke of any length with one hollow electro-magnet, the piston being a moveable extension of either of the poles, ottracted by a succession of polarities, the acting surfaces of which extend to the whole circumference.

2nd. The arranging the pistoo in such manner that it may be extended to any size, without its being beovier thou a pisson in o low-power steam-engine of the same size, the power being expressed in pounds per square inch. 3rd. A prevention of the destroying effect of the electric spark,

4th. A neutralization of the secondary currents and o vention of their reaction The following table, as obtained by Mr. Hjorth, shows the attractive power obtained with o borizontal electromagnetia engine of 16 inches stroke, the poles of the moveable magnet being seporoted 6 inches, or, in other words, the piston being 6 inches square:-

Inches, Distance of the respective $\begin{bmatrix} 5\\4\\3\\1\end{bmatrix}$ The $\begin{bmatrix} 72\\80\\98\\14\end{bmatrix}$ attractive $\begin{bmatrix} 72\\80\\98\\140\\160\end{bmatrix}$ 75-58 And the angle of magnetic

A Prize Medal was awarded to Mr. Hjorth, Electric Telegraphs,

As might have been expected, there are exhibited voltain butteries; galvanometers; electro-magnets; tele-graph wires; wire for submarine purposes; printing telegraphs: in fact, the Exhibition is rich with a large number of very ingenious contrivances, applicable to every stage of electric telegraphic communication

The Electric Telegraph Company, which was esta-hlished in the year 1846, have evidently used much diligence in possessing themselves of numerous patents, commencing with Cooke and Whyatstone's five-needle the fine collection they exhibit are some of the most improved arrangement, consisting of only one bollow valuable inventions, in point of real practical utility, that electro-magnet, the respective poles of which are divided into three or more square rings, which are nonewhat into three or more square rings, which are nonewhat in the provided of the provided into the control of th of, have been, it is presumed, found to be of little practical

It would seem that the needle telegraph, giving conventional signals, has obtained a firm standing in this country; and with the recent improvements in the galvanometer, it has certainly attained a high degree of surfaction.

The form of the needle in most general use is that of a small rhomboid, into which much magnetism can be imparted, and which winners with great steadiness and rapidity. It, however, has the disadvantage of parting with its magnetism much more readily than longer needles, and requires to be re-magnetised more frequently. When we reflect how year, few years have claused since

When we reflect how very few years have elapsed since at the was known just the subject to the elapsed since at the was known just the subject to the elapsed of the subject to the property of the subject to the subje

ance which he has freely given.

The idea of utilising the electric form of force, so as to have the means of rapid intercommunication between places far apart, is coeval with the discovery of the exceeding velocity with which this force travels through good conductors; and hence, as far back as 1782, we have a M. Lesage proposing to deflect twenty-four different leaves of gold, at the end of twenty-four distinct wires; and in 1787 we have a Mr. Lomond passing signals from room to room, by means of a Leyden jar and an electroscope, experiments useful enough as scientific illustrations, or as philosophical toys, but of no practical value. Indeed, so long as we were in possession of no other form of electric force than that which is obtained in a state of high tension from the joint friction of suitable bodies, there were no hopes, even had man been ready to take up such an invention, of an electric telegraph, pro-perly so called. We find Reizen and Salva at the close of the last century, and Ronalds at the commencement of the present, doing their best to reader this wild and way-ward form of electric force subservient to their purposes; and the latter effectually controlling It within certain limits, and making a telegraph that did some actual work.

It was not, however, until Galvani's discoveries had opened out a new field of electric research, which was so successfully trodden by Volta, when it was found that ecrtain relations existed between heterogeneous bodies, attended always by the production of electric force in a new and much more manageable form; -it was not until this discovery of voltaic electricity that the idea of an electric telegraph became developed with any distinct-ness. We then perceive an advance; and although the applications that first occurred were sufficiently elamsy and impracticable, as compared with the knowledge we now possess, there was enough in Soemmering's decom-posing points, in Coxe's decompositions, in Vorsselman de Heer's electric shocks, and in other original ideas, to prove that the prospect of ultimate success was still entertained.

But when Orrated had discovered that this new form of force, voltaic electricity, had a constant relation to magnetism, and that its presence caused the compassneedle to deflect according to unvaried laws; and when M. Arago had discovered that the same force would endow an inert mass of iron with all the wonderful proendow an inert mass of iron with all the wonderful pro-

review of a magnet, we became possessed of powers, which only reprinted righty to be handled and controlled, which the only required righty to be handled and controlled. Per section of the controlled right and controlled right and controlled right of the controlled right and controlled right and controlled right and controlled right and controlled right of the controlled right and
The Exhibition contains many inventions which are most valuable. Perhaps it would be well to consider here the essential or findamental points of an electric telegraph; they are three in number and are as follows:—

The generation of the force,
 The insulation of the force,
 The utilization of the force.

might be greatly in its favour.
The onlinary add battery has been almost invarially and the control of the cont

does not seem to have been introduced into actual practice. Perhaps the most curious proposition for the conversion of battery power into language is that of M. Botto, whose signals depend on the number of pairs of battery plates employed to deflect the distant needle, and are interpreted.

^{*} At the time of our writing, the wires are being laid from Dover to Caisli, thus connecting the Continent with our system of relegraphic communication; and arrangements are being made to connect the observatories of Greenwich and Paris.

at the receiving station by turning on pair after pair of plates in the reverse direction until the needle comes back to zero, when the number of cells required to do this gives the letter or signal. The idea is original; but in order to carry it out the batteries must be precisely of equal power, and no portion of the force must be last in

The carth itself has been made to furnish a supply of electric farce; in other words, a single pair of zine and copper plates have been huried sufficiently below the surface to be in the wet subsoil, when the earth, asturated with water, represents the sand naturated with acid water, of an ordinary bettery cell; by this means a current of or an oventuary contrery cent; or this means a current of low intensity is obtained, even when the plates are some miles apart. It was thought by some that this feeble current might be made available for telegraphic purposes, by laying one metal at one station and the other metal at another, and very exaggerated propositions were put forth. Steinheil rejected this mode of obtaining the current, which is only available, and that very indiffer-

enily, at the place where both plates are huried.

The means of turning on the electric force, or setting the current in motion, are as various as are the different inventions: in one case, consecutive depressions of a single stud are made, and a current is sent in one direcon only; in another, handles or levers are moved in either direction, and two directions of current ensue; in another, the current is turned on in a constant direction. and the action of the instrument breaks and renews the circuit; in another, the whole force is sent along one wire, or is divided between two, and is directed this way and

that as the case may be. that as the case may be.

The magneto-electric machine is a casstant fountain of force; it does not vary in power, as do batteries, nor ultimately become exhausted, but remains for an unlimited time capable of generating the induced electric manent magnets, and a coil or coils of copper wire wound upon iron cores; the ends of the copper wire being led off to adjustments proper for distributing the fisrce in the right direction. The current is obtained by hriskly moving the coils in presence of the magnet, making, in fact, the conducting wires to more among the lines of magnetic force. Where single currents are required, one motion of a lever ou the other arm of which the coils are fixed, gives an instantaneous current. Where, as in Wheatstone's instrument, a number of consecutive curreots are required in rapid succession, the coils are mounted on an axis which can be made readily to rotate, and to rest at any required point. Where, as in Henley's instrument, the force is required along one or other, or both of two wires, coils are mounted oo levers near each end of bar magnets. Steinheil, Dujardin, and Hatcher are among those who have employed the currents from this source. When the current of high tension, induced from an ordinary current of low tension, is wanted, a cell or two of the more constant form of battery is employed to pass a current along a coil of stout wire surrounded by a long coil of thin wire, which latter is permanently in the telegraph circuit, and out of which is generated the active fores

II. The Insulation of the Force.—This is inquestionably the most difficult part of electro-telegraphy. It has engaged the attention of practical men from the outset. It is in vain that on short our form. is in vain that an abundant supply of electricity is ob tained; it is in vain that the best measures are contrived for turning on this supply, and vain is the expenditure of thought, and contrivances for converting this electricity into a representation of our ideas, if the means are defecinto a representation of our ideas, if the means are defec-tive for conveying it in its integrity to its destination, Electricity of high tension, such as was employed for the early illustrations of signalling, might have been suffi-eirally sell passed by Lomood from room to room, if his wires were carefully suspended, not the atmosphere tolerably dry; but when Roualds proposed to pass the same agent along a distance of only 175 yards, he was compelled to surround his wires by thick glass tubes, well coated with wax at the joints, and placed under-ground in wooden troughs lined within and without with pitch. Frictional electricity, as Is well known, requires

perfect insulation to prevent it passing off in the form of the electric spark. Weber, in 1833, had found the voltain current to be retained in wire of about a mile and a half in length, which was merely suspended from the steepies and house-tops of Göttingen. Steinheil, in 1837, erected and worked his telegraph at Munich, through a distance of about six miles, with no other insulation than a piece of felt placed between the wire and the support; but he found the insulation imperfect, and the more so in wet weather; and saw clearly that the force would have been altogether dissipated, had the circuit been longer.

he suspended wires are, at the present time, occasionally insulated from their supports by glass, but more commonly, as in England, by hard, well-glazed stoneware. Much ingenuity has been exercised in the form to be given to the insulators, of which there are many in the Exhibition. The barrel-shape, pierced longitudinally, universally prevailed here until long circuits called for some more perfect form; and now in the bell or mash-room, the bold, open-mouthed cone, or other analogous forms, we can discover that the actuating idea has been to keep the points of contact dry, and to let the interval between the wire and the pole be a maximum. WALKER (No. 430) has gone a step further, and has placed a closed (No. 3-30) had gone a step further, and nas piaced a closed for of over his insulators. Cases occurred in which it was found convenient, even in the early days of telegraph, to day the wire on near the grounds, and eventually under the public streets, when it was covered with cotton statutated with thar and pitch, and protected by leaden pipes. This was found to be very inefficient, noe did much better assecs attend the use of casuatchone, which was not only expensive, but neither manageable nor durable under the conditions to which it was subjected. durable under the countrions to which it was subjected, By a most happy coincidence, gunta-preba appeared in the market at the time, when resize and varuishes, and the known gunsa had been tried and found vasuishes. It was appropriated by Stemens in Prussia, who employs buried wire very largely, and by Walker in England, who used it at first between Dover and Folkestone, and now extensively in numels and under water, and who demonextensively in timines and unser water, and who demonstrated its value for submarine parposes, by scuding signals to London with two miles of gutta-percha wire (a piece af which wire is exhibited) in circuit, in the sea at Folkestone, in January, 1849. The street wires and transed wires, as well as those submerged in England, Bellumel wires, as well as those submerged in England, Bellumel wires, as well as those submerged in England, Bellumel wires, as well as those submerged in England, Bellumel wires are submerged in England. gium, America, and elsewhere, are now perfectly insulated by a coating of this valuable material. It is applied warm, by a conting of this same material. It is approx warm, either by powerfully pressing it upon the wire, or by causing it to follow the wire through a hole of the given size. In the streets the wires are sunken, and protected hy being enclosed in iron-pipes, which proves to be very necessary, for in Prussia, where they are buried without protection, they suffer so frequently from the attacks of vermin, that it is in contemplation to suspend them as

Under rivers or harbours they are protected by pipes, or are scenred in a mass of timber, or otherwise. In all the tunnels on the South-Eastern line, Mr. Walker has the tunnets on the South-Eastern line, Mr. Walker has laid them in grooved boards, which natched has been since followed by the Telegraph Company, and is also adopted by the Belgian Government on their lines. It is unquestionably the simplest and safest of all methods. The protection required for submarine wires is very great. The wire, by means of which a telegraph com-

great. The wire, by means of which a telegraph com-munication was obtained for n few hours between the coasts of England and France, was not enleulated, neither was it expected to remain perfect for many days. It was clearly not laid down with the intention of remaining permanently, but for some special object. It was a copper wire, coaled in the ordinary way, but thickly, with gutta-percha, and where it reached the shore, protected

by a leaden pipe.

McNam (No. 421, p. 455) has exhibited some excel-

lent specimeus of his process of covering gutta-perela wire, first with cotton and then with an outer coat of gutta-pereba, and finally with lead, in the application of which latter the cotton becomes impregnated with guttapercha from the onter coating.

Wrought iron chain-pipes, with swivel joints, have been constructed by Wishaw (No. 419), and are exhi-

bited an means of protecting submarise wires. Beet shows a sort of errobranch holdes time chains of considerable arroughts, which is proposed to be built about the continuous control of the control of the control of the protected by a strong net-work of wire woren over it, which inguaris great investigat and clusterity, and will often be unminication between Pagistan and Prance, are content for with gatta-perbar, and then witsted negotive, being from in massler, highly covered with rape-yara saturated with its control of the control of the control of the control of the time-wise of the thickness of a quarter of an inch.

A plus worthy of commendation for its simplicity, and for emabling the being occusined and amounter wite. For emabling the being occusined and amounter wite creequits to result any strain to which it night by extremely the contract of the

4. The decomposing powers of electricity suggested themselves to Seemmering. Some twenty or more wires terminated in gold points, within a vessel of seid water, and according as the circuit was made by one or other of the wires, a small stream of gas ascended from its termi unting point, and hence the alphabet. He also contrived that an inverted cone should collect the gas, and would then float and cause a little ball to fall on a detent to liberate a clock mechanism and a bell. Core proposed the decomposition of water, hat gave no plan, Davy im-pregnated cotton with hydriodate of potassa and chloride of calcium, and having marked it off in checquers, securred it on a cylinder that rotated by a clock movement. The current has to be directed through the cotton, and to produce a spot; the checoner on which this spot fell termined the signal. The clock-work was released by an electro-magnet, actuated by a current in other wires.
Bain's printing telegraph depends on the same principle, applied, however, to the decomposition of more sensitive bodies, and reduced to actual practice. He acts upon a mixture of sulphuric acid and prussinte of potash, with which he moistens paper bands. The paper is interposed in the circuit, and receives a mark wherever the current passes and decomposes the solution. The alphabet consists of a combination of short and long marks, produced respectively by instantaneous currents, and by enrrents of short duratico. These currents are sometimes sent by hand, by mere making contact; at other times short and long holes are pauched in a dry paper band, and this is drawn by clock-work between the metal point and cylinder, which closes the circuit, and thus the current cylinder, which closes the circuit, and thus the current is cut off, when the sound part of the paper intervenes, and passes when the presence of a hole allows the point to touch the cylinder, and complete the circuit-the moist paper receiving the spots is made to move an at a like rate. Bakewell places his solution in like manner in a paper band; but he writes his messages with varnish apon tin-foil, and places this between the point and eylinder, and causes the latter to revolve, and hence the current is intercepted wherever the varnish intervenes: the moistened paper revolves at n like rate, and both progress axially, so that a fac-simile occurs of what had

been written.

5. The gulvanometer has been most successfully pressed into telegraph service, and forms the essential part of 'he needle telegraphs which have obtained so marked a reputation in England.

nation in Legipand.
Sciulabeli used one galvanometer coil containing two needles, which carried ink-exps, and made dots as they were selfected. Alexander had thirty wires and galvanometers, the needles of which carried screens and disclored letters on their boing deflected. Schilling, according to one account, used thirty-rix wires, and galvanometers, and, according to another account, only one;

and he had a plan for checking the oscillations of the needle. Davy showed, in 1836, what was apparently a needle telegraph, somewhat similar to Alexander's. Gauss and Weber had a single needle telegraph, the deflections to be observed with a spy-glass. Feehner sug-gested twenty-four galvanometers and their respective wires. Botto's plan of one galvanometer, whose deflec-tions were to be neutralized by an adverse current, has been already named. Mason suggested a single galvano-meter. Galton has published a description of a very complex apparatus, the electric parts of which are three galvanometers, whose office is merely to present needles as mechanical obstacles in certain spots among a train of machinery. Cooke and Whentstone at first used five needles on a lozence-shaped dial, two of which were always used for a signal; and the letter was found where the points produced met. The needle lastrament now in common ass, and in which one or more delications of either or both needles in one or other direction, gives all the combinations necessary for conducting rapid correspondence. The details of these instruments have been much improved, and there is little wanting to make them There is also a single needle instrument, which gives all necessary signals, but not so rapidly. The suceess of the needle telegraph has led to many modifications of the galvanometer. Brett and Little coil the wire on a circular bobbin, and make a crescent-shaped wire on a circums sousing, and more a re-meedle, the poles of which are properly presented to the coil; instead of reading from the prime motion of the acedle itself they read from Indices, which are moved by a tap from the needle. Hightou's galvanometer needle is horse-shoe shaped, and the coil also circular and duly adjusted to the needle. He reads from an index carried on the same axis with the needle. He has also three needles, each carrying a screen, transpierced in such sort that by a combination of motions twenty-six different letters can be exhibited to the eye. Little has ruspended an ordinary needle to the pole of the magnet, and withinside a tube of alcohol. The galvanometer coils

are flat bobblus. are flat bobblus.

The electro-magnet has been used by Bain, Bakewell, Barlow, Breguet, Brett, Cooke, Davy, Dering, Dujardin, Garnier, Blatcher, Heuley, Highton, House, Lotlefink, Morse, Nott and Gamble, Palmieri, Siemens, Smith, Vail, Wheatstone, Wishaw, and others. In the hands of some of these inventors it, has been made to give direct signals; for instance, in Henley's instrument the armature carries the index needle, and the combination of the deflections of two needles gives the alphabet. In Morse's the armature carries a point which impresses permanent marks on paper; it is also connected with wheel-work for moving the paper onward. In Dering's the mag-netized armature carries the index needle. In Dajardia's the armature carries a point that dips in ink and makes Siemen's prints by the direct blow of a hammer entried by the armsture, although his type is brought in by a secondary action. In the hands of others it com-municates motion to the ladex, as in Breguet's senanphore instrument, where the armstore acts upon scapewheels, and gives to the indices the eight positions of the ordinary semaphore. In Nott and Gamble's the armatures carry claws that draw a wheel round, and with it the index, till it points to the given letter. Siemens', the armature acts in a similar manner. also find a third class of instruments in which the motion of the armsture releases a detent, and liberates a clocktrain, the motion of which produces the signals. Cooke and Wheatstone's alarms is sounded in this way, the hammer is some cases representing the pendulum bolt, and in others, being carried on the produced radius of one of the wheels. Brett prints by the successive action of a detent liberating clock-work. It would be no easy task to follow the several inventors through the essential that he follow the secret investments menight are constant to fram some coverger or some many the compared to the constant of
absolutely useless -that many others are too countex for actual service-that some perform badly and with uncertaints that which others accomplish rapidly and suc-

The French Government required signals to resemble those of the old semaphores, and they have extensive We have in England preferred conventional sigpals, thinking it better to train young men to read a new alphabet than to have an index going through the comalphabet than to have an innex going through the com-paratively slow operation of pointing to every letter. In Prinsia the latter plan is preferred. There has been also a choice between reading and printing instruments: In Antorica the latter have prevailed; in England the former. But whatever be the neural sign by which we obtain possession of the ideas transmitted to us, it would seem that the instruments that bave obtained a standing, are, almost without exception, those whose action is direct, and are not the result of any extraneous mechanism

We will now proceed to a careful description of the The Electric Telechaph Company (pd. 477°, 478°)

exhibit many telegraphs. I. Patent 1846, a rhomboidal needle. The galvanometer coil is in two halves, monnted on arms, which are made to open for the reception of the needle, and to close again. On the same axis is mounted the indexneedle that is presented to the eye on the face of the telegraph, and which oscillates between ivory studs. The study are now made moveable, as first proposed by Inc. studs are now made inovanic, as nest proposed my Charles V. Walker, Esq., Telegraph Engineer to the South-Eastern Railway Company, for the occilles to work between, so as to keep the neutral position, by adjustment, half way between them during periods of magnetic disturbance.

II. WHEATSTONE .- The instrument marked " Magnetic-electric Induction Machine," consists of a strong horse-shoe magnet, of eight plates, and 10 inches from either pole to the centre, fixed on a beard; over it is placed a handle, which raises and depreses two coils of soft iron core and armsture. On breaking contact, by depressing the knowle a current of montentary duration posses out from one coil along the wire to the other in one direction. This gives a single impulse only, and always one way: and is used to excite an electro-magnet. and ring a bell.

III. HATCHER'S magneto-electric induction machine to send currents ad libitum, in either direction. This is effected by the same application of coils to a horse-shoe magnet and breaking connet; but there are two handles, and according as one or other is used to break the contact, cross communication takes place. "Hatcher's Cur-rent Director" affords a mode of making and breaking contact by cross communication, as an appendix to any telegraph. In this machine the horse-slove is 12 inches in length, and consists of eight plates.

IV. WHEATSTONE'S potent rotating induction machine for working the disc telegraph (1841). A dial wheel with spokes and letters. Each letter as it is wanted is brought to a given point. The wheels work a pinion, which causes a pair of coils and armature to revolve over the poles of a great horse-shoe magnet. Every letter brought past the given point makes half a revolution of the colls and Invaks, and renews the circuit opposite ways. The currents thus established oud sout off to a distance, pass through coils and actuate local electro-magnets, which alternately attract to and fro an iron plate, and thus alternately release and lock a detent. A clock, driven by a spring or weight, being thus allowed to get at intervals, drives round a dial-hand, click by click, at the other station, and thus imitates the motion of the original dial-wheels. This clock, however, re-quires to be wound up, and it does not seem to provide

for my notice being given when it is down.

V. Bankow's patent, 1815. A printing telegraph, emissing of n circle of letters brought round in succession till the letter wanted comes to n given place; contact

usdock an escapement, and cause a wheel to imitate the motion of the letter eirele. This wheel brings round type panelies, and on coming to ress, a hammer strikes the panels (worked by a coil-magnet), and impresses a paper ribbon, which is drawn uniformly along by clock-

VI. Norr and Gamme's telegraph presents two double alphabets; the one direct, the other inverse, and the digits are many times repeated on a circular dial, having an index, which moves with a step-by-step motion, and is brought to rest at the letter required. The force is derived from the voltaic battery; and current after enrrent is set in action by the successive depression of an ivory key hy the finger; it is made available by means of two U-shaped electro-magnets, acting simultaneously and in the right direction upon two levers, furnished with clicks, which work in a scape-wheel that carries the index, and propel it, noich by notch, as each contact

VII. HATCHER's induced current machine, patent 1847; to produce currents in either direction by one motion of

a handle. Two make and break circuit arcs of brass and ivory pieces, alternating with rubbing-springs, so arranged that when the springs on the right are connect bress and brass, that on the left shall connect ivory and ivory, and rice verse. In either state, a depression of the handle breaks contact of coils of magnets, and throws a shock along the wires.

VIII. COORE's patent, 1845. A portable telegrapi for the guard on a railway to receive messages in case of an accident, hy making a contact with the regular wires

an accident, by manage.

1X. Bart's and Little's patent, A conventional alphabet by needle oscillations, in which the handle at the first station, by working to and fro, establishes alternate the control of the desired station. nately one way or other. There are two needles, but each predie oscillates in only oue direction X. WHEATSTONE and COOKE's patent, 1840. In this

arrangement the rapid alternation of circuits is effected by the dial-wheel turning a pinion, half of ivery and half of brass. The motion of the dial-wheel is imitated at the second station by an escapement-wheel, driven by the oscillation of a pair of deteuts worked by a four-coil local magnet apparatus, alternately urging a piece of soft

iron to and fro. It is an imitation telegraph, and reads the netual letters

XI. HATCHER, 1847; electro-magnet printing telegraph. The usual reciprocating action between coil-magnets, in-stead of carrying round a wheel, makes a series of deta

ou paper constituting a conventional alphabet, XII. Harse' patent, 1846; chemical printing tele-Signals are given by marks arranged in one line of different lengths and intervals by the pressure (on pressure-murinted paper) of a link of iron wire, which deposits prussian-blue, the paper being adjusted by clock-

A Prize Medal was awarded to the Electric Telegraph Company for the exhibition of this fine series of tele-

The Barrish Electric Telegraph Company (No. principle is economy of wire by encircling the poles of a horse-shoe rather than going round a straight magnet. The power gaioed is stated to be as 7 to 1. An improvement is also claimed in the mode of throwing two lines into connection by a single spring and cross bars, so as to halve the risk of a spring breaking. Thirdly, earrying a coil all round a borse-shoe, and thus causing each part of the magnet to act on each part of the coil; but this is in opposition to the first principle, so far as a saving of half the wire is concerned. Fourthly, application of the principle of the arrangement of the letters on the rim of a eighe of the arrangement of the letters on the rim of a dial-plate, not according to alphabetical order, but ac-cording to frequency of occurrence in writing; but arrangements of this kind lawe here in use in printing-offices, on the principle of the more frequent letters being placed the most within reach. Fifthly, a reedy mode of bringing the usedle on the alphabetical-dial to zero, by touching a key. The step-by-step current which works the needle round is thus thrown out of gear, and its power thrown on another magnet, ereating a force which lifts the detents of the escapement, and lets it pass round to the stop in the same direction. Sixthly, is exhibited a very ingenious piece of mechanism for locking the printing-wheel, so that it cannot hy any possibility run on two letters for one motion of the alphabetical needle. Seventhly, since $3^4 - 1 = 26$, the number of letters in the alphabet, and since $3^6 - 1$ is also the number of electric combinations of three oscillating needles; thus-

of which b, be, be is an inactive combination arising from a quicecent position of all the needles; a conventional alphabet may be constructed by a simultaneous use of any three of the combinations, except b, b*, b*, thus, may indicate A; \ / may indicate B; and so on.

Tais principle is worked out by a system of cross combinatious of three batteries, acted on by keys, as in a piano. The key n being depressed brings simultaneously into circuit the three positive currents; b brings into action the positive current of hattery 1 and 2, and throws hattery 3 ont of action.

Another application of this principle to a reading alphabet consists of three pendulums, each carrying screens, with orifices pierced so that by each combination (bringing the screens into twenty-seven different relative positions behind one mother) only one orifice shall be exposed, showing the desired letter. This principle is also applied to prioting telegraphs; thus, no type can be pressed till three conductors compire, and these are directed and ensured by the three positions of the needles, and, which comes to the same thing, by the combinations of the three

comes to the same thing, by the combinations of the three currents creating twenty-seven electro-magnets. HIGHTON, patent of 1850. Use of a permanent magnet to keep up the magnetism of a soft-iron moveable magnetic needle (as a security against lightning destroying the magnetism of this needle), by continually re-magnetism of this needle), by continually re-magnetism of this security assumes the also exhibited. The eirenit-wire, covered only with bituminous paper, is made to pass through a hox of iron filings. This is found

to be insulation enough for the galvanie current, but not for the tension electricity of lightning, which is therefore carried into the carth by the filings.

The use of the secondary battery, the 3s - 1 combination principle, is made applicable to printing, by touching

keys carrying the letters to be printed; and a patented application of the chemical principle, that sulphate of alumina in solution may be advantageously used, instead of sulphurie acid, to keep the hattery in action.

A Prize Medal was awarded to the Barrish Electric TELEGRAPH COMPANY for the exhibition of their ingenious

telegraphs. HENLEY (No. 428, pp. 457, 458) exhibits two powerful compound linear har magnets. The electric force is produced by a semi-rotation of a double electric coil and armature opposite either pole. The movement is extremely simple and nent, and the shock delivered very powerful. It has worked through 560 miles of wire, also through 60 feet of water. Experiments on the Serpentine were made, when several feet of the wire under the water were stripped of the gutta-pereba coating without dissipating the current; and when (as the Jury were told afterwards), on further trial, the wire was divided under the water.

yet the shock passed between the ends sufficiently to deflect the needle effectually. The principle of using permanent magnets as a sub-stitute for a buttery is not new. At Göttingen, in 1839, Sir John Herschel was present when Gauss telegraphed

from his house to his observatory by its means. This is a double-needle telegraph, but the needles move only in one direction. The magneto-current employed actuates electro-magnets, the armatures of which earry the index-needle, and move it as they move. These carrents do not need so good insulation as do hattery

A Council Medal was awarded to Mr. HEXLEY. J. Barry (No. 429, p. 458) exhibits an electric printing

telegraph, which consists of two parts, called by Mr. Brett the communicator or key-board, and the printing machine; thu former is supposed to be at the station from which intelligence is to be transmitted, and the latter, the place to which it is to be seut,

The machinery is propelled chiefly by the power of ciohts, or hy ordinary clock-springs. The motion of weights, or hy ordinary clock-springs. the printing-machine is regulated by the galvaoic current, by means of an escapement, and which requires much less power than is necessary to impel the machinery; thus both the advantage of the instantaneous action of the current, and the greater power of the weights, combine to accomplish the work for which this machine is designed.

The key-shaft is about five inches in length: the finger-keys act upon pins by means of rods and levers. The circuit-wheel is fixed to the axis of the key-shaft, which works upon a hollow axis with ratchet-wheels and clicks, so as to move forward in one direction with the cirenit-wheel. Immediately after it has revolved the desired distance, a number of points, to correspond to the letter or character indicated by the finger-key, and required to be printed by the printing-machine, are released and return to zero, by means of a polley and weights, independently of the circuit-wheel. The type-wheel is so nttached to the key-shaft that a message may

be printed in duplicate. There is another arrangement by which the type-wheel or wheels is attached to a hollow oxis, which carries the type-wheel hackwards or forwards by a pinion occed upon by a train of wheels in connection with it: this train communicates motion to an arbor, to which a disc is fixed firmly: against the disc a ratchet-wheel is placed, mounted loosely on the arbor, between o fixed washer, and adjusted hy a spring-catch, so that it can turn a short distance only on its axis. A slot is cut in the disc of this ratchet-wheel, and also through the adjoining disc, in which a pin works, connected with the tail of o click; this click is so adjusted Therefore, as to earch into the teeth of the ratchet-wheel. when the click is locked into one of the teeth, it causes the type-wheel to travel with the axle and pinion; but when the click is released, the type-wheel returns to zero, hy the assistance of a pulley with cord and weight, or of a spring connected with the hollow axis. A lever is put into action hy a pin attached to the cummon wheel of the printing train of wheels, and by its means the type-wheel is returned to its starting-place immediately after a letter or sign has been printed. Mr. Brett considers this or sign nos ocen printed. Mr. invest considers this arrangement very important, as it insures safety from the derangement to which the type-wheel, by a continuous step-by-step movement, is liable, on account of the accumulation of errors, arising either from atmospheric or other causes. From the momentary effects of lightning or atmospheric influence the machine immediately corrects itself, and the sense of the subsequent correspondence is not disturbed.

The train of wheels which give motion to the typewheel is controlled by means of a secondary train of wheels, fixed to the back of the frame-plate, which controls and reduces the furee of the escapement, and relieves the galvanie or magnetic power required for its regulation. The type-wheel upon this arrangement may have any

desired number of letters and characters without retarding the operation, as they would be so economically placed in the order fitted for their general application. Mr. Hastr has adopted an arrangement of letters on the type-wheel in the order of frequency of occurrence. The arrangement is as follows: - c. f. a. i. a. n. a. h. r. w. a. l. c. f. m. e. n. b, q, p. j, y, k, v, x, q, x. In Mr. Beet's patent of 1845 the key-shaft was worked

length suited to the number of the finger-keys, and the pins were fixed in a uniform belical row, extending its entire length. In the arrangement exhibited, the circuit-wheel is fixed to the end of the key-shoft, as before stated, Connected with this wheel are two pieces of metal, which form the conductors of the current; one of these rests upon the periphery, and the other upon the collar of the estruit-wheel, being olternately upon one of the teeth and over one of the stores. Whilst resting on the tooth it completes the circuit, and when over a space the circuit is broken, and so on alternately.

In connection with the printing train of wheels of the printing-machine, is an eccentric or cam-wheel, which revolves upon the shaft, and is connected with an hydraulic regulator; so that when a piston is raised by the revolution of the type-wheel, a partial vacuum is formed in the valve-chamler, and water passes through holes into the chamler, and momentarily takes off the dead weight of the piston, and some of the friction of the lever, from the escopement. On the type-wheel being arrested, a lever descends, releases the cam-wheel, and the paper is pressed against the letter upon the type-wheel.

Plumbago or vermilion is preferable in use to printingink, as it does not require replenishing for a considerable

Mr. Brett also exhibits a small instrument which he calls a pocket communicator, designed for the use of guards of railways, to communicate with the nearest stotion on the occurrence of accidents, or on assistance being required. In use it is placed in connection with the lines on the railway, and o galvanic battery on the tender, the wheels of the carriage completing the circuit, It consists of an oxle, to which is fastened a ratchetwheel, over which is fixed a circuit-wheel, with seeth and spaces suited to the number of letters and characters required. On its face is placed another ratchet-wheel, which causes the circuit-wheel tu rotate when the click is put into operation, by moving forward a handle, connected with which is a pointer, by which the letters or signs are pointed out.

The arrangement admits of a double eireuit-wheel being employed, for the purpose of reversing the poles of the bottery, and thus changing the direction of the current of electricity.

An electric circuit regulator is also exhibited by Mr. Brett. Its porpose is to give a controlling power over all the stations on any line of electric telegraph, so that any important telegraphic information could be transted to one or more distant or intermediate stotions. without the knowledge of such communication transpiring to any other place than the one intended; the other stations on the line being put out of circuit for the time, wire in connection with a very by means of a separate small apparatus at the different stations. This apparatus it is necessary to construct with a full knowledge of the number and relotive importance of the stations open the line, for the purpose of making the calculotions correctly : it will be necessary to exceeplify this. Take, for examp five stations, - Louden, Dover, Calais, Amiens, and Paris; and suppose the remaining stotions to indicate upon thu dial a suiterant communication with all the five stations, Ten other divisions will give all the changes of one station to another, than: London to Poris, London to Dover, London to Calois, London to Aluiens, Calois to Amieus, Calnis to Dover, Amieus to Dover, Paris to Dover, Paris to Calais, Paris to Amieus and London, Calais and Faris; making in all twelve points or changes.
At each of the stations should be o soull apparatus having n dial, similor to a watch, having indicated upon at the number of points, or the names of the respective stations. At the number indicated a small hand or pointer would show that station which was engaged with outther in the occupation of the line, as all these would be acted upon daneously; and thus any unaccessary interruption would be prevented.

By the use of Mr. Brett's telegraph, communication are made in any language, and printed upon paper with considerable rapidity and precision; the paper and ink are In Mr. Brett is patent of 1844 the acyonists was worked commenced repairing one processors, an appear aims in not by means of o bevelled friction-wheel, set in austion by a self-supplying, and sofficient may be placed in the inpatrain of wheels and a weight. The barrel was made the ratus of both to last for some time. Mr. Brett mys, that the letters may be printed at a greater speed than a wellpractised persons could write them, and that a clerk, after some experience, might manipulate upon the finger keyboard npwards of 150 letters per misute. Mr. Hertt has also exhibited a specimen of the line used

Mr. Hvrt has also exhibited a specimen of the line used in the first experiment, across the Dover Strait, after having been submerged in very deep water for more than aix months, and in part of the isame wire through which the first galvanic current was transmitted from the coast of England to that of France. The experimental line and the strain of the property of the property of guttapercha about five-eighbit of an inch in diameter.

Mr. Brett also exhibits a specimen of wire cable. This a c is a portion of a permanent line, now being laid down cut.

from the Seath Fortisand to Sangaste, new Calaia, the cost of we find in found of four copers wire. No. 163, each of which is insulated and covered with two separate costs of which is insulated and covered with two separate industrial control of the control of the control of the laybeauting of the inner benefits of which, so destroying the and caused the gattle-percha to divide, so destroying the control of the control of the control of the control of the top-the-perchapt of the control of the control of the top-the-perchapt of the control of the control of the top-the-perchapt of the control of the control of the top-the-perchapt of the control of the control of the the formed, is protected by one parlament into wires with which they are completely exceeded, The core than formed, is protected by one parlament into wires of the control of the contro

Mr. Brett also exhibits a vertebrated iron tabular cable, I come when situated in the vicinity of shipping, and may This is designed to protect a cable of submarine tele-tegraphic wires, when situated near the sen-cosst, from without either damage or derangement, as is the following asstaining damage by anothers, or by causalties likely to [Squre.]

One of the iron cables exhibited, is constructed with a greater degree of strength in dangerous situations, as the addition of a chain of links, for the purpose of giving shown in the annexed figure:—

A Countil Medal was awarded to Mr, Blatter, and Countil Medal was awarded to Mr, Blatter, between their their parts, depending, like that of Mr, Blatter, on the development at a distance of the chemical explanation of Provides and State of the Countil Co

screw motion, along a line to the centre of the disc, and leaves traces on the paper as it passes beneath it, in Provisin blue corresponding to the stamped line in the original paper hand, and which may therefore be read off or at lesiner; other preparations, such as that of starch with ciotine, potsab, dee, may be used for preparing the paper. There is much mechanical ingenuity and skill displayed in every part of this apparatus.

A Council Medal was awarded to Mr. Bain.
Barkwart, (No. 433, ps. 43-60) exhibits a copying
electric telegraph, which is fully deserved in the Illustrated Catalogue, with the method of use, excepting the
method of transmitting invisible messages, which is
effected by using paper moistened with distrolled in effected district the control of the control of the control
made on the paper without any mark, the writing living
nabelequently made visible by a solution of the prussiste

of potess.

A Council Medal was awarded to Mr. Bakewell.

WALKER (No. 430, pp. 458, 459) has exhibited a mode

of insulation of telegraphic wires. The great practical a more dead beat, and are less disposed to part with mag-difficulty in telegraphic operations is to overcome the netism. They have not yet been tried in extense; but defective insulation consequent on the dampness of the climate. To speak first of the wires suspended in the open air. Mr. Wulker has substituted for the old form of cone, to which there were many objections in practice, a large open-monthed cone, or rather hollow double cone, so constructed that the wire and the cone should be in contact at the smallest possible surfaces; also that, as the place of contact is as far as possible withinside the cone, t should be as inaccessible as possible to wet; also from its shape, that any wet attaining to the cone would, by mere gravity, run away from the place of contact; also that the part of the cone, where in contact with the wire, should be at the furthest distance from the timber of the ole sustaining all. After suspending the wires, Mr. Walker has the cone covered in with a roof, having sides and ends

The wires from Red Hill to Shalford, a distance of 19 miles; from Ash to Reading, 19 miles; from Ashford to St. Leonards, 28 miles; and from Tunbridge Wells to Robertsbridge, 15 miles, are all suspended in this way, These lines are remarkable for their perfect insulation and good working order. It was feared that the birds would build nests in the roofs, but such, as yet, has not been the case. This plan involves no additional expense,

I, In regard to Taxael Wires,-The deposit of damp and dirt on the suspension apparatus of Mr. Walker tunnel wires, on the South-Eastern Railway Company's lines, as first erected for him, caused so great a loss and distribution of the voltaie force, that without some improvement a total obstruction of telegraph business would provement a total contribution to a graph and and messages to Dover, instead of passing direct, must have been transmitted through an inter-

About the time that Mr. Siemens, of Berlin, was contriving wire covered with gutta percha, it occurred to Mr. Walker to direct Mr. Foster's attention to that sir. Wasker to direct Mr. Foster's attention to that substance, and to request that a specimen should be prepared for him. The result was, that Mr. Foster obtained a patient, of which the Telegraph Company have the monopoly. It was first used in Mr. Walker's tunnels, monopoly. It was next used to suspending, it is now where, instead of the old mode of suspending, it is now where, instead of the old mode of suspending, it is now laid in a grooved board covered in. The grooves are ploughed by machinery; the board is prepared with mineral varuish, and is secured close to the tunnel walls, remaining, when once nulled on, in good working order, and in a perfect state of insulation. This grooved board, simple as it is, will doubtless prove a valuable invention. and those who have felt the charge of badly insulated wires will appreciate the improvement. Compared with wires will appreciate the improvement. Compared with suspended wires, it is important to the safety of trains and passengers. The old wires lave many times been entangled with trains, not only being torn down, but putting the lives of all exposed in jropardy. Several sarrow escapes of this kind have occurred. The last tunned on the South-Eastern Company's lines, that between Higham and Rochester, is now being fitted up with grooved boards; and this board is used on all sustaining walls, of which there are many an the North Kent line; in leading in to stations sometimes down the wall, at other times under the floor. Being prepared by ma-

elinery, it is not at all costly,

II. Compound Needle.—The first telegraphs made were fernished with long coils and needles. Mr. Holmes introduced the needle, now in general use, in the form of a rhombold, with a much smaller coil of silk-covered wire. By means of this improvement, legible signals are abtained through longer distances, and can be conveyed very rapidly and distinctly. But the great inconvenience with this needle is the readiness, as we have already mentioned, with which it parts with its magnetism, losing it by little and little during the ordinary use of the instru-ment, at times suddenly and often totally when lightning discharges occur near the wires. With a view of obviating these inconveniences, Mr. Walker has substituted vacing these inconveniences, are wanter has automatical for it, in the same small coils, an ivery disc, having several short rectilinear needles placed side by side apon-it, and at small distances upart. These needles possess all the good qualities of the rhomboidal; but they give

Mr. Walker has tested them for long periods at important stations, and is now about to use them extensively on account of the serious interruption that has occurred simultaneously in all parts of the country from loss of magnetism. During this summer it was not of unfrequent occurrence to have two or three magnetizers, travelling as rapidly as possible from station to station, in remagnetize; and sometimes before their day's work has ended, demagnetization had again occurred at some

111. Bell Transferers.—This application is not generally employed, and is constructed specially for the chief office at Toabridge. It is for placing the bell, when one part of the line is in use between London and Dover, on the part or side not in use, so that its ring may be heard, and thereby notice given that the line is wanted. By this arrangement the necessity of entting short the communication, or rendering it as brief as possible, is indicated,

The bell and needle being on the same wire, this wire is ent at Tonbridge in the three proper places, viz., between London and the bell, between the bell and the needle, and between the needle and Dover, making six ends. These ends are made to terminate in springs. which rest on brass plates, inlaid in a wooden extinder In one position of the cylinder the springs are connected in the order, London, bell, needle, Dover; so that when talking to Dover, having the line eat off between the needle and the bell, by connecting the wire here with the earth, the bell can be heard to ring, should London send a enrrent along the wire. In the other positions of the cylinder the springs are consected in the order, London, needle, bell, Dover; and similar advantages are expe-rienced in respect to Dover. This plan works well. On the same principle of combination Mr. Walker constructs all his turn-plates, of which he has many varieties : the following is one:-

IV. Branch double Tern-plate.-This apparatus is used at junction-stations for putting branch lines of telegraph in communication with either end of a main line. It is constructed by intercepting the branch wires before they terminate in the earth, and by cutting the main wires and providing springs at the intersections. The springs are so arranged thut, in the normal position of the drum or cylinder, the terminal stations of the main line are open to each other, and the branch line terminates at the junction-station. In another position of the drum, the London terminus of the line is connected with the branch line, and the wires from Dover end at the searction-station. In a third position of the drom, the Dover terminus is in connection with the branch line, and the wires from London end in the junction-station. This is in daily use at the stations on the line, and acts well,

V. Lightning Conductor. — This consists of a small hollow metal cylinder connected with the earth, its purpose being to conduct away the discharge. The line-wire, in its passage from the railway to the telegraph, passes within this cylinder; traversing which it is first presented to the inner surface in the condition of a thick wire, furnished with spars, whose points are in the closest possible proximity to the cylinder, without being in actual contact; it is then continued on and presented as a short coil of very fine wire,-finer, in fact, than that of the instrument coils, wound on a bobbin,-the outer convelation of the coil being very close to the cylinder. Thus a better means of escape is presented to the lightning than is to be found in any part of the instrument, contion is to be some in any pactor in instances, con-sequently it always escapes by this conductor either through the points or by huming the fine wire. As yet no instance has occurred in which these conductors have failed to act, and to preserve the instrument; while instruments in the same office, not thus protected, have on several occasions been damaged.

VI. Graphite Battery .- The ordinary telegraph battery consists of plates of aumigamated zine and clean copper, in cells filled with pure sand, saturated with diluted sulphuric acid. The majority of telegraph latteries are in actual use during a small portion only of each day.

remaining at rest for the remainder of the twenty-four hours, ready for use and in good working order when required. During this time of inactivity there is a continuous slow action between the diluted acid and the copper, whence is produced sulphate of copper, which in its turn becomes decomposed, and the copper released upon the sine, indices local action, greatly reducing the power of the battery and destroying the aine, so that it requires to be changed and cleansed more frequently than would otherwise be the case. To obviate this, Mr. Walker songht for a substance that might possess the good pro-perties of the copper-plate, but which should not be acted upon by the acid. The corrosion deposited on the inte-rior of old gas retorts is admirably adapted for this rior of old gas reforts is admirably salapted for this purpose, and be has had it cut into plates by circular saws, worked by steam machinery. He has preserved the history of a 12-plate battery, which was connected up to do telegraph daity, where the waiting-time was very great as compared with the working-time. It was charged in the usual way, with diluted sulphuric acid, on April 5, 1849, and remained efficient till the middle of February, 1851, without having been washed or having had the sand changed. It was supplied with about a dessert-spoonful of acid water twenty-one times during the above period of ninety-seven weeks, and six times with merely warm water. It suffered most from mere with merely warm water. It billiered files from severe evaporation; in some cases it did duty for thirty-four, thirty-nine, and forty days, and in one instance for seventy-seven days, without having been touched. On September 15, 1851, it was dusted and had a little acid water poured in, when it still gave a feeble working

Will. Merodo Such.—This is a very simple armagnet, and originare will Mr. Walker. The audits of two small freezy stude. In the year test there were many susperier increase and other harmanic conditions, either direction, and often faired up to the stude, so either direction, and often faired up to the stude, so upprope of signalling was been for the student propers of signalling was been for the student propers of signalling was been for the student of
pany have adopted it. VIII. Ringing Handle,-This is used at stations where the bell has a distinct wire to itself. It enables an inter-mediate station to send the electric force in the direction only of the station whose attention it is required to call. This improvement is Mr. Walker's, as are also the essential details of the apparatus; before the introduction of which it was found difficult to keep the circuit good. The line wires are cut between the ringing key and the bell, and strong springs are inserted, which press on brass studs and keep good the circuit when the apparatus is in a state of rest. To the handle is attached a moveis in a state of rest. To the handle is attached a move-able cylinder, furnished with two strong stude in proper connection with the respective poles of the hattery. By moving the handle, one of these studs, and consequently one pole of the battery is put in connection with a strong brass boss, connected by a wire with the earth, and the other stud, according as the handle is moved to the right or to the left, raises the spring on cither side the bell, and sends the current up or down the line, as the case may be. This arrangement is used throughout the South-Eastern Company's lines, and works well.

A Pinis Medial was warded to Mr. Wakkens.
A Pinis Medial was warded to Mr. Wakkens.
A Laka's Patent (No. 2011, p. 431) consists of a circular
dial plate, arranged in a sloping position, with an alphabet and a pointier, which by a handle is brought round to
the letter required; at the same time it makes, breaks,
and reverses the current. By this means the pointers
on the second or telegraph dials are made to indicate the
same letter at distant stations. The chief feature is the farm and disposal of the many-podel perments magnet which works the rachet-wheel arrangement, thereby giving motion to the pointer or index; of the telegraph. The power in this instance or index; of the telegraph. The power in this instance of the projecting the telegraph of the power in the instance of the projecting let very thereton, the projecting the very thereton, and the projecting let very thereton, the projecting the very the projecting of ungaractical as to act calcertrictly in conjunction with the poles of the temporary magnets; by this means the frame acting reasonable projecting the projecti

To impart a rapid movement to the index-hand, this current changer is formed of three metallic dires, insulated from each other, and so arranged as to the number of letters on the dia-plate, that the current is made, broken, and reversed accordingly, and causing the index-hand to poss round at once to the letter required, with great rapidity.

Affair a world referrable consists of four electric eglander only, placed between the arm of a map-poled lamber only, placed between the arm of an amp-poled magnetized to as to possess the state polarity, that when the current passes through the cells, the conservation of the contract of the current, thereby gridus according to the novement of the current, thereby gridus according to the movement of the current, thereby gridus in forming magnets out of one piece of steel, with any massler of poles required, and picture poliner-coin, or massler of poles required, and picture poliner-coin, or massler of poles required, and picture poliner-coin, or and company, and the are presely disministed recisance and company, and the are presely disministed recisance to the policy of the current passing is within effective is to placed that the current passing is within effective.

innerver or a majorite poer, soon is seen, which was to addressly the action, too, being direct, likewise prevents the loss or waste of the current power.

The great advantages gained by these combinations are shown by the fact of there being surplus power sufficient to overcome the frietien of the artective armapement, without the assistance of weights or common needle telegrands power as the common needle telegrands power may be proved to the common needle telegrands now in unexp power as the

ing secret signals without extra wires; viz., signals which shall be read off only at given localities without passing along the whole line included in the primary wire, This he has accomplished by placing at each station a step-bystep revolving disc, included in the primary line of wire, but so arranged as not to be set in rotation except by a galvanic force greatly superior to that which makes tho ordinary signals, or, when only enrents in one direction are used for these signals, then, by the reverse current. This disc, being brought at every station to correspondence in point of position with its position at the initial station, made by a system of non-conducting interruptions to the enntingity of its elreumference to establish a break, according to its position, cross connections, or short cuts by which the signal current can pass (and therefore will which the signal current can pass (and tnerebere will pass) from our point to another of the primary line of wire, without running through the length of wire con-stituting the local working coil of the station, so that the working of the telegraph at that station is temporarily suspended, the electricity finding for a time a shorter and easier passage. Besides this ingenious con-trivance, Mr. Dering has exhibited modes of preventing the disturbing action of atmospheric electricity and the

Mr. Dering considers-I. The steel best suited for the electric magnets is that employed to form the balance-springs of watches II. As regards the mode of suspension for single telegraphic accelles, instead of suspending the accelle in a round hole by a round pivot in the middle, or nearly so, round note by a round pivot in the inddile, in ready so, Mr. Dering finds it in all cases better in practice to use a triangular-shaped hole at the spper cod of the needle, with a round pivot on which to suspeed it. This allows freedom of motion quite sufficient, whilst it entirely checks wibration. The instrument on this principle exhibited, shows the great rapidity in the change of place of the needle combined with freedom from vibration,

III. By a peculiar arrangement of coils for producing motion in telegraphic needles, with the same number of convolutions, the total length of wire is lessened, and thus the battery force required is diminished. IV. In the apparatus for the transmission of secret

messages, by throwing stations out of the line of commu-nication, there is a means provided of instantly restoring the revolving discs at any moment desired, and from any

position, to the starting point. V. In case of a telegraphic needle being deflected by the aurora borealis, or other slight atmospheric influen Mr. Dering places in the circuit of the line-wire a battery of sufficient force (regulated by the number of galvanic elements) to counteract the disturbing influence, and thus restore the needle to its ordinary position of equilibrium.

VI. An instrument for protection against atmospheric electricity is also exhibited, as described under the eighth hend of specification in Mr. Dering's patent. In this the size of the balls may be increased to any extent, provided their distance from the opposed plates be in a proper pro-portion diminished. This would prevent the chance of The destruction of any part of the safety apparatus.

The Jury considered Mr. Dering as descring of very Honourable Mention for the great ingennity he has dis-

played in these inventions.

Barry (No. 422, p. 455) has exhibited a patent electric telegraph alarum-bell, bell-handle, and battery. The various letters or numbers represented on the face of the dial of the electric telegraph are made by the motion of either or both of the indicators, the number of which motions for each letter or number is defined by the figures on the centre of the dial, commencing at all times with the indicator on the side next the letter or number, and when both indicators are used, finishing with the opposite one. The belies being double and of a circular form, the greatest amount of electricity is conevotrated in their centre, and the magnet being in the form of a ring or horse-shoe, suspended in the centre of the believes, its poles are acted upon by the maximum amount of force, by which great certainty is attained, and the magnet is deflected to the right or left according to the direction taken by the current. The poles of the magnet being equidistant from the earth, the magnet is rendered static, and is not affected by terrestrial magnetism.

LITTLE (p. 455) suspends a common sewing-needle within a tube containing alcohol by means of a permanent magnet at the upper end, so that it can deflect without friction, and does not jar against the electro-magnetic coil on either side which deflects it, while the permanent magnet keeps up the magnetism of the needle. ALEXANDER (No. 426, pp. 455, 456) exhibits a model of an electro-magnetic telegraph, described in the Illu-trated Catalugue. It is interesting as representing an early development of the idea of a needle telegraph, It bas 30 line-wires, 30 galvanometers, and 30 seedles; the Intter carrying each a paper-screen, which, when moved, unveils a letter, &c. The galvenometers are not calculated for actual work in real practice; and, as only one wire is used as a return wire, common to all the galvanometers, there must follow a distribution of electricity among the rest of the wires, fatal to real signalling. The earth is the return circuit in all practical plans, Surin (No. 424, p. 453) exhibits a comic electric tele-triph. This is a three-wire telegraph, and the author

ousiders that, by three combinations, all that is necessary in telegraphic communications can be performed.

McNata (No. 421, p. 455) exhibits specimens of electric-conducting wires for subsqueous purposes. The process of making this wire is by first placing a coating alternately of gutta-percha, or caoutchour, and braiding of cotton-thread, till the enaulation is of a given trick. ness: after which it has an outer coating of gutta-percha, and is then placed down a kollow mandril, and by means of a great hydraulic pressure, a lend covering is placed around it, embracing it so firmly that the whole is one compact body. This article seems to answer its purpose well; and, although there were many specimens of subaqueous wire in the Exhibition, yet, for the most part,

their base is Mr. McNair's wire. Whishaw (No. 419, pp. 454, 455) has exhibited wellmade gutta-percha tubes, furnished with ivory month-pieces, useful for talking across rooms, or in a railway carriage, or for deaf persons: an early specimen of guttapercha tabing and lathe-bands: submarine, insulated electric copper wire, covered with gutta-percha, braided with linen, and painted or variabled. These specimens would not bear the wear and tear incident upon the knocking about they would meet with. A long wooden box, to be used as a battery protection; a private cealer box—this is a box with a sloping front perforated with slits; letters are arranged vertically on the side, and harizoutally on the top. Within the box are us many rollers as there are slits in front, around which are wrapped long bands of paper, each Laving a communication printed thereon, and repeated many times. The end of each band projects so that it may be easily drawn ont. By looking at the two letters curresponding with those sent from the Telegraph Office, the consumulcation is at once discovered. A model to illustrate the hydraulie telegraph. The hydraulie telegraph was invented in the year 1837, and from that time there have been several modifications; some have been furnished with fleats and indexes earrying letters, &c., some with floats and metal-rods, which, on being either elevated or depressed, point to letters, &c. A reservoir for the supply of the water, and a tank for the waste are required at each station. In the model exhibited, a syphon-tube shows the application of the water itself, which rises and falls in the tabes by opening or closing the respective cocks. Patent plans tubes, to insulate and protect the wires of the electric-telegraph when placed under ground. The use of these would be found to be expensive, and probably, hazardous.

Patent multi-tubular pipes, of glazed earthenware, well-made; their use is to insulate and separate the wires of electric telegraphs when placed under ground. Pro-bably these would be perfectly insulated with gutta-perena wires, but, if broken, there would be some difficulty in replacing them. The desiderata are, great darability

and great accessibility. Wronght-iron pipes, with ball and seeket joints. length of each pipe is 2 feet, and allows an inclination of about 10 degrees, forming a subsqueous chain for rotecting electric telegraph wires when under water.

This arrangement seems to be good. This completes the British portion of the exhibition of electric telegraphs, and from it a very good picture of the English systems of telegraph is presented. One out of the only two specimens which have been sent from shroad is that of Siemens and Halske, Prussian system, and which we proceed to describe:—
Stemess and Halske (Prussa, No. 310a, p. 1067).

The telegraph exhibited by these inventors is extremely ingenious, and the construction and details are very good. It differs essentially from all others that have fallen under nur notice, in that signals are made by arresting instead of by causing, the passage of electric furce. consists of three ports,-an ularum, an indicating dial, and a printing arrangement. The force is derived from voltaic batteries. Datiell's constant battery is employed. twenty-five pairs of which, at each station (for the but-teries at both communicating stations act in concert), are said to act through about 250 miles of wire. The force, in all cases, is made available by means of electromagnets. And first, in respect to the arrangement, when no communications are passing, but the stations are each in a condition to receive notice that they are required to attend.

The bells alone are left in the circuit. When a current passes along the wire, the keepers of the electro-magnets, which are on one arm of a lever, are attracted, which causes a small hammer on the other arm of the lever to strike a hell. The clerk who desires to call attention turus his own bell out of circuit, by moving a lever, and, at the same time, turns his battery and his telegraph in strangest into the circuit, and then leaves them. This allows the electric force to have free course, and the distant bell to ring; but the electro-magnet of the alarum is so odiusted that the circuit becomes broken the moment the armature leaves its normal position, which it does by the attraction of the magnetism; the magnetism, therefore, ceases with the cessation of the current, and the armature returns again to complete the circuit; and so on, alternately, producing a succession of blows upon the bell. During this time, the telegraph instrument of the first station, although in the circuit, is perfectly inactive; being so arranged that its electro-magnet is much less sensitive than that of the alarum, its armature re-quiring more electric force, or more time to acquire motion, so that the circuit is broken by the action of the alarma before the telegraph has been able to move. When the sounding of the bell has gained attention at the distant station, the officer in charge there turns his alarum out of circuit, and introduces his telegraph instrament and his buttery. There are now in crecuit a bat-tery, and an instrument at each station, which are so arranged that the two batteries combine to produce a eurrent in one constant direction, and, hence, both act simultaneously on both instruments.

The instrument process a circular dial, around which are engraved the letters of the alphabet, or other conventional signals, and is furnished with an index, which, under the conditions above named, continues traversing the circle at the rate of about thirty times per minute. The two (or more, as the case may be) instruments act

precisely in concert, which is thus accomplished:—
The armainre of the electro-magnet carries a lever, at the end of which is a claw; that advances one tooth of a ratchet-wheel (mounted on the same axis with the index) at every attraction. But this armature breaks the circuit at each attraction; and the magnetism censing, it is returned to its normal position by the action of a slight spring, again to complete the circuit, and to draw on one more tooth of the wheel, and cause the index to nd-vonce, and so on. All things being in order, the alternate making and breaking of the circuit are simultaneous on each instrument, and the indices of each point to similar letters at the same time. In order to turn this prrangement to account, the dial is surrounded by a circle of pressing any one of these do an, it impedes the progress of the ratelet-wheel just at the time when the circuit has become discontinuous, and no current is passing. The index, therefore, of each instrument rests at the letter in question, and continues its course only when the stud is allowed to return, and the wheel is liberated.

stell a showed to return, and the wheel is illemented.

priming before Mr. The rethree-wheel for firmished with the priming before the priming before the priming before the rest. Here the stellar forms the rest of the rest. Here the stellar the rest of the rest. In the receivable of the rest, the rest of
to prose the payer against the blackward cylinder, which prints the form of the letter. Letter after letter is thus printed, and a blank is touched at the end of each word. When the blanks are struck, the leannare, noveling with no restaurce, moves a little further, and enables a visit to restaurce, moves a little further, and enables at the end of every word. At the same time that the hammer at these a letter is break the error of a bell is heveral at the end of every word. At the same time that the hammer at these as letter is break the error of the puring magnet, and thus the breaks the circuit of the pruning magnet, and thus the breaks the circuit of the pruning magnet, and thus the breaks the circuit of the pruning and the properties the latter is likevine provided in Riverie provided.

The lever that earries the hammer is likewise pravided with arrangements for advancing the paper the width of one letter as it returns in its position of rest, so that the letters follow in due succession; it also advances the blackweat eyilonder in the direction of its axis, so that it shall not become exhausted by always printing from the same surface.

There are other arrangements provided for facilitating the transmission of electric force to long distances, and for overcoming some of the difficulties that occur in practice.* A Conucil Medal was awarded for this benatiful

system of telegraph.

The remaining foreign Exhibitor—
Stöhrer (Sexony, No. 15, p. 1105), exhibits a magneto-electric telegraph. It is applicable to the ordinary

nes of telegraphs. In practice the hand always turns the same way. Attached is an alarm bell, which is readily put in and out of connexion.

A Price Medal was awarded to Mr. Stöhrer.

Domestic Telegraphs.

Brauerr (No. 423, p. 450) los exhibited a domestic hergriph distripted to respected the use of bells in the hergriph distripted to respect to the use of bells in The nacions intelligence of the control of the Theorem and the control of the down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be down the lever at the foot of the dail; but, should be at the dawn the lever at the foot of the dail; but, should be at the dawn the lever at the foot of the dail; but, should be at the dawn the lever at the foot of the dail; but, should be at the lever at the foot of the dail; but, should be at the lever at the foot of the dail; but, should be at the lever at the foot of the dail; but, should be at the lever at the foot of t

the mad rapidity.

Winstaw (No. 419, pp. 454, 455) has exhibited a donestic telegraph. The dial, which has an index hand affixed to it, has also engraven upon its face a number of short sentences or written orders for requisites, such as ore likely to be called for in the establishment to which the telegraph belongs. The index points to any one of these seutences as required, the communication

is at this moment between the hammer and the paper band. The armature, being powerfully attracted, causes the hammer to strike a suart blow spward, and then Telegraph, Britischweig, 183a.

Thus

being established by means of wires and cranks in con-

nexion with a clock movement. Brooks (United States, No. 222, p. 1450) exhibits a bell telegraph for the use of hotels, &c., consisting of one bell, with a series of springs; it seems well adapted for

its work. HOWLAND (Uoited States, No. 486, p. 1465) has exhibited a bell telegraph for the use of hotels, dwellingbouses, steam-ships, &c., and is designed to avoid the complication of bells necessarily cuployed in large establishments. Each signal on the dial of the instrument is distinct, and remains faxed until reflered by an attendant. It may readily be attached to the usual arrangement for bells. It is ornamental and requires but

Chemical Apparatus.

A very small number of manufacturers have contributed to the Exhibition, and, with the exception of QUENNESSEN (France, No. 1683, p. 1257), and STAFFEL (Russia, No. 148, p. 1371), no great preference can be given to one or the other of the principal Exhibitors. It may, however, be mentioned, that, more or less, the chemical glass and china apparatus, made by German manafacturers, have china apparatus, more by overnous manuscross, sore been exhibited by the majority, which indicates its adaptation to practical use, as might be expected from its greater lightness and durability.

No new invention, except that of Mr. Staffel, nor any new application of known construction of apparatus, is

little space.

KNIGHT and Sons (No. 453, pp. 462, 463) exhibit a KNIGHT and SOSS (No. 423, pp. 462, 483) exhibit a chemical cabinet, containing apparati for laboratorics, graduated cylinders, jars, blow-pipes, an improved bellows, paesumatic troughts, chemical testa; lamps, re-torts, and other glass articles; apparati from iron and carthewaver, arranging firmaces, mortars, &c., being a complete set of articles in daily use by the practical

This cabinet is intended to combine usefulness with economy: it is proposed that such cabinets should be fitted up with apparati and tests for the agriculturist, the analyst, the commercial man, and the student, with the analyst, the commercial man, and the student, with the prices attached to each article, so that the amount of the first outlay being under control, the ultimate expense may be known with certainty, and the difficulty of selecting appropriate and useful apparatus avoided; as necessity of devoting an entire room to the well as the purpose. This cabinet promises to be highly useful.

A Prize Medal was awarded to Knight and Sons for

their chemical cabinet. Knight and Sons also exhibit a chemical furnace on the same principle as that of Dr. Black, which is con-structed of stout sheet-iron lined with fire-bricks, and in

applicable to nearly every purpose for which a furnace is required: one sand-bath, stoppers, crucibles, muffles.

Knight and Sons also exhibit a galvanic battery, according to the arrangement of Daniell, consisting of a series of six cells, each holding a copper cylindrical ressel, to be filled with a solution of sulplante of corner. in the centre of which is a porous tube, filled with diluted sulphuric acid, and containing an analgamated sine rod; also a battery on Grove's arrangement, consisting of a series of six cells, each emprising a glass vessel, containing an analyzmated zinc plate, to be filled with diluted sulphuric acid, having in the centre a flat porous cell, with a platina plate, and filled with nitric acid; also another battery on Green's arrangement, consisting of a series of aix cells, each comprising a glass vessel, coa-taining diluted sulphuric acid; to each cell is a series of three plates, the centre one being of platinised silver plate, and the others amalgamated sine. These plates are connected to one rod and can be easily raised out of or lowered into the liquor, A galvanic lattery, on the Maynooth arrangement,

consisting of a series of ten cells, each being a cast iron trough, filled with diluted nitric acid. In each cell is placed a porous cell, charged with diluted sulphuric acid, ontaining an amalgamated zinc plate

A galvanic battery, consisting of cells formed of gutta-

percha filled with sand, saturated with diluted sulphuric acid, each cell containing a copper plate, and one of

analgamated zinc. GRIFFIN (No. 457, p. 463) exhibits graduated glass in-struments, applicable to the examination of carbonate of soda and carbonate of potash, of all degrees of impurity, ammonia, sulphuric acid, muriatic acid, acetic acid, and vinegar of all strengths, blenching powder, and bleaching liquors generally; the graduation of these instruments is executed on the principle of assigning a fixed volume to the atomic weights of each chemical compound when in solution, and so producing a series of equivalent test liquors. The standard is made on the consideration that none. The scandard is usue on the consideration than 100 grains of oxygen, in a deci-gallon of solution (being in the proportion of 1,000 grains in a gallon), at the temperature of 62 Fahr, produce a solution of 100 which represents a quantity of any chemical substance equivalent in 100 grains of oxygen, or its atomic weight expressed in grains, contained in a deci-gallon of the solution.

503.38 grains of hydrate of soda, 667.34 grains of subydrous carbonate of soda,

1793.13 grains of crystalline carbonate of sods, dissolved respectively in water, so as to make a decigallon of solution at 62 Fahr, are of the same chemical strength In like manner

> 643-19 grains of anhydrous acetic acid, 455-13 grains of anhydrous muriatic acid 501 · 165 grains of anhydrous sulphuric acid,

2028-64 grains of mitrate of silver, brought into aqueous solutions of the above hulk at 62° Fahr., are all solutions of 1000 of chemical strength. The extreme convenience of this system carried out in a laboratory in respect to the saving of time, thought, and calculation, and its power of securing uniformity of manipu-lation, must be obvious to every chemist,

The graduation of all the glass measures applicable to ese investigations, as well as all othera exhibited by Mr. Griffin, is exceedingly accurate and good, the divi-sions from 10° to 10°, being performed by Ackland's graduating machine, which gives correct aliquant parts. The unit of measure, to which the small measure, called Inc unit of measure, to which the small measure, called pipettes and alcalimeters, is referred, is termed by Mr. Griffia the septem, by which is meant the bulk of seven grains of water, at the temperature and under the barometric pressure at which the insperial measures are regulated: 1,000 septems make a deci-gallon, corresponding ing to 1 lb. avoirdupois of distilled water, and the tenth part of an imperial gallon of water. The septem, therefore, is identical with the milli-gallon,

Mr. Griffin exhibits a set of decimal weights and measures founded on the imperial gallon and the 1 lb, of 7,000 grains. This Exhibitor, in addition, has given a rich collection

of objects, for the most part similar to those exhibited by No. 453, consisting chiefly of apparati for making assays with the blow-pipe, mineralogical boxes, a large collection of graduated glass apparati, applicable to various purposes, boxes fitted with chemical tests, alcalimeters, saccharometers, arouncters, la the arrangements made by Mr. Griffin for special purposes, everything necessary has been included, to the exclusion of all else, with especial reference to economy and convenience.

A Prize Medal was awarded to Mr. Griffin.

Enwards (No. 438, p. 461) has exhibited retorts, phials, and capsules, covered with an electrotyped precipitate of copper, to protect them against crucking by heat; all these articles are good. The covering of glass vessels with copper is not, however, new; but its use would appear to be very little known in England, The Jury considered Mr. Edwards deserving of Hoourable Mention.

Interson (No. 459, p. 463). Illowing apparatus, con-structed with two circular bellows, for the purpose of a continuous blast,

STATHAN (No. 456, p. 463). Boxes fitted with chemical tests, in various sizes, parenmatical troughs, &c.

Bakea (Nu. 396, pp. 451, 452) exhibits a succlarometer and herometer; but it is to be remarked, with respect to the former instrument, that the optical analysis of sugar surrosses all other modes.

Currer No. 63-15, 6-63 exhibite chemical apparatus. It as few square feet are comprised the means of perfuring rooms of the most important and troublessome operations of the intervalone. It exists as a still cort steamer tracts, expansions, steam-shalls for retors, still, acc, dying-closed, no condenser for steam, and worses for other skills, the elaminer contaming them acting also as a store and condensing role. CHUMBO (France, No. 123, p. 1177) exhibits a gazoscope, an apparatus so constructed as to indicate the presence of hydrogen gas, when in an atmosphere containing only 11st part of this gas, that is to say, 1 part of gas to 179 uf atmospheric air. In the year 1843, sevenal engineers were appointed to

test the gazuescpe, in the coal-mines of St. Metons, and they reported favourably pone in efficiency in preventing explosious of all kinds during the time of trial, vir, during the months of October, November, and Dacember, 1843. According to Srt Humphry Davy, the proportion necessary to an explosion in shout 4ph; and, comecessary to an explosion in shout 4ph; and, comelection in the control of the conleter on the control of the control of the conleter on the control of the control of the conleter on exclusion could take play.

M. Chard also exhibits a new activy Jamp, which has been made at the expose of the Band of Health at Paris, for the ase of establishments containing spirits, essences, ether, or any kind of volatile and inflammable substance. It possesses the advantage of having no wire game and it filled by a tube. It extinguishes itself when the game to become explosity, and in inexpensity. The construction become explosity, and in lenguage the day my greet (in a burning bown patients) their not being at likery to describe the control of th

The Jury awarded the Prize Medal to M. Chnard for his safety-lamp.

Bonner (France, No. 1096, p. 1230) has exhibited an assay furuace and a small assortment of crueibles of white clay. Also a small melting furnace, remarkable for the faculity with which it can be taken to pieces and cleaned. DEVECE (France, No. 476, p. 1200), has exhibited a large and complete assortment of atensils of the same description.

LEGOLT (France, No. 303, p. 1191) has exhibited a galvanic hattery, patented in France and England, in which zine is combined with a preparation of carbon

uggintinated.

KAPEALER and Son (Bavaria, No. 28, p. 1099) have exhibited black-lead crucibles, for melting gold, silver, iron, stock, &c. These crucibles have a high reputation

iron, steel, &c. These cruechies have a high reputation for supporting with security the highest temperatures, such as are requisits for sinching iron, steel, &c., and which is due to the introduction of a five-proof errogathway of the such as th

SERL, Jun. (Prusia, No. 483, p. 1078), has exhibited a remarkably complete and beautiful steam uppartus, fitted for chemical and pharmaceutical purposes, with still, digesting, and evaporating vessels, and cases for drying and filtration, at single temperatures, in German silver, and which may be considered one of the most complete things of the kind in the Exhibition. A Pine Modal was awarded to Mr. Seed.

social was a sense to \$97, \$775, \$1,000 has exhibited a good assortment of chemical spagarata, crucibles, eraporating basins, funets, &c., made of white clay from Thrungue Forest, unch resembling, to appearance and quality, our Wedgewood ware for similar mea. In particular may be noticed the great size of some of the vessels, such as a cylindrical one 2 feet in depth and 15 million of the control of the cont

in diameter, Grussia, No. 854, p. 1096) has exhibited a carbon battery, in which the zine rods have for their section a rectangular cross to expose a greater surface, and the exterior cylinder is composed of carbon powdered and strongly agglutinated by sugar, it is understood, or other ascelariue cement, so composed as to dissorbe with extreme allowness.

Dr. Reinkort (Zwichrieken, Bavaria, No. 831) has exhibited a galvanic battery of his own invention, in which a rine cylinder surrounds one of eartherware full of powdered coke, It is used to excite an electromagnetic apparatus.

Kisterlinken (Wurtemburg, No. 26, p. 1115) has exhibited a silver hydrometer.
Wolsy' (Wurtemburg, No. 13, p. 1115) exhibits various chemical apparatus and gradnated vessels for measuring fluids. Honomable Meution was mwarded by the Jary to. Mr. Wolff for his pharmaceutical apparatus for dis-

tilling.

Leiurus (Prausia, No. 83, p. 1053) has exhibited a rehe collection of pharmacepitied apparetus: Imaps of different lands for coloning calciung, distilling; gasometers mortars, machine for making pills, platine crucibles, an apparatus in platina for preparing hydrodenoic social simple apparatus for securities for secretaining the quantity of super in selection plating platine for preparing its relation to proper and thousand the second plating and the plating of super in selection plating and the second plating and the selection of chemical apparatus the Jury voted a Price Media.

Devining gass works. For ims vanishing tendencies of chemical apparatus the Jury voted a Prize Medal.

Barax (Austria, No. 135, p. 1014) exhibits boxes with chemical tests, kamps, retorts, supporters in wood, alko-meters, various kinds of apparati made from Rohenian glass, and a test apparatus for beer, after the design of Professor, Steinhell, of Vicuna. A Prize Medal was

voted to M. Batka.

Branzers (Austria, No. 133, p. 1014) has an apparatus
for the chemical analysis of beer, invented by Professor

Balling, of Prague.
STAFFEL (Russia, No. 148, p. 1371) exhibits an apparatus for assaying precious metals.
This invention of Mr. Staffel is intended to supersede

nis investion of Mr. Statlet is ratended to supersede neither the solution by fire, nor the various chemical tests which have been brought to a state of great perfection; it is simply designed for practical purposes,

when neither neids nor fire can be made available. apparatus is constructed on the principle of spe mucity, which has been extended to specific rolume. The great difficulties to be contended with were, 1st, the elasticity of the air; 2ndly, its temperature; 3rdly, capillarity; 4thly, the closing of the apparatus hermetically; and, 5thly, the furnashing a scale for various weights; but after four years of unwearied study and labour Mr. Staffel overcame these difficulties. The apparatus consists of a glass tube, fixed in a brass case, the bottom of which forms a cylinder, which receives its movement by menns of a screw. An annular dial, furnished with a hair, for an indicator, shows the degrees from 0 to 99. and controls the motion of this serew. The degree from 100 and upwards, are indicated on a plate, fixed at the side, which plate stands in counexion with the dial, The glass tube is closed hermetically at the top with a glass cover, to which is annexed a capsulo, a perpendienlar glass cylinder, and two brass bars, serving as a

which is able of the apparents in a lart by manus of which the dills obsequent to zero, and at the cases timewhich the dills obsequent to zero, and the time the time to the normal point. The object to be tweed in the explicit by mean of weights adapted to the purpose; and within the final, and the exposic correlally choice. The time final, and the exposic correlally choice is a second proposition of the contract of the con

24 - 8 = 16,

which will give the standard of the gold.

If the gold he alloyed with silver and copper, which
will be indicated by the peleness of the colour, it will be
necessary to refer to the hrass bar for the purpose of
showing the alloy. The differential weights of the alloy
between gold and copper, and between gold, silver, and

copper, are indicated by various scales.

If the object weigh 30 grains, and the cylinder show 11, then the result will be

$$\frac{39-11\times 24}{39}$$
 = 17-23 proof.

The volume of fine silver or gold is marked . F; The volume of experience of any other alluy is marked C_1 . The volume of specific difference is marked . D; The volume of weight is marked . . 1, 2, 3, &c. If a fusion of $28 \, F + 11 \, C$ is to be mude, the figurum to the F = C - D, of F + D = C, or $28 \, F + 11 \, C$ is to be marked to the figurum to the F = C - D, of F + D = C, or $28 \, F + 11 \, C$.

30 F + 11 D ≡ II copper or alloy.

The practical utility of the instrument will chiefly be—

1st. The determining the quantity of gold or silver
tuced in manufacturers' wares from either of these metals,
nand thereby caushing the employer to ascertain whether
the fluished article contains the exact amount of metal
furnished to the workmen.

2ndly. In ascertaining, if required, the value of a chain, though the gold used in the several links be of a different standard.

3rdly. In previously ascertaining the standard of a fasion, when various sorts of silver, of unequal size and weight, are to be melted together. 4tbly. In ascertaining the value of coins with the

greatest accuracy and despatch.

Fire Annihilators by Chemical Application.

PHILLIPS (Class V., No. 92, p. 222) has exhibited a fire maibilator. This is a portable machine for the immediate production of steam, and carbosin neid and other gases, which, being directed upon the hurning mater, is designed to check the progress of the finness more specifiy than the usual application of water. It is form cylindrical, and slightly coniect; it varies in size

from 16 by 8 inches to 24 by 12 inches, and is comparatively locapeusive.

For use, it is charged with a composition of powdered charcoal, nitrate of potass, and gypsum, in the following proportions: powdered charcoal, 20; nitrate of potass, 60; and gypsum, 5. These materials are boiled together in water, and afterwards dried in a store, at the temperature of 100°. The whole is moulded into the form of a brick, down the axis of which proctrates a bollow eavity, for the reception of a bottle, which contains a mixture of chlorate of potassa and sugar, sormounted by a globule of sulphuric acid. The charge so prepared in placed in a cylindrical vessel, perforated in many places, which is Itself within another cylindrical vessel, also perforated for the passage of the gases; both these are contained within a double cylindrical receiver, the lower part of which contains a quantity of water. apparatus is closed by two covers; in the outer of which is an opening for the escape of the vapour. In the centre of the cover is placed a spike, for the purpose of brenking the glass bottle deposited in the eavity of the charge. The spike being forced down breaks this bottle, and the sulphuric acid, falling on the mixture of chlorate of potassa and sugar, causes instantaneous combustion, and spreading over the charge, causes a second ignition at once to take place. The gases thus formed pass through the perforations, and by heating the air in the water chamber, and causing it to expand, forces the water up a tubular passage into the spaces between and around the eylindrical vessels placed each within each; and being thus converted into vapour, mixes with the gases, and escapes by the discharge tobe. The discharge forms a dense cloud, which continues until the charge is consumed and the water quite exhausted.

On Thursday, September 26, several gentlemen of the Jury assembled at Batternea Fields to witness Mr. Phillips' fire annihilator in operation. There were present—Sir John Herschel, Mr. Glaisher, Mr. Bowerbank, and Professor Collodon. A rough wooden house, two stories high, filled with planks of wood, shavings, &c., was set ou fire, and the doors and windows fast closed, previously to which, a quantity of spirits of turpentiae had been poured over the combustibles in the interior, from which in the course of a few minutes the fiames were seen issning from the windows, and on the door being burst speo presented an unbroken sheet of flame. The fire annihilator was then brought forward, and the vapour directed into the doorway. The effect was almost instantuneous. The great mass of flame was at once extinguished, and at the same moment dense volumes of smoke were seen issuing from the same place. In the course of a few minutes the fire was entirely extinguished, leaving the walls of the house standing, though considerably charred. Ten minutes after (a few lingering traces of fire to the windward being extinguished with wet mops), the Jury entered without inconvenience: the nir within being cool and moist. The experiment, which must be considered as a severe test to the powers of the machine, was considered satisfactory in the extreme. Shortly after, a tank, containing a mixture of tar, shavings, and other combustible matters, was ignited, and afterwards extinguished by one of these machines with equal success; the machine being placed to wind-ward, and the gas thus swept over the burning surface, in a state of most violent combustion, instantly aunihilating the flame.

The idea which Mr. Phillips has soccessfully applied to his fire annihilator was suggested to him by witness-ing, some years ago, in the Mediterranean Sea, an emption from an island, thrown up from a depth of 80 fathoms; he observed that, where the vapour formed by the boiling water, and precipitated upon the lava, en in contact with the flame, the latter was iostantaneously extinguished

The fire annihilator, in its action, may be said to resemble that of a pump drawing water, or the condenser of a steam-engine. The vapour which issues from it of a steam-engine. The vapour which issues from it outers the building in a highly-expunsive state, and extinguishes the flame chiefly by the presence of gases adverse to combustion, but partly also, uo doubt, by

reducing it to a temperature lower than that at which flame can exist. By degrees, the room being full of vapour, the temperature decreases, and the vapour condensing into water, fresh air enters to supply its place, and renders it possible for men to enter, and complete the work of extinction of the cohers. The machine is unattended with any practical difficulties in its use; the mixture of steam and gases may be produced within a few seconds after striking the top for the purpose of breaking the little bottle. The vapour itself possesses the advantage of being less destructive to the unconsumed articles with which it comes in contact, and being also a more penetrative medium than water, is better calculated to act simultaneously upon the innumerable particles of gas which combine to produce flame. It is stated to be perfectly innoxious to human life, which, of course, must be understood to mean during that short time, and in that state of admixture with air in which mee have occasion to inhale it.

When we take into consideration the large number of fires which, both hy day and pight, endanger the life and fires which, both ly day and night, endanger the life and destroy the property of individuals situated in or near the metropolis, the production of a machine such as that which Mr. Phillips has exhibited, promises to be of very considerable utility. By being provided with one of these, each househulder as possessed of an instantaneous means of checking a fire at its commencement, long before any great destruction of life or property could be apprehended. Its advantages on ship-board can scarcely be over-estimated, and are most obvious. The Jury, considering it well adapted in its application to the purpose intended, and being perfectly satisfied with its performance in this instance, have awarded Mr. Phillips a Prize Medal.

WEARE (No. 386, p. 451) has exhibited a fire annihilator, designed, hy means of a discharge of gas, to extinguish fire, and prevent the ignition and self-com-bustion of inflammable matter. As the Jury have had no opportunity of examining the machine, or becoming acquainted with its construction, they are not qualified to decide upon its merits,

Meteorological Instruments.

Considering the greatly increased attention which has been paid within the last few years to meteorological researches upon a systematic plan, a part of which is the using instruments well adapted to the work, it is both surprising and very lamentable to perceive, among the numerous exhibitors of barometers and thermometers, instruments of so ordinary and inefficient a construction, the greater part of them being ill adapted and totally unfit for meteorological observations. In the barometers exhibited, the majority of the makers, in their anxiety to render them elegant and decorative articles of furniture. have paid but little attention to its essentials as a philo-sophical instrument. Their forms, as exhibited, are various, it is true, not as might be expected with a view to discover that construction likely to give the soundest results, but more, it would appear, to suit the requiremeuts of those who can see in a barometer nothing more useful or important than a piece of household farniture, destined to take its place among the usual appurtenances of a well-furnished hall. This is much to be regretted, the barometer offering-as it does-so wide a field for the exertions of the instrument-maker to fit it for the increasing requirements of the present advancing state of meteorological observation. How disappointing it is to find all their exertium directed to the enshrouding it in a case which, with few exceptions, renders it not only cumbersome and inclegant, but, as typifying the apathy of a large class of instrument-makers to the fundamental principles of its construction, to us must offensive: oo the score of inelegance of construction, we may, however, except those exhibited by ELLIOTT and Sons. (Nu. 529). which are fairly models of claste design and excellent wood-carving. It would be well for the purchasers of these decorative and ill-constructed baroneters to remember that hy their adoption and use of such instruments they forfeit all claim to scientific notice, and they should also remember that to the well informed no instrument can be so pleasing in appearance as that which, from its construction, is well adapted to its work, and likely to lead to good and important results.

Of thermometers we cannot speak more favourably, the greater part of them being furnished with scales of ivory, a material most unsuited to a graduation of any kind; so much so, that the mercurial tube attached to an ivory scale cannot rightly be called a thermometer. The bulbs of those exhibited are nearly all too large, a defect which necessarily entsils a very slow change of temperature. In self-registering thermometers there is nothing new, and no attempt has been made to improve the work-ing of the instrument, either by the introduction into the maximum thermometer of a piece of enamel, as a substitute for the steel index, or by any other means. Very few of the tubes of the thermometers exhibited are sunk in the scale, so that the column of mercury may be in the same plane as the divisions, or the back part of the tube out away to attain the same object; and, what is still more to be regretted, very few thermometers in the superior to any for insuring delicacy of graduation and correct readings. These remarks do not apply to the foreign portion of the Exhibition; the exhibitors it includes, however, are few in number, but the instruments

generally are pretty good. No branch of physical science has suffered more than meteorology by the use of bed instruments. Many journals, after years of patient daily labour, have neces-sarily heen laid on one side as useless, owing to the imperfections of the instruments used, To judge from those exhibited, it would appear that as little attention is paid now to the construction of meteorological instruments in London, except by a few makers, as a few years ago, before the commencement of the systematic rescarches in meteorology at present being carried on by

very many gentlemen throughout the country. It is to be hoped that one of the good results of the Exhibition will be the calling into existence a better class of instruments generally, when not only shall be improved those accessary to physical research, but those also which are in general use by the public. That thermometer is the best whose bulb is small, whose divisious are cut on the stem itself, or engraved on well-seasoned box-wood or on metal. That barometer is the best which is made af brass throughout, and the ascreury of which has been boiled in its tube; there should be no plunger, no need of capacity correction; and the most means should be adopted for measuring accurately the distances between the surface of the mercury in the cisters and that in the tube, a measurement best attained by means of an ivory point, terminating a brass scale.

The best exhibitor of thermometers in the Exhibition is Fastrak (France, No. 511). All the instruments exhibited by him are distinguished by deliency, and are possessed of the essentials of first-rate instruments. The hest exhibitors of thermometers in the British portion of the Exhibition are NECRETTI and ZAHRRA (No. 160), whose instruments whose instruments seem to have been made with great care, the divisions being good, and mostly cut on the stems of the thermometers themselves. In appearance there is but little difference between those exhibited by Negretti and Zamhra and those by Fastre. The accuracy of division was not examined in either case.* We now proceed to speak in detail of the instruments

Self-registering Meteorological Apparotus.

exhibited.

Dollond (No. 145, p. 426, and see Illustration) has exhibited a self-registering meteorological instrument. which he has called an Atmospheric Recorder, This instrument registers simultaneously, for any period of time, according to the length of the paper use varying pressure of the atmosphere, the changes of tem-

* To examine a thermometer carefully, and determine its index errors at every part of the scale, is very trouble-some, and occupies a great many hours; yet every ther-mometer used for meteorological purposes should be thus

perature and evaporation, the variations in the electrical state of the atmosphere, the fall of rain, the amount of water evaporated from a surface of water, and the force and direction of the wind.

The apparatus is composed of a frame 2 feet by 3 feet 6 inches, and is firmly supported upon four pillars, the sides being strongly braced together. At the distance of to inches from either end of the frame, a roller 1 foot in circumference is placed. That near the south end is moved by clock-work, whilst the other acts as a reservoir for the paper; a third, of the same dimensions, is placed near the clock or driving roller, and so arranged as to press upon it equally throughout its length for the purpose of keeping the paper in contact with the driving-

A strong bar is placed near the north ond of the frame, upon which the fulcroms of several indicators, about a foot in length, are placed. Those far registering the variations of the barometer, thermometer, and bygrometer, have spring points at their ends; and those for the registration of the electrical changes, the fall of rain, evaporation, and the force and direction of the wind, luve cruporation, and the force and direction at the wind, have pointed pencils. The former are connected with a falling lever, and strike the paper once in every half hour, whilst the latter continuously mark the paper. Near the place of registration each element has its own scale. The in-dicators are continued somewhat beyond the fulcrams, and are thus connected with the various changes of the atmosphere to be recorded. Between each element on the atmosphere to be recorded. Jickwent each element on the paper a set of lines is drawn, which form zeros or base lines for the estimate of each. They also give a means of correcting any error caused by the hygrometric or other changes of the paper; on either side of the frame is a marker, which registers the time simultaneously at every half hour.

The barometer used is on the syphon principle, in the shorter leg of which is placed a float, so adjusted as to leave sufficient weight to follow the mercury. The regis-tered scale trebles the netual ebanges. The apparatus for the temperature consists of ten bent mercurial thermo meters, suspended upon a dolicate balance. The hygrometer consists of a sip of mahogany cut across the grain, which was divided as follows: being suspended from its upper end, in a cylinder filled with water, a weight of 2 lbs. was attached to its lower extremity, antij it was found, by repeated examination, to be completely saturated, and no longer to increase in length. Its whole length was then referred to an accurate scale. The slip rength was then referred to an accurate scale. The sing of mahogany was then placed beside the pipe of a stove, suspended and weighted as before, until its shortest length was obtained. The difference of the two results being earefully taken, the scale was formed accordingly. In its use it is suspended and weighted as before, in a tube placed outside the observatory, protected from the ann and rain, and has free power to not upon the indicator.

The electrometer is constructed as follows: a wellinsulated conductor is placed upon the highest convenient place, from which a wire is brought down to an insulator on the top of the observatory, and from thence to a standard, passing through another insulator to a usetal disc, between which and a spring a moveable disc is attached to n glass or insulating arm, in connection with the

tached to h game vergeistering pencil.

The electricity, in the first instance, is collected by means of points. There is n wire, connected with the means of points.

The rain-guage is placed on the top of the observatory, its receiving surface being I foot square. The rain is conducted by a pipe into a receiver inside the observatory. conducted by a pipe into a-receiver inside the observatory, and situated under the registering apparatus. An air-float is placed inside the receiver, and connected with a set of inclined planes, each of which is equal to a fall of rain I inch in depth. These inclined planes, as they pass upwards, being in connection with the indicating peucli, register the fall of rain.

The evaporating disb is an open cube of I foot square, covered with a plate of glass at such an angle as to pre vent rain fulling into it, yet allowing the air to act freely upon the surface of the water. The direction of the wind is shown by an Indicating postuli in connection with a sune. The force of the wind is shown by a surface of 1 fout square, being kept in opposition to the direction of the wind by a ware, whose proposition is the direction of the wind by a ware, whose proposition is the direction of the wind input the pressure plate, a nonoblasmon of mapended weights is ruised by a claim possing over a pulley in a line with the direction of the wind, and well proceeds from the westler. The wind, and well proceed from the westler. The keep and Indicating pencil. The scale has been determined by experiments. A Countil Medium was named to

Mr. Dollond.

1.1. pp. 423-420; sublite photographic Borona, fact he is deep registeration of the day and wet bells theremeters. * The principle is the same as that described in magnetical instruments, page 280.
† One large eistern will be found to not better.

which only moves by a slow motion acrew, subdivides the scale to 0.002 inch.

At the bottom of the instrument are three serews, turning in the fixed part of the support, and acting on the piece in which the lower pivot of the barometer frame turns for adjustment to verticality. The bore of the tube

is between 0° 50 to 6 of an inch' in diameter. Mr. Newman sherves that he has always found tabes boiled under atmospheric pressure to be foul, and that many betweeter made with larger token int holed look to rise to the top and depress the column. These difficulties were to be overcome before filling the tabe secondity, the bere of which measured from 0°5 to 0° 6 of an inch in diameter. Mr. Newman has adopted the next the defiding the tabe second that the column of the colu

Oscusan (No. 161, p. 429) has exhibited a standard barometer very similar in construction and workmanship to that of Newman; it loss, however, in addition a thermometer, placed in froat of it, with a hull of the same diameter as the tube, and there can be no doubt that the temperature of the two equal bulks of mercury will be the same. Vint (No. 324, p. 446) exhibits an ancroid barometer

of the usual construction. This beautiful instrument, so recently invented by M. Vidi, was rewarded by a Council Medal.

Nonzerty and Zasmas (No. 160a, p. 429) exhibits a bacometer arranged to register the lighest and lower readings. It is a plan isocounter, to the longer leg of readings. It is a plan is consister, to the longer leg of the property of the lower leg of the leg of the lower leg of the lower leg of the lower leg of the lower leg of the principal tube, and joining it at two inches from the top. The increasy flow freely in and cut of this mela, and the lower tube is placed a small piece of steet, which is kept in position by fine glass argings: as the mercury rises this piece of steet is pushed up, and remains suseriated index in the chorter leg.

Messes. Negretis and Zenden also exhibit is barometer with an air-trap plase sistem, to be read off by messas of a sliding scale, adjustable to the surface of the mercray by a fine ivery point. The tube and disters are lifered and the statement of the mercray and the statement of the statement of the statement of the statement of the statement is constructed entirely of plass. A folding harmeter is constructed entirely of plass. A folding harmeter is in the rentry, which, when folded up, earnies with it the

two valves of the tube with white it is connected. YEATOS (No. 332, p. 446) exhibits a barometer, furnished with a brass scale, terminating in an ivory point, and moveable is serew. The elstern is composed of plate-glass and iron.

Mr. Yeasie exhibits also a barometer, farnished with a registering apparant, while consists of a revolving cyline registering, and the construction of a revolving cyline is to thirty-one vertical portions, horizontally into tenths of inches, and unmoder for mail risches to 3 inches. To the revolver a possible a state to the surface of the unversely by means of a planger. Mr. Yeaste is not additionally by means of a planger. Mr. Yeaste host exhibits a third barometer, farnished with an ivery point, adjusted by a of the cistern. In those other horizonters a ready means in farnished of cleaning the surface of the mercury in the cistern care the surface of the mercury.

Sonalvico (No. 681a, p. 469°) exhibits a mountain barometer, two upright barometers, three ornamental wheel barometers, &c.

MALL (No. 6), pp. 415, 416) exhibits a meteorological clock, to which is attached a barometer and theratometer kept withrating by the clock connection, the number of vibrations in a certain time differing according to the variation of temperature in the one case, and of pressure of the air in the other; the number of vibrations is regin and thermometer are known.

TREMLETT (No. 163, p. 429) has exhibited a marine barometer in a arotal frame, with thermometer, enamelled

scales and spriogs to eleck escillation.

ELECT and Sons (No. 32), pp. 443, 444) exhibit baronacters curved in walnut-wood, the design representing the four seasons; circular carried wood baroneters similarly ornamented; Gothic carved barometers, and two

mr.y ornamented: Gottine carved barometers, and two mounted in ebony and gold. It is stated that the mercury in the tubes of all these instruments has been boiled. Bussilt (No. 673a, p. 468*) has exhibited a compen-

Bussill (No. 673a, p. 468*) has exhibited a compenatory cinere baronacter, in which, by a self-acting contrivance, the mercury is always preserved upon the same level within the cisters, unintidenced by alteration of temperature or any change in the column of mercury itself. Baows (No. 676a, p. 468*) exhibits be abrometer in ap-

pearance similar to a water-barometer; it contains two nonoiscible figuids of nearly qual specific gravities; and their point of meeting, which may be placed at any part of the scale, is indicated by one lipoid being coloured. The scale of the instrument, which is arbitrary, as 7½ feet tu an inch of mercury.

feet to an inch of mercury.

Mr. Brown also exhibits two barometers at an exceedingly low price. The readings of a similar barometer

ingly low price. The readings of a similar barouster, were taken for two montals commercing from July 15, simultaneously with those of a standard hormeter, and always found necessary to incline the instrument until the mercury filled the upper portion of the table : it afterwards decended to its proper level, though the rise at all times took place less freely on secount of the smallness than the contract of the smallness and the same proper than the same properties.

meters exhibited.

BENNETT (No. t, p. 406) exhibits barometers of an ordinary construction.

DIXEY (No. 271, p. 438) has exhibited a carved onk barometer, and an ordinary harometer. Baker (No. 616, p. 452) has exhibited two barometers.

BAKER (No. 616, p. 402) and exhibited two barometers, one of which is that invented by Mr. Brown, WATKERS and HILL (No. 629, p. 466*) have exhibited harometers of various ordinary kinds, and Professor

Potter's aerometric balance.

Girvs and KERN (No. 138, p. 422) have exhibited wheel barometers mounted according to various designate. Annaman (No. 140, p. 422) has exhibited a barometer, designed to show, without adjustment, the reading of the barometer, The scale is suspended over a pulley, by

means of a counterpoise, the lower end of the scale being connected to a float in the shorter leg of the syphon. A. H. Ross (No. 157, p. 429) has exhibited a self-compensating barometer. PIZZALA (No. 162, p. 429) has exhibited a wheel barometer, constructed with a rack-work motion. The case

meter, constructed with a rack-work motion. The case is elaborately carved in walant-wood. Grisold (No. 159, p. 429) has exhibited a pediment harometer, fitted up in a carved gilt frame.

amounter, actual para, actual para actual para several harmonters of an original resources on extension several harmonters of an original resources on. They consist of an elastic flattened tube of useful, exhausted completely of air, and bent very nearly in the form of a circle; they are in this state possessed of the property of expanding, a firster separation of the coed being effected when the atmospheric pressure is disminished, a construy or contenting offert taking place who the pressure is not contenting offert taking place who the pressure is made and the contention of the

which traveries a divided dail-plate.

The dislipshie is graduated by placing the instrument with a studied horocrete within the receiver of an associated horocrete within the receiver of an area of the place of t

Conneil Medal was awarded to M. Bourdon.

Galv Cazalat (France, No. 1230, pp. 1236, 1237) has

exhibited a manometer. The tension of steam is mea
piece of coamel inserted between the index and the new-

inced by the number of atmospheres to which in pressure in equivables, consequently, by the musther of incluse in equivables, consequently, by the musther of incluse in equivables, consequently, and the property of the pro

when the uncreary sinks below a certain reading, a ham
mer is made to strike a going. The helmana by this
uneans receives notice of the probable approach of rough
weather, and time is afforded for the necessary precasi-

weather, and time is afford tions of taking in sails, &c.

The tota is similar to that of the commo homomer, and is much chapter at the upper od; the lower extraulty terminates in a csp, which contains mercury, and in mich chapter at the contains mercury. And of the enhancement of the toke, a slight decrease in the residing of the homomer ensures a considerable dischape truck. This discappes a hanner, which, impelled by a paring arther a pong with considerable finere. The leaves are considerable for the contained and the contained of the contained and the contained and the leaves and may be so that sorder that like given of key required reading of the homomers. The leave is matched the purpose of adjustment.

Thermometers,

SIMMS (No. 741, p. 4759) exhibits two standard thermometers, constructed by the Rev. R. Sheephanks, who, during the last two or three years, has been more or lessagged in improving these instruments. The distintance engaged in improving these instruments, and termined by Mr. Sheephanks, will be used by Mr. Ghisher in all future observations, and he believes the two instruments, or both they may be the distintance of the distint

most correct in the country.

NEXESTER and ZANEMA (No. 1604, p. 429) eshibit a standard thermosteric, which evens to be good; everally a standard thermosteric public the standard thermosteric public by the standard thermosteric public by promotery to be Begnanik hygrometers, one furnished with black glass to equip, instead of shirty edispiend to standardian; some length of the standard the st

These are the only Exhibitors in the British portion who have seat thermometers with their stems graduated, the only safe instruments for delicate experiments. A Prize Medal was awarded for the beautiful work

shown by these artists.

NEWMAN (No. GAP, 9-68%) exhibits a standard thermometer, the bore of which is attated to be a perfect equinder, having been examined by the late Capstain Kater and Professor Daniel, as well as by Coloned Schiner. In seals is dividued into half degrees; that part of the same plane as the excellent of the professor in the professor in the same plane as the excellent power is very costly, in the same plane as the excellent power in homes the errore of rending, so far as parallax is concerned, is avoided. Also, a maximum register theremometer, with a small

cury; a minimum and maximum register thermometer, with black bulbs; a Daviell's bygrouseter; dry and wet bulb thermometers; a Lind's wind-gauge; and raiugauges of different kinds.

gauges of unferror sames.

Pilling (No. 411, p. 451) exhibits a maximum thermometer, with a bubble of air, which, by separating a portion of the mereury, causes it to act as the index; an air barometer for ceal-pits; and a new electrophorus and cuver, to work without making counted by the hand.

WATMINS and Illil. (No. 659, p. 466*) exhibit a dry and wet bubb thermometer, and other thermometers of an

and wet bulb thermometer, ordinary kind.

Harms and Sox (No. 149, pp. 428, 429) have exhibited a self-registering thermometer.

Fillow r and Soxs (No. 320, pp. 443, 444) exhibit various ornameuted thermometers, and some intended for the pocket.

Bennert (No. 1, p. 406) has exhibited many thermometers; they are for the most part furnished with lvory scales; the bulbs of those furnished with box-wood scales are too large.

Dixey (No. 271, p. 438) has exhibited several selfregistering thermometers.

Baker (No. 396, p. 452) has exhibited a thermometer

for agricultural purposes.

FATTA (France, No. 301) exhibits probably the best series of delicate and necurate thermometers in the Exhibition; they are distinguished by being nearly all engraved on thin glass stems, and include exceedingly delicate dry and wet both thermometers, forganul's bygrometer, &c. M. Fattré deserves high praise for the production of these beaufful instruments, which the Jury

consider worthy of a Prize Nedal.

LUBNE (Prassia, No. 83, p. 1053). Good thermometers; divisions on glass, and some on paper.

JEAGER (Austra, No. 134, p. 1014) has exhibited
thermometerin graduated on glass, for immersion in acids.

JERKE (AUSTIS, AO. 154, p. 1014) has examined thermoneter graduated on glass, for immersion in acids. Jenuessessa and Sons (Denmark, No. 17, p. 1550) with two metallic thermoneters, of a circular form, so arranged as to show the temperature at the time of observation, as well as the maximum and minimum temperature since the previous inspection. A Prize Medal was swarded to Messra, Jurgenenes and Sons.

Anemometers

PHILIPS (No. 441, p. 454) exhibits an anemometer, designed for coal-pits and hospitals, consisting of a semicircle of card-board, graduated on its edge, and mounted on an axis passing through the diameter of the circle of which the card is the half.

Dr. HENNARU (Belgium, No. 183, p. 1157) exhibits a small travelling anemoneter, extremely well made, of a simple construction, and furnished with a series of fans, which, by a simple and effective contrivance, may be stopped or set in action almost momentarily. It is intended chiefly to determine the horizontal velocity of the uir in a given time. To this exhibitor Honoarable Mention was awarded.

Rain-Ganges, Physics (No. 411, p. 454) exhibits a rain-gange, open

at the top and four sides, prepared to show not only the fall of rain received on a hormontal surface, but also, by a simple calculation, to ascertain the inclination of the path of the drops and the direction of the rain. The Jury have swarded Hosomarbie Mestitou to Mr. Philips, Watains and Hill (No. 659, p. 466) exhibit Crossley's self-registering rain-granger.

self-registering rain-gauge.

Bases (No. 396, pp. 451, 452) has exhibited a rain-

Pyrometers.

Encasor (United States, No. 146, p. 1443) has exhibited a pyrometer, an instrument for measuring temperatures from the freezing point of router to the melting point of iron, as indicated by the tension of a pernament volume of air or azote, which is measured by the resiling of a column of mercury under a vacuum. The instrument is designed to meet the requirements of the artizon in all works which involve the application of great heat, and

are dependent for success upon an evenly regulated temperature. In the formation of the scale, 32 and 212's have been respectively taken for the points of freezing and boiling water.

The instrument is composed of the following parts:—
A chamber containing mercury, with a flexible bottom, composed of a steel spring, or India-rubber held between steel plates, which may be raised or lowered by means of a serew. Into this chamber a glass tube filled with mercary in planged to within one-attacent of an inch of the

lower. The waveraid citiers a short glast side is intered, because of which has been of which it is early filled by a silver wire, and a base of which it neutry filled by a silver wire, and a worker-deed. A configuration and the silver is the base of which is the silver in the second of the silver in the second of the silver is the silver is the silver is the silver in the silver is the silv

of the medium in the platina hulb.

The graduation of the smaller of these scales reaches only to 700°, but that of the larger is extended to include the melting point of iron. A spirit level for placing the instrument in a vertical position completes the adjust-

It is to be remembered, that the graduation of the scale is independent of any imperfection in the bore of that tube, and is not affected by the expansion of the bore from heat, the volume for measuring which being permanent and not expanding, affords greater accuracy in the readings at high temperatures.

The pyrometer comes into action where the thermometer ceases to be effective, the air or anote in the bulb of the former canhling it to remain unchanged nater extreme variations of semperature, whilst the latter explodes on being thrust into an ordinary flux or vessel of over-hearted lend.

WERM (Austria, No. 137, p. 1014) has exhibited a pyrometer. The instrument is composed of a strong and pyrometer. The instrument is composed of a strong and stretched a moderately strong gains as stretched a moderately strong gains. Stretched a moderately strong gains as with an index in the handle, so arranged that the view (teling always kept in a state of tension by a spring or otherwise), when relaxed by expansion, shifts and marks the amount of extension.

The whole frame being introduced into a furance or oven, the wire acquires instantly the temperature; the massive frame much more slowly. Relative expansion of the wire therefore takes place, and when this has attained its maximum the index is read off.

The instrument exhibited is adapted to ovens, &c., and is of considerable dimensions.

Tide-Games,

Hervitson (No. 12a, p. 489), eshibits a self-esting and effecting and effecting arting the long, every part of which dusplay, see extracting the long of the control of the long of the lo

The instrument is also furnished with a system of wheels, by means of which the depth of water is shown an a circular dial; that placed at the mouth of the Tyne is illuminated at night, and can be seen at a great distance

The instrument is elegant in appearance, and seems to be perfect in its action, and is the only one which shows

time and tide by separate dials. A Prize Medal was awarded to Mr. Hewitson. Nzwana (No. 674, p. 468*) has exhibited a self-regis-tering tide-gauge. This instrument consists of a metal of Bode 70 feebast in mourth and it. cylinder 30 inches in length and 8 inches in diameter, cymoser 39 license in length and 8 inches in diameter, moved by a clock, and performing one revolution in 24 hours. A pencil moved by a float is suspended by an estiless chain, and maintains always the same howancy. The pencil attached to the chain is carried over two sylinders, one of which contains a spiral sping, and is so contrived, that the marking of the change of title is im-mediate. On the face of the clock is shown the height of measure. On the face of the clock is shown the height of the tide at the time of observation. It also registers the highest and lowest for the day. The papers require replacing every furtnight, and the pencils used are

reparency exect money. The control is a given number of links, the ends not soldered tegether, which in its progress downich are not soldered tegether, which is not progress loops over the spikes in the burrel; this method will do not line; but as the links cannot keep all of the same kength, it is probable that some will not catch, but the control is not catch.

Acoustics.

HERRS (No. 615, p. 476) exhibits a pulpit, to the reading-desk of which is attached a receptacle for collecting sound, to which a gutta-perein tuning is connected, in-tended to be carried under the floor, or otherwise, to the pew of the deaf person; the terminal of the tube, which is intended to be applied to the ear, is of ivory,

REIN (No. 629, p. 477) has exhibited several instruments for acoustic purposes; one of these may be worn without being seen, is adapted to the shape of the ear, and requires no spring. The power is great in proportion to its small size, the entire length of tube being 8 inches, Another acoustic contrivance, which may be worn as a

lady's head-dress, without being seen.
Also a new promoter of hearing. The great fault in
instruments of this class has hitherto been the concentra-

tion of the sound in one ear only; so that, whilst the sound was much increased in loudness, it remained, if possible, still more confused and indistinct. To obvinte this inconvenience, Mr. Rein designed this contrivance. which is to be worn on the head, and is adapted to both cars: by means of it the faulty car is called into equal action with the healthy one. When worn by ladies, it

nay be quite concealed by the hair,

An acoustic chair. This is so constructed that its
power hy reflection is doubled to either ear, and may be used at pleasure for one or both cars. In the latter case the power is fourfold. The chair is rendered acoustic by the arms being made hollow, and terminated by a design suitable to the free admission of sound, which is conducted to the ears of its occupant, by two small tabes, projecting from the issuer side of the back of the chair.

An acoustic wase, designed by its construction to collect the sound from all parts of the room. The vase being

placed on a small table, the attachment of the tube is skilfully concealed beneath the table through which it is Inserted; contrary to other contrivances for the same purpose, it is not trumpet-shaped, and in its appearance does not resemble an acoustic instrument.

All acoustic instruments hitherto made, partake more or less of the trumpet form; and all agree in one respect, viz., that the mouth or orifice for the reception of sound, is bounded by a line, generally circular, every point of which is in one plane; and, therefore, it is necessary that the voice of the speaker should be directed as nearly as ossible at right angles to this plane. Some instruments ave been made consisting of a large metallic receptacle for the sound, with a long flexible tube attached to them; for the sound, with a long flexible tube attached to them; hut they are very unsightly objects. The vase above de-scribed differs from these in the following particulars:— lst. That the orifice for the collection of sounds is arranged on a circular plan, so that when the instrument is placed un n tuble in the centre of a room, the deaf person can hear speakers in any direction with distinctness proportionate to his degree of deafness, or the tone of voice used by the speaker.

2nd. That it has not the appearance of being an acoustic instrument. 3rd. That it may be used as a flower vase. It is of

course furnished with a flexible tube for the purpose of conveying the sound from the vase to the ear.

Mr. Rein has exhibited more than one design of the

acoustic vase, several acoustic bells, also an acoustic walking-stick, which may be applied to either car, without being recognized as an acoustic instrument, Several portable telescopes, adapted to various degrees

of deafness An acoustic instrument, or "Social Companion," to

comble any number of persons to converse with one who is deaf, and requiring no change of place.

A conical and flexible whispering tabe, so constructed

that extremely deaf persons can distinctly hear and hold conversation even when spoken to in a low tone of voice A whispering tube, and car-caps or reflectors, which lust may be worn without a spring.

WATKINS and Illed (No. 659, p. 466*) exhibit a

syrene; an instrument used in acoustics for demonstrating the production of a musical sound by a succession of musical impulses. The invention of M. Cagniart De La

Planimeters.

Sang (No. 333, p. 448) has exhibited a planimeter. The peculiarity of the construction consists in the product of the ordinating lines being given by the motion of a disc over the surface of a cone, justead of over a plane, hy which means, the motions representing both the ordinates may be taken directly from the motion of the tracing point. In the Tuscan instrument the motion which represents one of the ordinates is conveyed through a ruck and pinion, and in those of Swiss and German construction, through a hand and pulley. The arrangement of Mr. Sang is designed to obviate the shake necessarily canned by the teeth of the rack, and by the clasticity of the band of the pulley.

The parallelism of the instrument is trusted entirely to the simple rolling of two heavy wheels over the paper, This is rendered more certain in the foreign instruments by the rollers working in guides as on a milway. All, llowever, appear free from any tendency to divergence in

Mr. Sang's instrument possesses a practical advantage in the readiness with which it may be placed at once on a drawing of any size.

The error contained in the results given by instruments of this class generally arises from the shaking or elasticity of the parts which connect the index with the tracer. This error in practice may be easily corrected by mensuring the figure twice; at one time placing it so that the suring the figure vince; at one time passing it so that the shortest hreadth is represented by one of the motions, and at another, so that the longest hreadth is represented by the same motion. The average of the two results will be very nearly the trath. The Jury considered Mr. Saug as well deserving Honourahle Mention.

Gonella (Tuscany, No. 70, p. 1298) has exhibited a planimeter. All, or very nearly all, the planimeters, of which the Exhibition contains several, turn upon the mechanical integration of the differential expression for the area of a curve traced on a plane surface, and are most readily conceived on that old and now almost forgotten view of the differential calculus, which regarded the difyew or, toe differential calculus, which regarded the dif-ferential of a magnitude as a measure of the vehecity of its increase at any instant. Suppose a straight line to be carried with a uniform motion along the bose line (or nahesissa as it is termed), of any carrillment area, remain-ing always paraille to itself and perpendicular to the base line; and that, during this motion, a moveable point in the line so carried is kept always on the circumilerence or boundary line of the area. Then it is clear that the relocity of increase of the area will be proportional to and therefore measured by the length of the ordinate, or point of the movemble line included between the base line and describing point.

Suppose, again, that a circular disc or wheel can be made to records with an angular selective, a laway proportionate to the same ordinate. There will the total angle more than the same ordinate of the same selection of the necessary with the currilinear area, and consequently be always proportionate to and a measure of that area. The area, therefore, may be in effect or off giapon in circumnumber of revolutions and parts of a revolution made by the way of the same parts of a revolution made by this waked, which may be called the integrating wheel, due,

If a circular disc be made to roll (whether by rackwork of prefection) upon a tine parallel to that on which its work of prefection upon a tine parallel to that on which its nufferm. Supposing then a racket bar, parallel to bacissan, and unrapable of motion in the direction of its length, to work into a toothed wheel out the axis of steps is uniform. To convert this uniform angular motion into whose this motion of its center parallel to the allocation. To convert this uniform angular motion is into problem of planningers not operative, is, therefore, the problem of planningers not operative.

If the eireumference of two circles, whether in the some or in different planes, be so connected, either by teeth, as in ordinary wheel-work, or by mutual friction and adhesion, their augular velocities are inversely as their radii; so that if the radius of one of them be constact, its angular velocity will be directly as the radius of the other. Any disposition of the parts of a mechanism then, which shall seenre the condition, that a roller or rolling disc shall be carried round on its centre by contact with a uniformly revolving eircle of a radius, always equal to the length of the variable ordinate, contains the solution of the problem. The uniformly revolving disc may be horizontal (that is parallel to the surface of the area to be measured), and the integrating roller at right angles to its plone, having its axis horizontal and parallel to the ordinate as directed to the centre of the disc. the construction adopted by Gooella and Gaspar Wettli, or it may be perpendientar to the horizon, being no other than the transverse section of a cone whose vertex lies in the abscissa of the curve, and the radius of which section is therefore proportional to the distance from the vertex, or to the ordinate. This is the construction adopted by Sang (No. 338); but it is only justice to Mr. Gonelia to state that this construction is expressly indicated and figured in his original Memoir on the Plans-incter, which carries the date 11th June, 1827, in which there will be found a full account of Mr. Gouella's instrument, and a very elaborate (though unnecessarily complieated) exposition of its theory, and to which we therefore refer for the particulars *

A very great awing in the expenses of econopatation in the reduction of local surveys, to give the areas of diatriets, parishes, estates, and fields, as laid down in maps, has been found to result from the me of these instraments, where indications are smillicient for all practical uses; † A Council Medal was awarded to Mr. Goegel.

Let of Testace, No. 367), has exhibited a phasimeters in which the area of palma, supposed to counts of triangle, is first reduced, by geographical counterfeitings, to any right-stagder transport. On a rectungly of either perhation produced to the produced of the continue to an obsesse contained for such, shall change from hyperfeits to hypelosh by a constant increment. The extremity of one side contained for such all the hyperfeits of the produced common center of all the hyperfeits, and that side with the asymptote, the opposite angle with of necessity fall to one or between two adjected ones of the hyperfeits, and

 † Tracing with a pen dipped in dilate sulphurie acid.
 proper of a professor and priferen historiess by the aid of proper of a professor.

† Tracing with a pen diqued in dilate sulphuric acid on paper of a moderate and uniform thickness by the aid of transmitted light, and weighing the portion cut out by the currenties acid on of the acid on exposure to heat, will enable any one to extemporize a planimeter, following the most intricate details of outline, not giving the total area with a very considerable approximation...J. F. W. its area (or its double) will be therefore expressed by the ordinal number of the hyperbola, or the nounber of the lowest plan or proportional part for the distance between that and the angle, as compared with the interval between the two consecutive ourse.

This instrument, termed an "olarithme," is intended for the use of persons regarded to geodetical operations, and it offers a simple and ready means of necessing the surface of any portion of a plane. The Jury awarded Honourable Mentios.

Warria (Switzerland, No. 84, p. 1072,) exhibits a (Goldschmidt's) plantimeter, for necessiring the area of any plane figure, by the simple operation of drawing a tracing point round its periphery, the area being indicated by the divisions of a cirple, wheh is fixed.

plane figure, by the simple operation of drawing a triering point round its periphery, the area being indicated by the divisions of a circle, which is fixed.

The disc is of glass, covered with paper, and receives the movement of rotation by suitable and simple mechanism. The results obtained by this instrument have been found to be correct within 1-1000th part of the area. The Jury awarded a Prize Weldal.

AUSTRED (Hollin, Prinsia, No. 704, p. 1089) exhibits a planimeter, consisting chiefly of a soull rofler, moving npon a horizontal disc. The instrument is well conceived, and tolerably well carried out. The Jury awarded Houourable Mention.

Dynamometers,

Taxasses (Proce, No. 106, p. 119%) has exhibited a dynamouric, adopted for the measurement of very great symmetry, adopted for the measurement of very great such as the princip to be best, set is teightway, or realest in the direction of the currous tangens of a stream or a first dark of the currous tangen of a stream or being proceed to by the driving power, the other inserval and grid angles into a strong realist are measuring from the circle, and by compression are readered more course, the circle and by compression are readered more course, the circle and by compression are readered more course, the circle and the compression of the circle and before properties and through the medium of a third about the state of the circle and through the medium of a third about the state. A cylinder of farms serves as on index, and robot off a section of the circle and hard which the gandanties in so executed as to indicate the power accessive plotter in the additionance this pratice, and the course of the course of the course only for heavy supplies work. A Council Medial to availed to M. Tartiere,

M. Clair has also exhibited the model of a feedmotive fire-engine; a vertical section is also exhibited upon a large scale.

Dr. Hyron (Austria, No. 130, p. 1014) has exhibited a dynamograph. This is an instrument not unlike Regnier's, with the addition of a piece of elock-work, regalated by a flow, which can be set in motion or stopped at
pleasure; it earries a peneil along the index of the instrument, recording at any moment the position of the index
on a piece of paper stretched beneath it. Honourable
Mention is awarded to this exhibitor.

CAZAUX (Netherlands, No. 89, p. 1147) exhibits a dynoncostater, intended for use as a dynamometer for ploughs, but applicable to the measurement of other strains, and to fail.

furnished with a chronometric controller. It consists of two levers fixed to an iron frame, which mutually act on each other by a joint; to one of these the plough is attached, and to the other a counterpoise which constitutes one of the factors for the measurement of power, as it changes its position with a change of strain, which

changes are marked as the lever moves. The chronometric controller consists of two watches provided with seconds-hands, one of which is unaffected by the pull, and merely indicates ordinary time, whilst the other is acted noon by the varying position of the lever, in such a manner that its rate per minute varies with the varying strain, and is self-registered. By this means all varying resistance is recorded, such as is experienced in the towing of a ship, &c., cases in which the ordinar dynamometer acted upon by means of a spring, is found

Crystallography.

Lezzon (Class I., No. 8, pp. 120, 121,) exhibits a very beautiful collection of crystals; the apparatus for illus-trating the crystallographic speculations poblished by Dr. Leeson, in the third volume of the Memoirs of the Chemical Society; a double-refracting goniometer; and numerous models of crystals. A Prize Medal was awarded to Mr. Lecson

It is difficult to understand why the remark "rect gular" is annexed to a model labelled antimony. guar is annexed to a model latelled antimony. For according to the independent observations of Marx, G. Rose, M. Zippe, and Haidinger, antimony crystallizes from fusion in a form, the faces of which make, with each other, angles differing nearly two and a half degrees from a right angle.

MITCHELL (Class I., No. 9, p. 121) exhibits a collection of crystals: some very beantiful card-board models of crystals, in which the faces of each have a distinctive colour, as in some of the plates of Tennant's Mineralogy, and are marked with symbols according to the notation

adopted by different crystallographers.

Also some very incensorsly contrived skeleton models. showing the ontline of all the simple forms of a crystalline species, referred to the same axis.

Other models, some to illustrate theoretical views, are exhibited by Mr. Mitchell, according to which, the simple cannoted by Mr. Mitched, according to which, the simple forms of crystals of any system may be derived from those of a crystal of the cubic or octahedral system. A Prize Medal was awarded to Mr. Mitchell.

LUBRE (Pressis, No. 83, p. 1053) exhibits an extremely ood collection of models of crystals, selected by i. Rose

G. Rose.
Schröding (Grand Duchy of Hesse, No. 77, p. 1129.)
schibits models of crystals, described in Kopp's "Einleitung in die Krystallographie," on a large scale, which are probably the best-executed models that have yet been under he also exhibits various models of geometric solids, which appear to be as well executed as the crystals. A Prize Medal was awarded by the Jury to Professor Schrider.

BATKA (Austria, No. 135, p. 1014) exhibits some very good models of crystals in glass. BERTAUD (France, No. 1549, p. 1251,) exhibits models

Drawing Instruments.

Variet and Son (No. 257, p. 436) have exhibited a graphic telescope and table; also a small graphic stand,

The telescope is furnished with a variety of powers, and affords every variation of size in the object to be traced, which may be sketched to the true perspective

distance of the picture on which it is to be placed.

The field of view is large, but the picture may be extended by moving the telescope, and shifting the paper, there being a means of applying correction, if necessary. The paper or drawing surface may be placed in any convenient direction, and inclined at any angle, the instrument affording facilities for delineating objects in all sitions, whether overhead, on the floor, or right and left The image can be adjusted with equal precision at what distance sever the eye may be removed from the paper, and may also be reversed, for lithographic purposes.

This instrument has assisted in the production of the great " Panorama of London, as seen from the top of St. Paul's," at the Colosseum, in the Regent's Park, and in that of Corfu, the coloured sketches for which, on a large scale, were made by the late Joseph Cartwright, Esq.

The graphic telescope is designed to afford assis ance to artists, architects, and draftsmen, by presenting to the eye a correct image of the object to be traced, in any

direction and of any size required.

In order to trace telescopic images, great steadiness and portability are required. Both these requisites appear to be combined in the graphic table exhibited by Mr. Varley, The framework is so constructed as to be extremely light and steady; the joinings are made with hinges, from which the pins may be removed, and the instrument packed into a small compass. The table itself is supported upon a braced tripod, and admits of adjustment uton any surface, however irregular; it can also be supted at any angle.

ELLOTT and Sors (No. 320, pp. 443, 444) exhibit a fine magazine case of drawing instruments, inclusive of all the recent improvements; the two trays with which it is furnished, and the interior of the lid contain metal rulers, sectors, triangles, ivory sectors, parallel rules, pocket rules, a graduated joint for taking angles, &c. The metal sectors are well divided, as are also those made of ivory. In the drawers is a complete set of which is in colours. This set of instruments, the case of which is in colours. colours. This set of instruments, the case of which is in itself a fine piece of workmanship, was rewarded with a Prize Medal.

The same exhibitors have another case of instruments, of good workmanship, and highly ornamented by engrav-ing and chasing. They exhibit also various sets of ivory ing and chasing. They exhibit also various sets of ivory sectors, divided from 10 to 100 to the inch, and ivory parallel sectors, capable of being used on both sides, with divided edges both sides. They also exhibit a small in-strument called an opisometer, intended for measuring the length of curve lines. It consists of a small roller, which, having been passed over the lines, is made to perform the same number of revolutions over a scale.

PILLISCHER (No. 269, p. 437) has exhibited an ellipto-graph. The principle upon which this elegant little instrument is made to describe an ellipse, is that of a point instrument is made to describe an empse, it canson a point revolving in a circle about a centre, with an angular velo-city the double of that with which the centre revolves about a fixed centre. The cogs on a movemble bar, and wheels of the instrument are so arranged that the short arm which holds the style performs 100 revolutions while the long arm performs one. By varying the relative drawn. The semi-major axis of the ellipse will be mani festly count to the sum of the two radii or arms, and the minor axis equal to their difference. A Prize Medal was awarded to Mr. Pillischer

Sixus (No, 741, p. 475*) exhibits an isometrical ellipto-graph. Invented by G. B. Airy, Esq., the Astronomer Donson (No. 323, p. 446) has exhibited many well-made

sets of drawing instruments, so far as could be seen through the glass case, which was never opened for the examination of the Jary. TREE and Co. (No. 324, p. 446) have exhibited some

well-made drawing instruments, with many accurately divided scales for different purposes. The Jury swarded Houourable Mention PABBE and SONS (No. 337, p. 448) have exhibited well-made drawing instruments, and several well-divided scales. DIXEY (No. 271, p. 438) has exhibited several mathe-

natical instruments, amongst which is a divided ivory rolling parallel rule. HAGGARN (No. 328, p. 446) exhibits a double pro-

tractor, intended for measuring angles, and determining heights and distances. Gaanax (No. 355, p. 449) exhibits an ivory rule, one foot in length, and an inch and a half in breadth, for the purpose of exhibiting by inspection the circumference of a circle when the diameter is given, and vice versa, and for

showing the side of the square equal in area to that of a circle, whose diameter or circumference is given.

One side of the rule contains three lines extending its

whole length, the upper side of each being divided into 100 parts. The under side of one is divided into 315 parts, 314 of which are equal, the remaining part being equal to 0:16, and the relation existing between the divisions above and below, the lines being that of the diameter to the circumference of the circle.

The under side of the second line is divided into 89 parts, 88 of which are equal, the remaining one equal to v623. On the diameter of a circle being given, on the upper side, the side of the square whose area is equal to that of the eircle of that diameter, is read at the same point on the noder side.

The under side of the third line is divided into 283 parts, of which 282 are equal, and the other is equal to 1005. The relation existing between these lines at the same point, is that of the creumference of a circle on the upper side, to the side of the square (to one place of decimals) equal in area to the area of the circle. The reverse side of the scale is occupied by seales of

equal parts.

It is noderstood that Mr. Graham has arranged other lines, shawing the relation existing between the area of the circle when the diameter is given; and another giving

the area when the circumference is given.

Marrians (No. 1986, p. 4.4) exhibits an antrament for Marrians (No. 1986, p. 4.4) exhibits an antrament for a superior of the property of the

Honse, Thonsersusarri, and Woop (No. 230, pp. 434, 435) exhibit Tebay's universal planing-rule, the northconsisting in the arrangement of the division of the odd and even scales; by continuing the graduation to the edges, the necessity of making use of dividing compasses is obviated.

GATABLE TRANSC. No. 205. p. 1197) rabible imported protestips the importments, which costs principally in a better arrangement of the studying weight of the protesting that the protesting of the studying weight of the amount of the contract of the studying weight of the protesting of the studying that the protesting that the protesting that the protesting that the studying the studying that the studying the studying that the studying the studying that the studying the studying that the studying that the studying that the studying that the studying the studying that the studying that the studying that the studying that the studying the studying that the studying the studying that the studying the studying the studying that the studying the studying that the studying the studying the studying the studying the studying that the studying the study

workmanhip, and an instrument for driving from matter by mechanical means. A telescope with a cross wire in its focus is suspended in a junhal frame, near the eve, and so as to keep the position of the eye nearly fixed. It is so balanced and so lightly hung as to allow the most perfect freedom of mution, and the cross of the wires being carried along every part of the outline of the object.

The object and of the tokenope is suspended over a pulsey on severidal appeart, by an lift supiley on survival appeart, by a result for which is conpulsed to a reverside appearance of the pulse of the pulse of the normal hars to a possible-boller ridding out the law. Thus any movement law few reversid direction is reserved on appear, appearance of the pulse of the pulse of the pulse of the appearance of the pulse of the pulse of the pulse of the amounthment. As specimens of its performance are easily of most deliction excessed, and of the wide pulse of the complexity; and served or confirms, in literatures of the interior of the Palace of Versaille, with its rich and facility and delictory. Such are executed with equilibrium.

By adapting a microscope instead of a telescope to the jimhal frame, the outlines of a microscopic object, as of an insect, wood section, &c., can, in like manner, be traced with perfect fidelity, and on any scale. Hononable Mention was awarded to M. Gavard.

LUTTIG (Prussia, No. 81, p. 1053) exhibits several cases of well-made drawing instruments, some in German silver and some in brass. The Jury awarded Honourable

Mention to M., Littig.

REFIRES (Boxaria, No. 34, p. 1100) exhibits a case of drawing instruments; and Honourable Mention was nwarded by the Jury for his new method of fixing the two parts of a compass together by means of plane surfaces with steadying pins and srews.

Homera-Esser (Switzerland, No. 81, p. 1272) has exhibited drawing instruments, distinguished for the care with which the most minute details have been fluished. A Prize Medal was awarded to this exhibitor.

A Prize Medal was awarded to this exhibitor, Grss (Switzerland, No. 83, p. 1273) has exhibited drawing instruments. The remarks applicable to the preceding exhibitor, apply equally to these, and it may be observed, that the steel used by both exhibitors is of the finest quality and extremely well tempered. A Prize Medal was awarded to this exhibitor.

Medal was awarded to this exhibitor.

Kerm I Switterland, Nos. 88 and 92, p. 1272) exhibits
some well-made drawing instruments, which, in common
with those of the Swiss exhibitors, are made in different
parts, which can be readily separated and cleaned with

The Common Commo

with those of the Swiss exhibitors, are insule in unferest parts, which can be resultly separated and cleuned with ease. The Jary considered Mr. Kern as deserring Husourable Mention. Results of the Swiss (Russis, No. 169, p. 1372) exhibit a full set of twonty-served drawing instruments, comprising elven different articles is inches in length; a set comprising ten pieces of 3 inches in length; a set comprising ten pieces of 3 inches in length, and monnted in silver.

monneed in silver.

The following drawing instruments are exhibited monnted in brass: a full set of twenty-four pieces; a set of eleven pieces 5 inches in length; and a set of ten pieces 3 inches in length.

The following pocket instruments are eshibited:— Polking or silver-mounted compasses; brase compasses in silver shouth! compasses; brase compasses in silver shouth! und several atther compasses mounted in short, come framished with pencil tubes, and mostly folding up. All these instruments are well made, and include the recent improvements; they deserve very illonourable Mention.

Virking (Sweden, No. 14, p. 1550) exhibits two small

cases of drawing instruments, containing each a protracting semi-circle, a pair of large steel pointed compasses, two smaller for steel peas on exchangeable penell points, and a sited railing peo. They are very nearly made.

LATTAM (Nurway, No. 15, p. 1350) is stated in the contract of
NIETZCHEANN and VACCANI (Prussis, No. 706, p. 1089) exhibit many sets of drawing instruments, of an exceedingly low price. The Jary awards Hononruhle Mention for cheapness.

ROCHETTI (Anstria, No. 136, p. 1014) enhibits a case of drawing instruments of sinteen pieces, compasses, &c.,

of brass and steel, of very elegant construction. There is no prometer, ruler, or scale.

Prancom: (No. 318, p. 443) has exhibited registered screw and stiffing helecomynib for draw sing volutes, serold work, and spirits of varions kinds. The outline may be the discoming the standard proper, either with into or possell by the shiding beliecograph. For a description of these delivers and well-constructed instruments see the Illustrated

Catalogue.

A Prize Medal was awarded to Mr. Penrose.

Orreita, Plausturiuma, and Autrosonical Mechius. It is a matter of regret that the time and ingenuity which have been devoted to the soweral machines of that class in the Exhibition, have not been better directed. Those exhibited do not indicate any improvement over the many which have been converged in the control of
nd. The time, ingenuity, and expense, devoted to machines of astronomy, and the erroneous impressions which they give are always displeasing to the cyn of the astronomer. If they be of any use in the lecture-room to children and novices, certainly Facy's vertical orrery is the best adapted for this purpose.

Orreries

Fact (No. 195, p. 431) has exhibited a vertical orrery, showing the relative periodic times of the planets. A cornet's orbit is also introduced which extends from within that of Mercury to some distance beyond Neptune. The Jury voted a Prize Medal to Mr. Facy for the ingenuity displayed by him in the construction of this orrery. Newron and Son (No. 212, p. 434). An orrery, show-ing the motions of the earth and moon, the planets and their satellites. The mechanism by which these several morements are perfurmed is actuated by clock-work. They exhibit a smaller orrery, constructed on the same

principle, but showing only the motion of the earth and BIOOR.

PLANT (No. 215, p. 434) has exhibited an orrery, the san being represented by a luminous body; the seasons, phases of the moon, and other natural occurrences are clearly shown. It may be used to the greatest advantage in a darkened room, when the sun of the orrery will best show the various changes attendant upon the different

motions of the several bodies.

Planetariums.

Nawton and Son (No. 212, p. 434). A planetarium for educational purposes, intended to show the diurnal and annual motion of the earth and moon, also the respective annua motion of their satellites. It is exhibited for cheapness.

Le Frover (Jeney and Guerney, No. 10, p. 941) has
exhibited an orrery; it is designed to show the motion of
the moon around the earth, her daily variation and position at the time of new and full moon, also to exhibit the cause of eclipses, either partial or total. It is intended for the use of schools.

MASSETT (Switzerland, No. 95, pp. 1272, 1273) exhibits a planetarinm of an extremely sample construction, in which the motions of the sun, the earth, and the moon are shown. It is remarkable for its cheapness, and Ho-

nourable Montion was voted by the Jury.

Mollison (No. 585, p. 475) has exhibited a pedestal planisphere. The places of the stars being perforated, when the instrument is held up against a light back. ground, they appear as luminous points. It is 20 inches

ground, they appear as instances points. It is 20 inches in diameter, and designed for educational purposes. Braxir (No. 354, p. 449) has exhibited the model of an instrument called a Periphan, designed for the simple cluddation of solar and lunar phenomena. It is furnished with a terrestrial globe in the centre, and is intended to describe the apparent dinrual motions of the sun and moon, also the daily increase and decrease of the sun's declination, and to determine the time of sunrise, at any place on the globe; the causes of the harvest moon, &c. The model is in diameter 5 inches, which is about a third of the proposed size. It consists of a fixed meridian circle graduated on both sides; on one similarly to the bruss meridian of the common globe, and on the other to show altitudes; a horizontal circle, showing the zodiac signs, &c.; a terrestrial globe, placed in the centre of the sphere, which turns freely on an axis; two small pen globes, to represent the places of the sun and moon, and which slide on circular wires; these wires themselves turn freely in their bearings. This instrument shows turn freely in their cases, and setting at any place exterior to the frigid zones, and various other phenomena of an analogous nature

MATTHEWS (No. 193, p. 431) has exhibited an Astro-MATHEWS (No. 193, p. 431) has exhibited an Astro-rama. This is a concave representation of the heaven-upon n small umbrella, which opens and closes at plea-sure. The material with which it is covered in perforated to show the places of the larger stars. MALLOCK (No. 208, p. 443) has exhibited a mechanical

indicator for teaching geography. This is a contrivance for rendering purely mechanical the acquirement of the first rudiments of geography. A map is mounted upon a lawn.

of this kind, are wasted; they are of no use to the student light framework, a few inches in depth, to permit the studs to work freely. These studs themselves represent cities, towas, &c., on the map, beneath which is placed an index giving the name of each place thus represented. sides giving the name of each place thus represented.
On the same line with the printed same is placed a moveable stud. By keeping down one of the studs on the
surface of the map, a corresponding one in the index instantly rises, the printed name beside it giving tha This is an invention of Mr. Malloch's. The model

which he has exhibited is, he considers, espable of still further improvement. Mr. Malloch also has exhibited a mechanical indicator of eclipses.

Munrous (No. 202, p. 431) has exhibited an eclipse indicator. This is a circular table embodying by the motion of a circle of months on a cyclo-circle, with intervals of 18 years 11 days, the actual results of a previous calculation of the moments of conjunction, both for lunar and solar eclipses from 1647 to 2001. The rules given for setting and reading off the circles being adhered to, the precise moment of the ecliptic conjunction and other partienlars are obtained.

RYLES (No. 190, p. 431) has exhibited an apparatus for showing the chh and flow of the tide. Nawton and Son (No. 212, p. 434). An armillary sphere, mounted on a brass meridian and attached to a brass stand.

ZISKANATE (Austria, No. 132, p. 1014). A chrono-globium and planetarium, a fist board on which are irramed the orbits of Mercury and Venus. The earth and moon are attached to a small rolling carriage, as described in M. Guénal's instrument, by which the rotation of the earth and the phases of the moon are represented. Mars is also made to revolve on his axis by a similar contrivance, viz., by establishing a rolling drag on the orbit.

Dixx (Austria) axhibits a globe of the carth, about five inches in diameter, within a glass sphere, on which are placed the fixed stars. The positions of the sun and moon are marked at any given moment by a simple

RICHARDS (No. 188, p. 431) exhibits a "geographical instructor," a piece of mechanism in which the san (represented by a gilt ball clevated on a wire) is presented vertically, to every point of the earth between the tropics, by a compound movement of rotation on a horizontal axis, the revolving ball being pulled and pushed along it, by a movement to and fro corresponding in extent to the time of the sun's declination at the moment. The law of this movement is given by a train of clock-work, of which one peculiarity is the prolongation of the axis of which one pecuaianty is the protongation of the axis of the globe into a very long pinson, so as to allow the tech of the driving-wheel to act upon it, however far displaced from a mean position. Another, that of the communica-tion of the rotary motion from the primes solite by a book-jointed axis; the to-sand-from motion of the phinon

prolongation of the axis not allowing the cover-work be centrically placed in some point in that direction. DETOCKEE and HOUSE (France, No. 1589, p. 1253) exhibit a uranographic apparatus (erroneously described in the Catalogue as a monographic apparatus); it con-sists of a table about six feet in diameter, in the centre of which is a lamp representing the sun. The earth with the moon attached is carried round on an arm, by a piece of clock-work, the primum mobile of which is not a spring, or any internal power, but the roller on which the mechanism rests, and which revolves as the earth is carried round on the table. This, by a train of wheel-work, communicates to the earth its diurnal motion, preserves the parallelism of its axis, and gives to the moon all the movements imitative of real ones. This mechanism is the invention of M. Guénal.

Diolling.

Newron and Son (No. 212, p. 434) exhibit a spherical snn-dial. The hour is indiented by menns of the shadow of the pole or axis of the sphere being made to full within side of the zodiacal belt, on the outside of which the signs of the zodine are depicted. This is well adapted for a The articles exhibited by Mr. Newton are distinguished by eheapness and good finish generally. LAWBENCE (No. 115, p. 418) exhibits a sun-dial applicable to all north latitudes.

ELLIOTT and Sons (No. 320, pp. 443, 444) exhibit a spherical sun-dial, Dannell (No. 383, p. 451) exhibits an universal sun-

DARNELL (No. 383, p. 451) exhibited a portable instrument for ascertaining correct time by equal altitudes of

the sun.

UHLMAN (Netherlands, No. 83, p. 1147) exhibits an
equatorial sun-dial made of copper, furnished with a
moverable bour, minute-hand, &c., which, by suitable
nechanism and a less, may be made to discharge a piece
of ordance at any time required.

Globes,

Journeyrox, A. K. (No. 188, p. 431), has exhibited a terterital globs, join-less in diameter; it shows the geoogical structure of the earth, indicates the currents of the air, trade winds, monuscus, 6c; Jaso the currents of the cocun, trade routes, and inothermal lines, or lines of equal Davidson, or Elbihardy, his carryed in walmst, and is of claborate and elegant design. A Prize Medal was awarded by the Jury for this globe.

Newton and Sox (No. 212, p. 434) have exhibited a large manuscript celestial globe, 6 feet in diameter. The positions of the stars have been laid down from their positions as calculated for the year 1860.

Several pairs of globes, ranging in size from 12 inches to 25 in diameter, variously mounted in different materials,

rials,

A glass case, containing several small-sized globes, varying from 1 inch to 9 inches in diameter. These are all differently mounted.

A pair of 12-inch globes are exhibited for economy of construction and improvement in the manner of mounting; the pole or axis of each globe remains stationary,

white the horizon is moreable.

Silter globes are exhibited of various sizes, having the meridians and parallels of laditude marked upon them, meridians and parallels of laditude marked upon them, means of filling in the outline map with enumous distinguishing the means of the propose. The globes exhibited by Maera. Newton are placed to the propose. The globes exhibited by Maera Newton are A Price Medal was awarded to them by the Jary, Flatterian No. 200, 19, 431) has exhibited a pair of ter-Flatterian No. 200, 19, 431) has exhibited a pair of ter-

A Prize Medal was awarded to them by the Jury.
Platterist, (No. 200, p. 431) has exhibited a pair of terrestrial globes, and one case showing the various stages of
globe-making. The contents of the case are as follows:—
1st. An iron mondid: by the adoption of iron instead of

wood, the material generally used, all danger of warping is avoided, and much time is consequently saved. 2nd. The axis of the globe. 3rd. The globe in its rough pasteboard form.

4th. A globe coated with composition, resting in an iron semicirele, the revolving in which gives its perfectly spherical form.

5th. The engraved copper plate.
6th. The impression from the copper plates.
7th. The globe pasted and partly coloured.
The globes are well made and finished, and the process

The globes are well made and finished, and the process of globe-making, as exhibited by Mr. Flotcher, is interesting.

Braincoure (No. 677, pp. 468*, 4629*) has exhibited a model of the moon in high relief, the evators, mountains, &c., being modelled from actual observation with a 1-50x reflector, power about 55, and the occasional use of a rereflector, power about 55, and the occasional use of a reonly at the expense of a journey of 35 miles). It inserties commendation, though the scales of high than been pieched to high; and the effect is injured rather than improved being composed of a dark material as artice, thew whole being composed of a dark material as artice, thew whole

Aborno (No. 218, p. 434) has exhibited a globe 25 inches in diameter, with the celestial and terrestrial maps superimposed one upon the other; also a globe of papier-maché,

divided into forty-eight pieces, to be taken to pieces and rebuilt at pleasure; and a skeleton globe, to show how to rebuild the globe in its frame. The power of taking the globe to pieces is convenient for peakage and removal, as well as for the convenient study of any part of it. They are well made.

STORME, No. 204, p. 433) has exhibited an angular terretiral globe, intended for the solution of govgraphical problems. It is adapted for use as a common terrestrial globe, by nanevunig the coge wheel attached to the spindle at the south pole, and substituting the horizon and meridian, the former being servewed in the upright of the stand, the latter being placed upon the globe, the angular motion given to which is designed for the better expla-

nation of the changes of the sensons.

Mr. Stoker also exhibits a spherical geographical elock, to show the difference of time between two given places whose longitudes are known, and is intended to be of

more general use than those ordinarily constructed.

IBNTLAY (No. 213, p. 434) has exhibited a phin globe.

The northern and southern hemispheres are printed on
circular pieces of card-board, each hemisphere moving
under a beaus meridian, which confines it to its place, and
affords the same facility as an ordinary globe for working
problems.

PAXON (No. 191, p. 431) has exhibited a lumrian, with a contrivance for showing the phases of the moon, MARRATT (No. 409, p. 434) exhibits a Russell's globe of the moon, mounted as originally sold, with movement in

brass for exhibiting the librations, &c., in longitude and latitude. Goop (No.146, p. 428) exhibits a new method of illustrating the effect of the earth's distrand motion upon the plane of a pendulum's oscillation. It consists of one end of a radius arm, fixed in the centre of a globe; the other

end being adjustable in a vertical plane, and therefore to any latitude, is made to revolve so that its time of revolution varies as the sine of latitude; the time of the revolution of the globe being its measure.

Entres and Soxi No. 207, p. 430 have exhibited a parist of 1s-inch plobs. They are well flaished.
Ginaner (No. 234, p. 455) has exhibited a parist Ginaner (No. 234, p. 455) has exhibited and inflated with a first. The circuit globe is adapted chiefly for the near of the letters-troom, and may be made of any correction of the contraction of the contraction of the correction of the contraction of the contraction of the correction of the contraction of the contraction of the correction of the contraction of the period of the contraction of th

These globes may be folded into a very small compan. Kivnin B Pransis, No. 194, p. 1058) has calabilited a terristrial globe in rules? A feet in diameter. The execution is excellent; ant only have the clevations been attended to with great care, but also highlands of moderate elevation, and the courses of rivers, have received the same degree of attention. A Prize Medal was voted by the Jury to M. Kummer for this globe.

Gooptran (United States, No. 378, p. 1461) exhibits Inflated globes two feet in diameter, of India-rubber or silk, varnished with the former material. Also Indiarubber maps. Gaosselin (France, No. 249, p. 1188) exhibits geo-

ransas and uranoramas, to be need as lamp-shades; also some very good and distinct celestial globes, in which the figures and constellation boundaries are neatly and precify laid down, so as not to confine the representation of the stars.

ZILERRHATER (Antiria, No. 132, p. 1014) exhibits as small terrestrial globe, enclosed in a glass sphere, on which the celestial sphere and stars, &c., are traced. By means of mechanism the places of the sua and moon among the stars are shown. KELDI, (Austria, No. 131, p. 1014) has exhibited a small

glole of the moon, about 10 inches in diameter; the engraving is of a sepia colour, somewhat faintly tinted, and of a seleno-topographical rather than a pictorial character. Some of the principal names are inserted. It is mounted on a brass pillar, with a horizontal circle showing luranlogitudes, and a vertical one for latitudes; the lunar axis is vertical.

Relief or Model Mapping DENTON (No. 317, p. 443) exhibits specimens of model or relief mapping in its various stages, with all the tools necessary for use

The base of the model exhibited is of slate, a material which muy be procured of sufficient thickness to bear any weight in a horizontal position, may be ground sufficiently thin for framing, and may also be worked to the smoothest ssible surface; thus containing the qualities necessar for the work in question, the use and accuracy of which are dependent on the material upon which the superstruc-

To erect the altitudes represented in the contour map, a simple mechanical process is adopted; slips or ribbons of thin copper, out parallel, of different breadths and of any length, are prepared. Each breadth represents a conany tengto, are prepared. Each tenature re-tour, and is proportioned to a certain elevation: after careful measurement with the altitudes which they are intended to represent, they are each adjusted and secured

in their true position.

The model so prepared is ready for covering with plaster of Paris, a substance well suited to give a finished appearance to the work. After the plaster is dry, the whole about be serutched down until the light edge of each conner ribbon neeps to the surface. The model is thus prepared for the reception of the oil-colours intended to trace upon it the geographical details of the country, Mr. Deoton observes that it is oot desirable to adopt n

scale of less than 198 feet to the inch, and that the vertical scale of height should be carefully proportioned to the horizontal scale of distance. In thus exhibiting as he has done the details of a ebeap, simple, and generally appli-cable method of surface modelling, Mr. Deaton cannot fail to call increased attention to the subject

The Jury have awarded a Prize Medal to Mr. Denton, Schottl. (Switzerland, No. 252, p. 1282) exhibits a model in relief of Mount Sents and the mountainous re-gions around Appenzell, including a surface of about 150 square miles. It is executed with great spirit and distinctness, and is accompanied by a chart on a smaller scale of the same region (scale 1 to 25,000), containing the data for its construction, consisting of a minntely elaborate series of contour or level lines, which covers the whole area, and is carried into every detail. The merit of the execution is enhanced by the plastic material of the model, as well as the apparatus used in its construction,

being of the artist's own invention. This work has been considered by the Jury to merit a Dries Madel

Innerson (No. 459, p. 450) exhibits an exceedingly well-executed relief model of the Isle of Wight, on a scale of three feet to one mile, the elevation being on the same scale. The geographical and geological features of the country are carefully delineated.

A Prize Medal was awarded to Captain Ibbetson. (Medal nwarded also in Class VII.)

Aerial Machines.

GILBERT (No. 234, p. 435) has exhibited the model of a char-volut or carriage drawn by kites. The vehicle is in appearance similar to an open and dooble-bodied phaeton, with this difference, that before the driver is placed an apright spindle, surmousted hy a T handle, the lower part of which is square, and carried under the head of the carriage, and fitted into a small horizontal wheel, round which is placed a band, which communicates with a similar wheel, and is fastened to the pivot of the front axletree. Two kites are designed to act as the propelling power; the upper one is of the ordinary form, and is called the pilot kite; the lower one is so connected with the carriage, that the driver possesses the power of varying its inclination to the wind at pleasure, an oblique direction being communicated to it by two additional lines attached, the one to the right and the other to the left hand extremity of the shoulders of the kite. By these means the plane of the kite can be inclined to the direction of the wind, and the line of traction thus rendered oblique to the direction of the aerial enrrent, so as to enable the charioteer to "haul on a wind," or steer on an angle considerably out of the line of the wind. It has been calculated that two kites, the one 15 oud other 17 feet io length, have power sufficient to draw a carriage containing four or five persons when the air is in quick

This model deserves great commendation, as regards the elegance of its form and the lightness of its con-

It is not impossible that ander some circumstances the application of the propelling power of the kite may be useful, and at times attended with satisfactory results; but it would appear that as upplied to mutical purposes it would be far more efficient than as a means of locomotioo on land, the inconvenience attendant upon which must necessarily be great (the present arrangements not appearing likely in all their applications to earry out the sanguine hopes of their projectors); but as regards its application to vessels, it may often prove serviceable in obtaining the advantage of an upper current of nir moving quickly when all beneath a certain elevation is calm; it is also likely to be of use in signalling from vessel to vessel, and might possibly serve to time of shipwreck to establish a communication with the shore; bot that, with its present mode of manipulation and arrangement, it can take its place among the regularly organized systems of conveyance is without doubt fallacious. Yet it ought to be meutioned that this ingenious and singular contrivance has been so far at least reduced to actual practice by the inventor as to have been exhibited, occasionally, for a great many years, running on the road between Loudon and Bristol; the whole distance (113 miles) laving been performed on one occasion in 1846 by a party of 16 persons, in three such carriages, without accident, and with a speed occasionally as high as eighteen or twenty miles an bour. A member of the Jury recollects receiving from a friend, five and twenty years ago, the account of an excursion performed in such a carriage or carriages

an excursion performed in such a carriage or carriages (as one of a party of nine persons), from Hristol.

LUNKLEY (No. 257, p. 455) has exhibited the model of a rotary balloon, designed to be its own propeller by means of its peculiar shape, viz., cylindrical in the centre, and both ends formed into topering servers. The bulloon floats horizontally, and is intended to rotate by means of a band passed over its centre and worked by machinery in the car. The screw at one end is intended to draw, that at the other, to propel. By shifting the points of suspension, and thus altering the direction of the car, it is designed to guide its course through the air. construction is intended, if possible, to overcome the direct atmospherio resistance encountered by the balloon in its progress, and to cause n more equal distribution of

atmospheric pressure,
GRAHAM (No. 233, p. 435) has exhibited an serial
machine designed to take any direction required; an axle suspended over the ear, nod worked by a strap communication from the cur, carries at either extremity a system of fan sails, with expanding joints, allowing them to assome a more or less conical arrangement. Sails of a similar kind, of the nature of cars, project from either side of the car.

Sand (No. 301, p. 442) has exhibited the model of an aerial machine. It consists of two cylindrical balloons aerial machine. It consists of two cylindrical balloons placed horizontally, with revolving wheels, for propelling two floats, by which to raise or depress the machine at pleasure; and a rudder for the purpose of giving the required direction.

Bell (No. 715, p. 474*) has exhibited the model of a locomotive balloon. The car, which is to the form of a both the car, is constructed with a huoyant apparatus at each ead, so that in the event of its descending upon the sea, the balloon and machinery may be stowed away within it. Mr. Bell has also exhibited an improved valve for a balloon. Also the model of a locomotive parachute,

equipped for service Bnown (No. 713, p. 474*) exhibits a balloon in which the gas expanding as the balloon rises is not suffered to escape, but is husbanded for use by being conveyed into the car, which is made large and hollow to receive it as a sopplemental balloon. The car is also furnished at either extremity with two centrifugal bellows pointing obliquely outwards, by whose reaction, as the wind issues, it appears to be the inventor's design to impel and to

guide the balloon Mason (No. 714, p. 474*) has exhibited the model of a navigable balloon, to be worked and directed by means of sails, helm, and mariner's compass. The model exhibited is npon a scale of a quarter of an inch to a foot. From what may be regarded as its after part, project interally axles, giving a rotary motion to sails of the nature of screw-propellers.

PLUMMER (No. 716, p. 474°) has exhibited the working model of an aerial machine, furnished with wings or sails, put in motion by a clock-spring.

Calculating Machines.

There have been very many attempts to perform num rical calculations by mechanical means, or at least such parts of them as follow simple and rigid laws. Hitherto such instruments have failed to unite correctness in the results, combined with economy of time, and, for the most part, have been limited to the performance of the first two operations of arithmetic.

To make such instruments really useful, they must have the power of executing, by themselves, the successive operations for the solution of the problem imposed in them, when the simple data for this problem have been introduced, without trial, and without guess-work.

The best machine of this kind exhibited is that of Staffel (Russia, 148), which, on examination, seems to

combine accuracy with economy of time, and works easily and directly. The mechanism is 18 inches in length, 9 inches in hreadth, and 4 inches in height, and length, 9 inches in herouth, and 4 inches in height, and consists of three rows of vertical cylinders; the first contains 13, the second 7, and the third 7. Upon each of the cylinders in the first row are 10 notches, corre-sponding with the units 1 to 10. Within each of these cylinders is a small palley, in connection with a lever, set in motion by a silder which, when the cylinder has been turned from either 9 to 0, or 0 to 9, sets in motion toest turnest from either 9 to 0, or 0 to 3, sets is motion the lever, and communicates its action to wheels, which carry over the figures. The palley connected with the cylinder, the furthest from the handle, is in connection with the hammer of a bell. The purpose of this bell is to give warning to the operator, on committing an error, and constitutes a most important addition to the machine, particularly in the operation of division.

particularly in the operation of division. Upon ench of the cylinders in the second row 10 units are placed. These seven cylinders are so fixed upon their axes, that they can bodily be moved right and left, and fixed at any part, so that the cyphers in the two cylinders can be made to correspond. This cylinder is furnished with a spike, which lays hold of and works the third row of cylinders.

The internal communication of each of the parts is brought about by means of a connecting wheel, furnished with nine moveable pegs, which are set in motion by nscans of an eccentric incision in the dial.

The machine is capable of performing addition, sub-traction, multiplication, division, and of extracting the square root.

The operation of addition is performed as follows:-The operation of solution is performed is rotiows:—
By simply placing one line of the numbers upon the second row of cylinders (the index pointing to addition), and turning the handle, till it stops, these numbers are transferred almost instantly to the first row of cylinders, and so on successively, till all the numbers to be added are transferred, and their sum is shown on the top row. In performing subtraction, the first part of the operation in the same as in addition, but on placing the second line of figures on the second row of cylinders, the pointer being placed to subtraction, the handle is turned the opposite way, nr against the motion of the sun, and the difference of the two numbers is shown on the upper

The operation of multiplication is performed by placing the multiplier and the multiplicand on the second and third rows of cylinders, and then, the index pointing to multiplication, the product will be found on the first cylinder.

The operation of division is very similar, excepting that the handle is turned as in subtraction. These several operations were performed accurately,

and with despatch. In the performance of the square root, the following additional mechanism needs explanation. Between every division of the cylinder, in row 2, a small wheel is placed and near it a projecting piece which acts upon a lever; when the projecting piece is near the word "rad" engraved on the cylinder, on turning the handle, the figures increase by 1. This, by other mechanism, is connected with the

other two rows of cylinders. The operation of the square root is performed directly, without any guessing at num-bers; but it is, comparatively, rather a long process. Upon the whole it must be considered that Mr. Staffel has made an instrument possessed of considerable powers, and that great praise is due to him. The double motion of the handle as well as the warning bell are important

Mr. Staffel also exhibits a small mechanical machine for the performance of the addition and subtraction of fractions, whose denominators are 10, 12, and 15. By cularging the machine, this number would be increased, and the power of the instrument extended. The operations were performed with quickness, and with accurate results. A Prize Medal was voted to Mr. Staffel.

THOMAS DE COLMAR (France, No. 390, p. 1196) exhibits the next best calculating machine in the Exhibition, and has combined the two essentials of economy of time and accuracy of results. It is adapted for the performance of the four first rules of arithmetic; and indirectly the square root may be extracted by the knowledge of at + 2ab + b. the results being inferred; but this is not the legitimate

use of the instrument." The instrument is adapted for the multiplication of numbers whose product is expressed by less than 16 figures; and consists of two rows of cylinders, the one containing 16, and the second 8; the former are movemble, the

operation at each step being changed tenfold.

The principle of the instrument is, that multiplication is in reality the continual addition of itself as many times as there are units in the multiplier, and division that of ntinued subtraction of the divisor.

On trying the machine, the number I was almost in-stantaneously taken from 10,000, giving the difference, 9,999, accurately; the performance of this operation is generally a severe test to these machine The number 5,321 was multiplied by 3,256 in less time

than was required to perform the calculation, in the manner following:-The number 5,321 was placed on one series of cylinders, and the number 6 was placed on one of the cylinders of the second row, and on the handle being turned (ip one direction always) the number 31,926 appeared; the apper row was moved through one division, the handle agained turned, and so on, till in a very short time, the number 17,325,176 appeared.

The several operations to which the instrument was

subjected were performed quickly and accurately.

A Prize Medal was voted to M. Thomas De Colmar,

WENTHEIMER (No. 387, p. 451) exhibits several calcu-lating machines, adapted for the performance of addition and subtraction of numbers and moneys, of this and of other countries. Each machine consists of a box, with a metal plote divided into nine indexes, with semicircular notches, under which are placed a succession of holes. Bound the indexes, numbers are engraved, and the semicircular notches are furnished with teeth, and a pointer to insert

between the notches, for the purpose of bringing the notch opposite any particular figure, from right to left. This operation is dangerous, for the notch is liable to slip and ot go home. The instruments are ingenious, but they are much wanting in the essentials of such machines, viz., economy

of time and unerving accuracy. The Jury, however,

* For a description of this ingenious and ascfai machine, see the report of M. Benoit, "Au nom du Comité des Arts Mécaniques, Société d'Encouragement."

SCHILT (Switzerland, No. 59, p. 1270) exhibits a simple calculating unachine, but which can perform the first operation of arithmetic only. Honourable Mention was voted to Mr. Schilt.

ROOKER (No. 340, p. 448) has exhibited a sliding scale of involution, the invention of Dr. Roget. The instrument consists of one fixed and one movemble scale, like a sliding rule. On the slide a line is logometrically divided, the divisions of one half being from 1 to 10, and repeated on the second half in the same order.

The fixed scale is graduated in such manner, that each of its own divisions is set against its respective logarithm on the slider, and, consequently, all the numbers on the slider will be situated immediately under those numbers in the fixed scale, of which they are the logarithms. Thus, 3 on the fixed scale will stand under 100 on the rule, and so on, The instrument is adapted to perform the operations of

involution and evolution. The principle of the instrument is contained in the equation

Log. log. $a^r - \log$, \log , $a = \log$, x.

rom the first member of which a disappears. Two differences of the second logarithms of the power and of the root being equal to the first logarithms of the index, it is evident, that if a scale of second logarithms be engraved on one line, and a first on a line sliding along it, the indexes being read off on the latter, the power will be so on the former."

LALANNE (France, No. 1690) exhibits a calculating rule, constructed upon new principles, consisting of a graphic table formed entirely of right lines, with which all calculations, usually performed by the sliding rule, can be performed to within 1-200th of the true result. The Jary awarded Hononrable Mention to this Exhibitor.

Instruments for the use of the Blind.

HUGHES (No. 401, p. 452) has exhibited a portable typograph or writing macause for the times.

This is a beautiful mechanical contrivance (by no means difficult in use) by which a blind person is enabled thream students in obeying which a single person reminest to print legibly, with ease and rapidity. It is also applicable to printing uniform labels for Museums, &c. (for description see "Illustrated Catalogue"). The following is the manner of using it. The paper intended to be is the manner of using it. The paper in the written upon is placed within a portfolio, one side of which is made of semi-carbooized paper, which, being which is made on the window, serves for ink. Having done durable and inexpensive, serves for ink. Having done this with the first finger of the right hand, any required letter, figure, or point of the index circle is brought to the right side of the lever, the thumb being inserted in the end of which, presses it downwards. This pressure will give the impression of a corresponding type letter acting upon the back of the transfer paper. The next operation is to lift the lever to its numost height, which motion makes the space required for the next letter, and so on to the end of a word. A repetition of the move-ment will also make the space between the words.

Having finished a line of writing, the index circle is pushed luck to the left side of its frame, and the thumbscrew turned for the desired distance between the lines: one whole turn of this screw giving four lines to the

The typograph is about the size of a quarto book, and does not occupy a surface of more than 12 inches square. Its inventor has done good service, having the merit of exhibiting the best machine for the same purpose, it being the most simple in its operations of any in the Exhibition, The Prize Medal was awarded to Mr. Hughes,

TOLLUCT (No. 382, R. 451) exhibits a machine for facilitating the writing of the blind.

Forcaura (France, No. 2820, p. 1187) has exhibited a printing-machine for the blind. It consists of a fan composed of 28 code, terminated at the upper extremity with the letters of the alphabet arranged successively, together with other rods terminated with the various ciphers and symbols required in printing; the lower extremity of these rods is furnished with a corresponding letter, &c., to

* See " Philosophical Transactions" for the year 1815

the one above, but in smaller type. On pressing the larger character at the upper extremity, the smaller letter beneath is proportionably depressed, which causes it to leave its printed impression on a paper previously prepared. By a little contrivance the paper is made to move onwards, to proportion to the successive pressures from above. The exhibitor of this machine, himself blind, has the merit of being its inventor, and he was awarded the Prize Medal.

THOMPSON (United States, No. 26, p. 1434) has exhibited an invention for teaching the blind to draw and This device is simple, and intended to afford a write. means to the blind of sequiring knowledge of various kinds.

The writing tablet is covered with white leather, a material well suited to the purpose intended, as it yields to the pressure of the style without retaining the im-

The style may be made of any hard material capable of receiving and retaining a rounded smooth point. paper should be of a strong and rather firm texture, but at no visit of the Jury was any explanation given, and they are onable to speak further of this invention,

Gall (No. 687a, p. 471*) has exhibited a triangular alphabet for the hlind. This is an improvement on the Parisian, Austrian, and other circular alphabets, and it is probable that adult blind persons may by its means be probate that sourt mand persons may by its means to easily taught to read. A volume containing the Episile to the Ephesians, in the same characters, was exhibited, and Gall's apparatus for the writing of the blind, by means of which they can correspond with each other by post, as described in the "Illustrated Catalogue."

MARCHEN (Austria, No. 139, p. 1049,) exhibits a cir-cular printing machine, by which the blind can print readily with three different kinds of type. On examination by the Jury it elicited much commendation, and a Prize Medal was awarded to M. Marebesi.

Miscellaneous

DUNIN (No. 210, pp. 433, 434) has exhibited a piece of mechanism designed to illustrate the different proportions mechanism designed to maisture no convex of order housen figure. This beautiful piece of mechanism resembles in outward appearance a well-formed human figure, standing erect. It is capable of both considerable expansion and contraction in all its parts. The internal nechanism is completely concealed, the figure externally being composed of a number of thin steps of steel and copper, which overlap each other in proportion to the amount of expansion or contraction exercised. The motion these slips are made to possess is communicated to them by thin metal slides to which they are attached within the figure, the slides being furnished with projecting pins at their extremities. These pins are inserted into curved grooves, cut in circolar steel plates, the curvature of the grooves being so arranged, that when the steel plates are put in revolution by a train of wheels and screws, the slides belonging to the several parts of the figure are expanded or contracted in correct proportion, The external slips of metal are disposed as much as possible in the direction of the fibres of the muscles in the living subject, in which direction the two motions of contraction and expansion are severally performed. Where in nature the fibres of the pectoral muscle converge towards the shoulder, in the figure there is much compound internal mechanism, and very ingenious external arrangement; the contraction of the clast, the back, the shoulder, and the fore-arm, are performed either simultaneously, with great accuracy and just proportion, or each part can be separately adjusted if required. These adjustments, the most compound and difficult to be overcome, Count Dunin, by a new and most ingenious combination of mechanism, has successfully achieved. The dimensions of the figure are subjected to their respective variations by the establishment of a connection between several parts of the internal mechanism and a winding key, by means of eirenlar-headed projections, which being turned to the right or left, gently and gradually effect the contraction or expansion of the adjacent parts of the The motions we have just described, are per figure. formed by the introduction of the winding key into several agertures felt for its reception; one of them in a standard other apertures efficient in the land, no the upon fits the other apertures efficient in the land, no the upon fits the abundance, that area and leps, now for the discontinuous and the contractions of the land are repulsed by an apperture in the area were greated. him by the Jury CHALLIS has exhibited an instrument for calculating the sum of the corrections of the three errors of a transit the sum of the corrections of the three errors of a transit instrument, adapted for the latitude of Cambridge, and for any given S. P. D. The manner of determining these corrections is dependent upon certain geometrical considerations fully detailed in the "Proceedings of the Royal Astronomical Society," vol. z., No. 8. The instru-ment consists of a brass circular plate, moreable about a vertical axis, passing through its centre; on the plate are engraved lines for the purpose of taking account of both positive and negative corrections. At a short distance from the circular plate is a contrivance for guiding the motion of two bars, which carry two fine parallel threads of blackened naspun silk on the surface of the plate. The interval between the threads is made equal to the collimation error by means of a scale engraved on a brass plate, to which one of the bara is attached, and an index is fixed to the brass plate to which the other bar is attached: the two plates are clamped together by a screw; when the two plates are clamped together by a screw, when the threads are set to the required interval, the acrew-head screes for a bandle by which to move them. The circle is graduated, for showing North Polar distances both above and below the pole. The method for performing the calcalations and various details in the construction of the machine are fully described in the paper before referred to

With regard to the degree of scenary of which the machine is susceptible, Profusor Challe botters, that for machine is not problem, Profusor Challe botters, that for stand to form a table of the coefficients of the collimation level and animabile orners, arranged seconding to the North Palos disease, whereit are coefficient for a recording to the north strategy of the contract of

trivance which gives direction to the threads. Should the instrument be required for use in a latitude different from that for which it was constructed, a slight addition is required, but one which the instrument is made to perform itself. Professor Challis observes, that the machine, which requires no little nicety of work, was executed far him by Mr. Simms in a very satisfactory.

A Prize Medal was awarded to Professor Challis.
BLERY (No. 372, p. 450) exhibits a model of Erastothence, as seen through a reflecting telescope of 9 inches
geriuse, 7 feet focal length, and magnifying power 380.
The model is beautifully executed, representing very
enough the benefits of the properties of the price
SPRATT (United States, No. 5, p. 1433) has exhibited lightning rods. These rods, in their cross sections, are similar to the letter X, and are made either of copper or of iron. The points are formed of a compound of platinum, silver, silvex, antimony, bismuth, and tin, mixed in certain proportions. The extreme top being of solid

platinum is calculated to resist atmospheric decomposi-The base is furnished with three angular cast-steel magnets, plated with gold, one being also affixed to the brass connections at every point, for the purpose of facili-tating the silent discharge. Zinc rings are placed between these joints to prevent oxidation.

The fastenings and glass insulators, also exhibited, are designed to afford greater convenience for the attachment of the lightning rods. Owing to this invention being in rocess of registration, the Jury were not able to exam

it at the proper time.

NASMYTH (No. 688, pp. 471*, 472*) exhibits a well-delineated map of the moon on a large scale, which is drawn with great accuracy, the irregularities upon the surface being shown with great force and spirit; also separate and enlarged representations of certain portions separate and enlarged representations of certain portions of the moon as seen through a very powerful telescope; they are all good in detail, and very effective. A Prize Medal was awarded to Mr. Nasmyth.
Fishtza (United States, No. 263, p. 1452) has exhibited a "dial of the seasons," intended to illustrate the sun's

declination at all seasons, together with the coincident effects of light and heat upon animal and vegetable life in

all climates.

The chart is divided into two portions by a line cross-ing the picture horizontally. The upper corner to the extreme left is made to serve as the apex of the triangles, formed by liues drawn from it to the boundary line; these, by their verticality over the tropics and gradually increasing obliquity towards the Polar regions, illustrate very clearly the different amount of sun-light distributed over equal degrees of latitude, and the difference of ter

reture consequent upon this unequal distribution. The chart gives also a comparative view of the equinoctial and solititial angle of sun-light, and is designed to show the comparative rapidity of the sun's declination at the

spring and autumnal periods of the year.

The effect of the messaal distribution of sun-light is shown by a series of coloured illustrations, placed immedistely beneath the boundary line, which, forming the base successively of the various angles, becomes in a measure graduated. The several degrees of latitude between these graduntions contain the principal productions either animal or vegetable, which may be considered strictly indigenous: thus, towards the equator, are shown the palm-tree, the coffee-plant, the tiger, &c.; in the polar regions to the north, the white bear, pine-tree, Laplander, &c.; whilst the temperate latitudes are characterized by the various animal and vegetable productions with which we are most familiar. Immediately beneath these illustrations is another parallel series, representing on the ocean the corresponding ranges of temperature from the tropics to the poles; indicated by the typhoon in its progress, the storm of the temperate latitudes, aurora borealis, the volcano of Mount Heela, &c. The chart, which is carefully executed, and well suited for educational purposes, is 2 feet 9 inches by 1 foot 4 inches. The book accompanying it is of considerable length, but too diffuse for educational purposes. It contains a detailed description of the diagram, and towards the conclusion an interesting table showing the influence of climate upon intellectual development, confining the existence of men of genius to within certain parallels of latitude: it is pleasingly and well written, and, were it within our prescribed limits, fairly entitled to a favourable review.

Levera (Saxony, No. 16, p. 1105) exhibits Weber's electro-dynamometer for measuring the intensity of galvanie corrents.

The instruments employed by Ampere in his electrodynamical researches are not capable of affording very securate results from the friction overcoming, either wholly or in part, the electro-dynamic force to be mea-sured. Under the most favourable circumstances the utmost that these instruments can perform is to enable the feeble electro-dynamic forces to overcome the friction; but in every accurate measurement it should be assumed that the friction is an insignificant fraction of the force to be measured.

In order to exclude friction the electro-dynamometer In order to exclude friction the electro-dynamometer insbesondre wider stands measurgen;" Leipt was contrived by Professor Weber. It consists essentially slso Poggendorff's "Anaslen;" B, 73, 8, 153.

of two coils of wire covered with silk; one of these has of two coils of wire covered with sun; the so were man \$500 feet of copper wire, making 1,200 turus round a sheader ivory spindle, 0.79 inch in length, and t.26 inch in diameter. The ivory spindle on which the coil is wound is attached to a sheader stump of brass, which carwoman is attached to a so-sure stump or trees, when car-ries a circular plane mirror about 1'1 inch in diameter, and also an index about 1'1 inch in length, beneath which is a circle having a graduation of about the same diameter, The two ends of the wire forming the coil are attached to the lower ends of two fine silver wires 197 inches, and 1.27 inch distant from each other, by which the stirrup and coil are suspended, with the axis of the coil horizontal like the biblist magnet, for measuring variations of the horizontal component of the earth's magnetism. The second coil has 980 feet of wire, making 900 coils round a thin hollow brass cylinder 1'73 inch in diameter, and 1-73 inch in length, placed with its nxis horizontal, bisecting, and hisected by the axis of the suspended coil. The two coils are surrounded by a case having an opening, covered with plate-glass, through which the mirror attached to the suspended coil can be viewed. A vertical glass tabe, 1.65 inch in diameter, and about 19.7 inches in length, ascending from the middle of the case, carries at its upper end

insulated attachments for the upper cud of the suspended wires, with adjustments in height and distance from each other, and a motion round the axis of the class tabe. The case is fastened to a circular plate 5 inches in diameter, which has an azimnthal motion on a pedestal 67 inches in diameter, provided with 5 foot series for liorizontal adjustments. The upper end of one of the suspending wires is connected by a conducting wire with one end of that of the fixed coil; the upper end of the other suspending wire is connected respectively with the poles of a voltaic element or battery; the current will hence traverse the whole of both the fixed and suspended coils. At a proper distance is placed a horizontal namer scale of 19.7 inches, the image of which, by reflection, is seen in

1977 Before, the image of winco, by reflections, is seen in the mirror attached to the suspended coil, and viewed through a telescope parcel immediately below the senie, so that the angular displacement of the suspended coil, produced by the mutual action of the currents traversing the two colls, can be measured with great precision. By means of an instrument similar to that exhibited, Weber obtained a most accurate experimental proof of the mutual action of voltaic currents on each other.

The electro-dynamometer serves to measure the intensity of a voltaic current, as does a magnetometer under the influence of a coil through which the voltaic current is transmitted; but the electro-dynamometer differs from the u-squetometer in some very important particulars, the one supplying many of the deficiencies of the other.

In the magnetometer the tangent of the deviation is roportional to the intensity of the current; in the electrodynamometer it is proportional to the square of the inten-

sity of the current A change in the direction of the current causes the magnet to move to the other side of its position of equilibrium; when not acted on by the currents it does not affect the position of the electro-dynamometer.

The electro-dynamometer has been employed by Mr.

Weber to measure the intensity of the oscillations producing sound. By including a magnetometer and an electro-dynamometer in the same circuit, be was embled to determine both the duration and intensity of momentary eurrents, such as those produced by the discharge of a Leyden jar. Results, highly valuable as determining the effects of momentary streams in animal physiology, may be obtained by similar abservations, * The instrument is exhibited by Leyser, to whom much

praise is due, not only for the workmanship, but also for any details which he has introduced in its construction, Excel (Berlin, Prassia, No. 274, p. 1965) exhibits a well-executed wood model of Fresnel's wave surface, in viaxal erystals, and an ellipsoid of three anequal axes marked with the lines of curvature. A Prize Medal was awarded.

^{*} See Weber's " Elektro-dynamische Maasbestimmunger Leipzig, 1850; and

Ward (No. 664, pp. 466*, 467*) exhibits his botsnical cases, which are fully described in the Illustrated Catalogue. A Prize Medal was awarded to him

Dr. La Rer. (Class XVII., No. 76, p. 542) has exhibited various applications of iridescent films for the purposes of decoration, their vivid colours being produced simply by the agency of light upon a thin, transparent film of var-The process adopted to render the film and its reflected colours permanent, together with the method of its application, are as follows:

e objects to be ornsmented, whether insects, shells. hirds, hronzes, paper-hangings, card-cases, &c., are im-mersed in a vessel of water. Upon the surface of the latter, when perfectly tranquil, is dropped a little oil or spirit varaish, which, spreading in all directions, becomes exceedingly attenuated, and reflects the most vivid colours of the spectrum. The varnish being fixed, the object, which is slowly raised in such manner that the film shall which is slowly raised in such mainless tone the firm is nan adhere to its surface, is then placed in a convenient situa-tion, to permit the water draining off. When completely dry the film is found to be firmly stateched, and perfectly iridescent, having lost nothing of its original brilliancy of colouring. This is a beautiful illustration of the produc-tion of colour on a thin transparent surface, by the slight agency of light, such as is transleotly seen in an ordinary soop-bubble. The Jury awarded a Prize Medal to Mr. De la Rue.

VAN SCHENDEL (Belgium, No. 173, p. 1157) exhibits an exceedingly good illustration of the laws of perspective, consisting of a series of objects, of exaggerated forms and dimensions, painted upon a horizontal plane, and two vertical planes. At a certain height above the picture there is a circular hole, cut in a small wooden frame; on looking through which, the objects assume a natural appear-ance, in strict accordance with the rules of perspective, and appear in the most perfect relief. A Prize Medal was awarded to Mr. Van Schendel.

FISHER (United States, No. 263, p. 1452) has exhibited "mathematics simplified," consisting of some beautifullydrawn diagrams, intended to facilitate the study of mathematics. His idea is that of teaching a physical geometry, either preliminary to, or, when no better may be had, instead of the science. His method of nsing the diagrams is by teaching each step by a course of reasoning, and illustrating the laws by well-drawn

Nobody can question the great disadvantage under which students lie who have to apply geometry graphi-cally, if their previous figures have been drawn only by hand; or, what is worse, if budly drawn by ruler and compasses. It is doubtful which of the two is the greater evil-the giving a student ruler and compass as part of his course of geometry, or the making reasoning on badlydrawn figures the only preparation for a draughtsman or architect, &c. This has been often said, but seldom accompanied with any proof of the very satisfactory use which may be made of well-drawn diagrams. Mr. Fisher has the merit of offiring this proof to the Exhibition with some ingenious ideas as to the manner in which the details may be managed. The attention he has paid to one point, vis., the exhibition of areas of given simple ratios under the same and different forms is particularly hereficial. Some of his diagrams are, in this respect, excellent studies for an eyn which is to be trained to correct estimation. His method is particularly applicable for adults possessed of a power of thought, which requires to be enlisted and exercised to make their study agreeable or even profitable.

Mr. Fisber's merit may be described as consisting lu— 1st, the application of the idea of teaching by physical perception, to a wider range of subject than merely making very exact drawings of the propositions to be demonstrated in Euclid; 2nd, in the ingennity of his details; 3rd, the beauty of the drawings. The Jury considered Mr. Fisher deserving Honourable Mention.

PERIOAL (No. 693, p. 472*) has exhibited a demon tion, by the transposition of parts, of the theorem of the right-angled triangle. The square or base of a right-angled triangle being intersected by two straight lines, passing through its centre, parallel and perpendicular to the middle, in order that the globe may be placed over

the hypothenuse, is thereby divided into four parts equal and similar to each other; which, being symmetrically arranged around a square equal to that on the per cular, form therewith a square equal to that on the hypothenuse of the right-angled triangle conversely. sides of the hypothenuse square being bisected, and the points of the bisecting lines being drawn (till they meet) parallel to the base sud to the perpendicular, the hypo thenuse square is thereby divided into four equal quadri laterals, which are together equivalent to the source or laterist, which are together equivalent to the square or the base, encompassing a square equal to that on the per-pendientar. Thus proving that "in a right-sagled tri-naght the square of each side is equivalent to the saw, or to the difference, of the squares of this other twn sides."— Evidst, 1.47.

Exclud. 4. 47. Mr. Perigal has also exhibited a quadratic trisection of the square. The square is divided into nine parts of three different shapes and sixes; so proportioned that, by combaining together one of each of them, they will form three equal squares, each one-third the area of the square formed by the whole nine sections. formed by the whole nine sections. The construction is scarcely susceptible of brief explanation without a

Mr. Perigal likewise exhibits diagrams of the refrogr Mr. Perigal likewise exhibits diagrams of the refrogressive parabols, as derived from the circle, $y = \mathbb{R} \cos \varphi$; $x = \mathbb{R} \cos \varphi$; $x = \mathbb{R} \cos 2\varphi = \mathbb{R} (2\cos^2 \varphi - 1) \cdot \cdot \cdot \cdot 2\varphi^2 = \mathbb{R} (\mathbb{R} + x)$. The origin of co-ordinates at centre of circle, radius \mathbb{R} . The kinematic curve, of which the retrogressive parabola is a limit, was discovered by Mr. Perigal, in 1835, and produced from continuous motion by him in 1840.

Mr. Perigal has also exhibited a lunarian, of novel construction, which he calls a "selenescope;" iotended to clucidate the kinematic effects of the three hypotheses which have been advanced to account for the inhabitants of the earth never having seen more than one-half the surface of the moon, the same hemisphere of our satellite surface of the moon, the same hemisphere or our satetiste being always presented towards the earth. For this purpose, a terrestrial glabe (about 3 inches dismeter) is fixed on a brass stem supported by a brass pedestal. At the bottom of the stem is a fixed wheel of forty-eight techl; and, between that and the podental, a T-shaped brass arm is centred, having at one end a receptacle for a mariner's compass. The other extremity of the arm is grooved to receive four arbors with each a wheel of fortyeight teeth like the fixed wheel first mentioned, into which one of them is made to gear. Another wheel in the middle of the cross part of the T gears into the second, and a fourth at the extremity into the third; while the fifth occupies a position at the opposite end of the cross groove, but does not gear with the other wheels.

All these wheels have the same number of teeth. To the third, fourth, and fifth wheels are attached spindles, each carrying an ivory ball (about one inch diameter), representing the moon, at such elevation that their centres and that of the globe, representing the earth, may be all in the horizontal plane.

Carried by the arm round the fixed wheel, into which it gears, the second wheel is constrained to turn round its axis or arbor in the same direction, driving the third wheel in the contrary direction, by which the fourth wheel is driven in the same direction as that of the volving arm; all with the same angular velocity: while the fifth wheel, not being in gear with the others, revolves with the arm without any additional rotation on its own arbor or axis. A coloured spot upon each of the ivory moons tends to render their relative motions more perceptible and distinct.

By this means one of the moons is caused to rotate on its axis in the same time, and in the same direction in which it revolves; another is caused to rotate on its axis in the same time in the contrary direction to which it revolves; while the third moon revolves about the carth, hat does not rotate round its own axis.

Mr. Perigal also exhibited a gyroscope; an instrument designed to illustrate the effects of revolution and rotstion. On a brass pedestal, an arm, supported at one end by an axis round which it freely revolves, carries at its other extremity a globe (about one inch diameter) representing the earth or thn moon; which is flange-jointed in the axis or centre of motion, and at various distances, as

the experimenter requires.

Granzo No. 100, pp. 410), he exhibited a spherical (Granzo No. 100, pp. 410), he complete the proposation of the property of the p

Mention. "(Indigen, No. 118., p. 187). Converties of vibrating into receive practice. This is due by the interior of a bub-weight on a borismutal arm attached to or threating into receive and the interior of a bub-weight on a borismutal arm attached to propose of the interior of the in

YATES (No. 378, p. 451) exhibits an instroment for squaring the circle. Its principle is, that the diameter of a circle multiplied by 1 25, equals the diagonal of the

square required.

flosuzars (No. 130, p. 422) has exhibited a synchronometer. It consiss of a getta-percha tube, connecting two expansions of the nature of below, of vulcanisation worked by an executive whole in connection with any movement, a partial reasons in created, which being propagated along the tube, sucks in and closes down the other, whose movement parts in action a click acting on the content of the content of the content of the continuation of the content of th

(as a clock) at the other.

COOKE (No. 664a, p. 467*) exhibits closed cases for

Harrass (No. 187, p. 430) exhibits a machine intended to illustrate the effect of certifiqual fores. It consists of a representation of the planet Statura, attached to a piece of string by the edge of its ring, which, whose in a state of repose, is in the same straight line with it, but on a rajid trusting motion being communicated to a rajid trusting motion being communicated to a rajid trusting motion being communicated to a rajid trusting motion being communicated and at right angles to the string, or, in other words, spins round spin in theoret axis.* Dakaysta(No. 382, p. 431) exhibits an apparetus for the detection of either they or robustry constitute, of a

the discretion of either the or rebbery; consisting of a lever, with a centre tamble; and balance weight, while is poised by a small line carried through any portion of a bosses, and factored. On the least pressure the balance weight is ratioed; or if the lipse be out or barral, it will put the property of the property of the property of the put in mattion. It is contained in a small portable box. Naturason (No. 206, p. 430) exhibits a hadeisocope which revolves on pressing the correlary of the eye-pleen downwards, and, therefore, is self-sering whilst the ineventian of the control of the

Kxtour and Soxs (No. 453, pp. 462, 463) exhibit a machine for eleming and polishing disguerreotype plates, portable mercury low; plate-holders; head-rests, with a series of bott and socket joints; glass and porcelain dishes for preparing sensitive paper.

* See Dr. Parr's "Philosophy of Motion" for a distinct lescription of this machine.

TROMON (No. 80, p. 417) exhibits an instrument called an satchromograph, inheaded for the registration of the times of occurrences; for example, to register the time of the arrival and departure of trains in railway stations, &c.,—to note the presence and individuality of guards, and other persons whose absence might incur inconvenience or danger; it is thus of use also in police and public offices, bunking and mercentile bouses, &c.

and points omore, omaxing and mercentule houses, &c., Drra, (No. 370, p. 451) exhibits a circular sinke, divided into as many equal portions as there are days in the month. It is intended to make memoranda of eagagements, &c., that occur on each day; and when properly adjusted at the end of each mouth, and turned day by day, each day's engagements are hought correctly

under notice.

Roran (No. 197, p. 431) contributes Lawson's observing chair, to enable astronomers to observe with large

WATRINS and HELL (No. 659, p. 456*) exhibit Biot's apparatus for the polarization of liquids; a reflecting polariscope; an oxy-hydrogen polariscope; Attwood's

polariscope; an oxy-hydrogen polariscope; Attwood's machine; and a steam-engine indicator, for ascertaining the power of steam-engine. NEWBERNY (No. 460, p. 464) has exhibited a case of medals, the metal precipitated by electro-metallargy, containing—a medal of Alfred the Great; Clement XII,

from a very scarce original: Fins V., from the original in the possession of the exhibitor; and various others. RUNDLL, (No. 438a, p. 461) exhibits impressions of seals, the depth and execution of which are very good, as are the cipbers and arms, particularly when it is con-

are the cippers and some, particularly when it is considered that they have been executed by machinery.

WitLATTS (No. 265, p. 437) has exhibited a registering thread counter, or lines prover, a small instrument designed for the purpose of ascertaining the number of threads in a certain sized pince of lines or silk, by means of an index and a self-registering apparatus. A magnifying less is also attached, for examining the texture of

Fring lens us also attached, for examining the extractor of the naturality to be reviewed, so has architished a gauge for measuring the thickness, and meertaining the weight of meetal and other plates, rods, and how. It up frinciple is the progressive movement of a most accurately ent serve, the progressive movement of a most accurately ent serve, the progressive movement of a most accurately and the theorem of the contract of the contract of the chosenatith port of an inch. The gauge exhibited is no divided that each gave included in the contract of the common per foot of superficial intert brow, whose specific common per foot of superficial intert brow, whose specific 20 lbs. to the square foot is shown. This gauge is conver-

need in me, and Mr. Haward has very wisely adopted the decimal notation in the subdivision. Exone (No. 702, p. 473°) exhibits a photometer for the determination of the illuminating power of gas, as compared with that derived from any other source. The instrument was not tried by the Jury.

CHASTORIATY (No. 304, p. 429) exhibits a hurge model of a machine for recording rover, which is no custrated that the vote shall be recorded without the manner of its disposition being made known, the number of votes given being indicated by the somiting of a bell. The machine spectrum that the state of the contraction of the state of the st

Baza (No. 59c, pp. 431, 449) has rahibited a vacuus gange, furnished with a niding scale; the glass tube being protected by a broaze covering. Also a resum gange, or a single scale of the same particular of the state of the same particular of the same

Banwn (No. 335, pp. 446, 447) has exhibited a patent power-engine, which acts as a water-meter. Its novelty consists in its economy of space; it is 3 feet in height, 2 in length, and 2 in width. He also exhibits a patent water-meter, which is 2 feet in length, 2 in width, and I foot 6 inches in length; stated to keep perfect adjustment ander varying pressure. Also a patent water-meter, stated to work in compressed air, without cock or valve; and two other meters. (See the Illustrated Catalogue.)

LAWRENCE (No. 113, p. 418) exhibits a screw-wrench, espable of being adjusted by a spring, and of being varied in size in a moment. Also a pair of dividers; a hand-drill, intended to supersede the use of the bow-drill, and driven by a erank. A turner's centre-bearing, with friction-rollers to prevent small articles from moving in the lathe, and to enable the lathe to turn easier than in the ordinary way. These articles all seem to be useful,

hut scarcely belong to Class X.

Plant (No. 215, p. 434) has exhibited a self-registering steam-boiler feeding apparatus, intended as a sub-

tering steam-toiler feeding apparaus, intended as a substitute for the common force-pump and regulating-float.

ROCHER (France, No. 991, p. 1226). A tank apparatus, for the distillation of water; adapted to the use of a slop of the line. The workmanship is excellent, but it can, in no respect, be considered a philosophical apparatus.

GREEN (No. 446, p. 462) has exhibited damp-detectors,

fitted up in different kinds of boxes; also several angle-

MERRYWEATHER (No. 151, p. 429) has exhibited a tempest-prognosticator. This consists of a number of bottles placed on an ornamental stand, in each of which it is proposed to place a leech, so as to render available the well-known sensitiveness of this animal to changes of the weather.

Before closing this Report, it may be well to dwell for a short time upon the probable good resulting from the exhibition of the subjects which it embraces. So vast is the field over which it is spread, and limited the time allowed for its preparation, that, in some instances, we have been able only to enumerate, without fully discus-sing, the merits of individual works. No opportunity, for the same reason, is afforded of instituting an inquiry into the comparative importance of the several classes of instruments—an inquiry which would be attended with great labour, from the necessity of gravely weighing and determining the comparative value. etermining the comparative value of results which we have been enabled simply to record.

That the Exhibition will form an era in art and science is to be expected; and that both will benefit greatly from so large a collection of instruments and useful appli-entions from all countries is also certain. That it is not calculated to engender national animosities will be seen hy a review of our Report, which discovers the fact, no less pleasing than anticipated, that every country is characterized by peculiar excellence in some department; and we might venture to predict, that steady and constantly progressive as the advancement of science has been-from the broad basis now offered for the first time, as a groundwork for future improvements-it will receive a fresh impulse and many accessions from new and other-wise unexpected quarters. That the Exhibition has received contributions from individuals of various orades is one of its most pleasing features; as is the fact that a vast field for increase of knowledge, and a means of selfeducation, has for the first time been opened to the artizan. This class of individuals greatly want a knowledge of that which has been done-a deficiency the Exhibition is well calculated to supply, and may thus divert much fruitless labour and ingranity into newer and more useful channels. That there does exist in this class of the community a considerable amount of ability and power of application, is evidenced by the various patents which have been taken out for ideas and inventions, the purchase-money of which has too often been the sole remnueration of the inventors

The Exhibition will make the improvements which have been made in different instruments by various countries known to all; and the means for the acquisition of knowledge, hitherto confined to the few, will, by it, be

placed within the grasp of the many.

Glancing once more at the collection now before us combining as it does a concentration of the labours of eminent men, who have toiled during successive generations for the advancement of science, and whose successful efforts have developed the important principles which have served for the groundwork of modern discoveries, and their beantiful applications to the wants of the present day, we are impressed more strongly than ever with the all-important fact, that much as man has done, both in the physical and scientific world, by a long train of brilliant discoveries, there is more yet left to achieve than has hitherto been accomplished.

As heat, light, electricity, magnetism, chemical affinity, &c., by the recent discoveries of Vulta, Faraday, Ocrated, Seebeck, Wheatstone, &c., have been found to be mutually related, so that best may be said to produce electricity, and vice verse, and so on for all the rest, we may expect that a still more intinate union than that already dis-covered may be found to exist. That things apparently distinct and remote prove to be linked together and inseparable, is instanced by the frequent discovery of intermediate missing links in the continuity of the chain connecting all living bodies, from the most minute, and consecting all living bodies, from the most minnle, and almost inanimate, to man; and which have tended to prove that the powers with which they are severally endowed, and the principles of their formation, have been regulated npon one grand system of gradation, having unity alone for its summit. That the effect of a concen-tration of the sciences of the age must be infinitely greater than that exerted by a single one, is obvious; as also that this concentration and union, once effected, will be productive of vast and universal applications, such as

we dare not even to predict.

The Exhibition, by collecting, within a comparatively small space, almost all the known applications of science throughout the civilized world, is connently qualified for the attainment of this great end, by promoting the advance of science in its various branches, and by infasing a taste for the development of the highest faculties with which man is endowed.

JAMES GLAISHER, REPORTER.

Lewisham, Nov. 1851.

INDEX TO CLASS X.

Nova.—This Report being so extensive, and embeacing a large variety of subjects, it has been deemed by the Author expedient to prepare a special Index to accompany it.

Імтрористном, 243. Subjects included in Class X., 243. ASTRONOMICAL INSTRUMENTS, their construction and workman-Ain 243 etap, 243.

ELECTRO-MAGNETISM, its application to the simultaneous registration of astronomical observations, 243.

NAUTICAL AND SURVEYING INSTRUMENTS, 243. Orries; improvement of optical glass; microscopes; physical optics; lenes and prime, 245.

PROTOGRAPHIC CAMERAS, and their improvement, 243. FIGOTOGRAPHE CAMENA, and their improvement, 243.
FIGOTOGRAPHE, its utility: future importance; present improvement as illustrated by the Exhibition; in connection with art, an applied to the purpose of illustration; its epifection to science; to outermany; to the objection to occur to outer many; to the objectification of matural phenomena; i. to therature, 243.

PHOTOGRAPHS of America, France, England; their charac-teristics, 244.

teristics, 244.
M. Marten's calotypes; Claudel's improvements; Ross and
Thomson's new provess, 244, 245.
Positives on glass; probable causes of rapid advance of
photography, 245.
The last M. Dagmerre, 245.
ELECTRO-MONEY, 245.
ELECTRO-MONEY, 245.

MACRETO-ELECTRICITY, 245 ELECTROTYPE application of Voltaic action, 245.
CHEMISTRY AND CHEMICAL APPARATUS, 246. FIRE ANNIHILATORS, 246.

PLANIMETERS, 246. A14-PUMPS, 246. STANDARD MEASURES OF LENGTH, 246. CALCULATING MACHINES, 246.

[NICKID'S EFFECT OF PATENTS, how exemplified, 246.

CLASSIFICATION OF THE REPORT, 246. PROBABLE OMISSIONS, 246, ASTRONOMICAL INSTRUMENTS, 246.

Probable cause of the omission of large instruments, 246. Excellent workmanship, 246. Avoidance of unnecessary serve connections, 246. Mr. Nimm's improvements, 246. Workmanship of the German instruments, 246. The process of dividing by hand objectionable, 246,

Supersaid by machinery; the obviously of the latter method; graduation of the Westbury circle, 24.

Mr. Bond's electro-magnetic appearance, 24.

Dotaou. Variation transit instrument, 24.

Bond. Tennit instrument; 11a object-glass; conversion

of the axis into a telescope; adjustments; eye-pieces, 247. Simus. Diagonal transit; mode of illumination, 247. Genaun. Field transit instrument; its construction, 247. Dollonu. Double altitude instrument, 247. Sixes. Transit circle; its graduations; supports; illumination, and its advantages, 248.

Ross. Large equatorial; dimensions; support; con-struction, 248. SIMMS. Equatorial; its dimensions, &c., 249.
SIMMS. A small equatorial, without clock motion, 249.
DOLLOND. Portable equatorial, 249.

Bians. Portable equatorial, 249.

Bians. Westbury circle: graduation; microscopes;
axis; object-glass, 249. Smus. Altitude and azimuth instrument; its construetion; adjustment and novelty, 250. CRICKETT. Model of an equatorial stand, 250.

Earge Ann Sons. Universal instrument; particulars of its construction; new application of its clamps; object of the designer; its successful attainment, 250. Professor Miller's remarks on application of elsmps at the centre, &c., 250.

the centre, se., 230.

In equatorial; its telescope and workmanship;

tests to which the telescope was subjected, 251. MERE.

Boxu. Apparatus for recording transit observations by means of the touch ; its prioriples explained, 251. NAUTICAL INSTRUMENTS; their number and re-

spective merits, 252,

NAUTICAL ASTRONOMICAL INSTRUMENTS, 252. Simms. Troughton's reflecting circle, 252, Simms. Troughton's sextant, 252,

SIMMS. 1 FOURTHIES WAS AND ASSAULT STATE OF THE STATE OF tants, 252. MOLTENI AND SIEGLES. Sextants and reflecting circles.

Vaor. A reflecting rirele; improvements by Captain Richards; several sextants, 252. Benon. Sextants and octants, 252,

BEAULIEE. Sextants, 252.
Oravison. Sextants, 252.
Inferial Borsa Works. Two large sextants, 252. Assa. An instrument for great circle sailing, 252.

VARIOUS NAUTICAL INSTRUMENTS, 252.

ARIOUS NAUTICAL INSTRUMENTS, 2021. Enterson. A see-lead; description, 252. Enterson. An instrument for determining distances at sea; description, 253. St. Jounn. Detector compass; squatto velocimeter, 253. St. Jounn. Detector compass; squatto velocimeter, 253.

SURVEYING INSTRUMENTS, 253. Introductory remarks; comparison of respective excellences,

SURVEYING AND LEVELLING INSTRUMENTS. Simus. Transit theodolite; application; dimensions,

Simms. Transit thredolite; application; dimensions, power, &e., 253.
Dollow. Transit theodolite; description; illomination of the lines, 233.
Yaarus. Portable thredolite; theodolite; prismatic compass; optic square; workmanship, 233.
Masnayr. Theodolite; construction to avoid floxure,

PAREIATT. Amendment outside the state of the Barpors, instrument for the determination of distances; rules and conditions for its uso, 254. Baston. Instrument for sketching; object of its design,

954 LIDBELL Sights; lovels; construction, 254.
ADGOCK. Drawing-marbine, 254.
GREEN. Miner's compass, 254.
Cox. Beam draining level; construction and use, 254.

DORNE, Spirit level, 254.
DORNE, THORNTHWAITE, AND WOOD. Spirit level; use

and adaptation: workmanship, 254.
GROKTAERS. An instrument for determining distances,

Da HENNAULT. Miner's compass, 254. LAMBERT. Miner's compass, 254. I.AMBERT. Miner's compass, 254. Becaus. Levelling apparatus, 254.

Bazrracer: Theodolite; mode of graduating; pro-tection of the veruser circle by glass; level; peculiar construction; mining theodolite; descrippeculiar construction; mining tion, 254. Lettre. Levelling pretractor, 255.

KINZELUACH. Surveying cross; description; dissti-meter; Wolliston's gonlometer, 255. IMPERIAL POLYECUSIC INTITUTE OF VIEWA, Level;

construction; improvements; adaptation; ses lovels; pocket lavals; rulers for plane table survey-

ing, 2.5.
SCHEOFTER. Theodolite, 255.
IMPERIAL DORS WORKS. Levelling instruments and stand; workmanship, 255. Astronomical compass; construction; adaptation;

STANDARD MEASURES OF LENGTH, 255,

WHITWORTH AND CO. Standard bar measure; construc-tion; powers; how applied; description of tests; suggestions for improvement, 250. Bathana. Besel's standard measure; construction; mode of making comparisons; delicacy; climination

of arror, 256. Sums. Standard yards; methods of support by Pro-fessor Miller and Rev. R. Sheepshankn; comparison of relative merits; standard scales, 256.

DIVIDING MACHINES, 257.

FIGURE A. Ackland. Dividing mechine; usual method of gra-duation; Mr. Ackland's method divided into three processes; description; example, 257.
PERIPLEX. Line divider; principle and construction,

FROMENT. Divided metre; Fromont's screw; applica-tion of electricity, 257. Conservations are Aura at Matters. Gambey's brass metre; platina metre; description; standard kilogramme; French colon of legal currency; measuring rods and chains; measures of capacity, 257.

BALANCES, 257.

ALANCES, 251. Introduction; varied nature of collection; beauty of work-mankip; Fox's balance; enumeration of the verrous modes of construction not onlybed; Wellaston a method of cleeking oscillation the most simple and efficient;

division of the scale, 257.

Lepwin Otarrano. Balance; beam coated with palladium; balance to carry one kilogramme in each nature; to same to carry one knogramme in each pan; descriptions, 238 rm. Balance; workmanship equal and similar to that of Robinson; mode of adjustment; substitution of links for silk threads, 258.

Balance for small weights; adjustment of the beams by magnetism; method of overcoming fric-

tion, 258.
Managore. Chemical balance; construction of the beam; peculiarities, 258. DE GRAVE, SHORT, AND FANNER. Assay balances; commercial balances; weights; measures of capacity,

Ac., 258. us. Large balence; construction and adjustment; small balance, 258. BACHE. DELECTE. Balance; avoidance of screw adjustments;

adapted for weighing gases; chemical balance; readapted for weighing gases; ehemical bulance; re-marks upon coentraction; assay balance, 259.
COLLOT. Balance; assay balance, 159.
Biransora, Balances for the counter; steelyard; double steelyard; model of a machine for determining pressure; Peso complexe, or weighing-machine; reason for not awarding a Media to M. Bernanger,

203. Sacar. Balance; construction; its peculiarities; suspension of the pans; beauty of workmanship; assay bulances, 250.
ORETLING. Balance; construction and mode of adjust-

ment; attachment of two thermometers; their posttion objectionable; two small balances, 259. REIMANN, mann. Balance; mode of effecting the adjustment of the knife edges; adoption of the circular level,

HOTTHANN AND ERERRARDT. Balances for apothecaries.

2.59. LURIME. Chemical balances: their capabilities, 259. BATKA. Kusche's small balance, 259.

Dollarse. Balance; mode of thecking oscillation ob-

Jectionable, 200.

Browns. Balance; construction, 200.

Browns. Expe balance; form of scale-pans objectionable; small balance; assay balance, 200.

LITTMAN. Balance; usualitution of an additional index,

for a graduated scale considered objectionable, 260. Viatras, Chemiat's balance, 260.

COIN-WEIGHING MACHINES, 200, Difficulties attendant upon the old method of weighing the gold roin; idunstrafaction of the public; difficulty of weigh-ing with nyfficient accuracy; causes as theocered by Mr. Cetter mamerated; overcome by Mr. Cetter is caincurrent. machine; success attendant upon its use, 260.

Description of Mr. Corrow's machine; construction; mode of netting detailed; saving of revenue effected since its use was established in 1844, 260. Sarra. Coin-welghing machine; its principle and con-

struction, 261, DELIVIE. Coin-weighing machine, designed by Beron Seguier; conjectural description of the construction; the machine not being patented, the internal me-chanism was not examined. 261.

enantem was not examined, 201.

Suggestions by Sir John Herschel for the construction of a coin-weighing machine, 262.

Collection of balances in the Exhibition anti-factory; remarks upon the omission of self-weighing muchines for small urrights, 262.

AIR-PUMPS, 262.

Importance of the air-pump; remarks upon construction; observations in forour of those exhibited; Newman, exhi-bitor of the best air-pump, 262. WATKIN. Double-barrelled air-pump; Grove's prin-

ciple, 262. KNOHT AND SONE. Air-pump on Siemen's patent, 262.
Valley AND Son. Air-pump; new construction; small double-barrel air-pump, 262.
Herwood. Rotary table air-pump, 262.

HETWOOD. Rotary table air-pump, 262.
GOULETT. Air-pump, 252.
LAND. Single-barrelled air-pump, 262.
YEATES. Double-setting air-pumps, 262.
Bavas. Double-settion air-pump, 262.
Bavas. Double-barrelled air-pump; form of construetion objectionable, 263. EVIL Double glass-barrelled air-pump, 263. DELEVIL. Double glass-barrelled air-pump, 263. Nusex. Double-acting single-barrelled air-pump, 263.

OPTICAL INSTRUMENTS, 263

PIICAL INSTRUMENTS, 300: Importance of the televicy; a solid substance substituted by Wray for finit plans i optical plans in the Ethibitors; Kimma object planse; Chance's disc of plans; Pougact; Buyerle's Bertrand i Dubour-Solid; ethibitor of physical optics is microscopes; highlocotes, by. 200.

TELESCOPES, 263,

Valley Am Son. Apparatus for Gregorian telescopes; details of its construction; remarks upon the advantages of the Gregorian form of telescope; portable

tages of the Gregorian form of telescope; portable Gregorian telescope; construction, 263. Ross. Telescope; object-plans of English flint glass; tests to which it was subjected, 264. Callonan, Telescopes for decressiaking, 264. Salmon. Telescopes for decressiaking, 264. Berlancoco. Helbecting telescope, 264. Rosellancoco.

BRURARDON. Helbeching telescope, 264.

BOTLE. Reflecting telescope, 2 as-fill substance substituted for fill glass; results of the test to which it was subjected, 264.

WARLES AN HILL. Telescope, 264.

MARRATE. Achromatic takescope, 264.

HARRATE. Achromatic takescope, 264.

HARRATE. Achromatic takescope, 264.

man Arn Sox. Double-image terrecope, 700-100x, Telecope; the olipe-ignas of rock crystal; particulars necessary to attend to in working rock crystnij; Ilugycan formais; telescope supported upon M. Cauchola' stand; telescopes with terrestrial and celestial eye-pieces. M. Blot; 204. nars. Achrematic telescope; introduction of a filtot less between the erown lenn and joint focus; suc-LEDREN.

cessful result of test, 264.

Kinzinacii. Dialytic telescope, 264.

Busca. Achromatic and other telescopes, 265.

MICROSCOPES, 265. Introductory remarks upon the large collection exhibited; importance of the microscope; application to geology; previous to the medical profession and to every class of noticty; instances of its powers of detecting adulteration both in grain and in textile fabries; construction of the first object-plane by Tulley; Dr. Goring's opinion; describle to trace the consess which here as conduced to its disturble to trace the masse which have a readered to the admission clusted the suplication of the uniformal indiper-glass to the compound microscopy: Sollique's micro-soppe; John's in beta Mr. W. Talley; Jr. Going; a necorgid combination of the least the result of Mr. and constructed by Mr. Rau; we show of Mr. Rau relative to the front leas; a war supprison by Mr. Little certrical on by Mr. Rau; which is the first Rau; Smith and Bret; their mercaine servicine; results are proposed to the compound of the con-trolled supprison of the Three Brecomies servicine; results leave greatering the Bretan Southern programs of the Three Brecomies per-turbable supprison of the Three Brecomies; Hi distances wholds supportions of Sir Dural Breaster; Williamon's condenser; application to the microwaye of the apparatus for the polarization of light; low price of the interamente exhibited by Wener, Smith and Boch; combinations and mitted for educational purposes; continu concerning the activation of the angle of apprivacy; remarks upon academistion of high power and extremely extended angle; of aperture; sporture; observations upon the qualities essentially usits to the stand of a microscope, 265.

regulars to the stand of a microscope, 250.

8. Microscopes; angular apertures of the objectglasses; quality of the object-glasses, 266.

ITM AND BECK. Microscope; observations upon the
stand; lever motion of the stage the best yet applied; engular sperture of the object-glasses; well corrected

for spherical aberration; new form of cabinet; two tables with revolving tops for the convenience of several observers. 256. several observers, 256.

Valler and Son. Microscope; stage moved by parallel rods; microscopes for the reception of vials containing animalcules, aquatio plants, &e.; microscope for beginners; remarks upon Varley's lever stage, 256.

Vicen Microscope stard with a life and the property of the parallel property of the par

Kino. Microscope stand, with micrometers and gonlo-meters; description; workmanship; mode of illu-

mination, 266. remann. Achromotic microscope; remarks apon the PRITCHARD form of Instrument, 267, n. Microscope with chain-and-spindle movements,

Pillsenen. Microscope stand; its large size objectionsbio; small microscopes, 267.

Jacsson. Plain and exavated slips of glass; sections of tubes, 80., 267.

Husson. Microscopie objects, 267.

Hurson. Microscopic objects, 291.

Hirr. Injected microscopic objects in illustration of the atility of the microscope, 267.

Potrow. Microscopic objects; drawings in illustration,

267.

Microscopic objects mounted in guita-perche STARK. Cells; slides for opaque objects, 267.

SHABE. High power leases, 267.

SHABBOLT. Sphero-annular condenser for the concentration of light; remarks upon the principle of the

condenset, 267.
FIELD AND SONS; ELLIOTT AND SONS; WATRING AND
HILL; ARRAHAM; GERTIN, exhibitors of micro-

scopes, 267. scopes, 267.
Inferiority of the French object-classes. Netchet's the
best, but inferior to Ross, Smith and Beck; spherical aberration not corrected; a dissecting microscope exhibited by Natchet, 267,

scope exhibited by Natchet, 267.
BERNARA. Microscopes, 267.
CHINALIZIN. Distroscopes, 267.
CHINALIZIN. Distroscopes, 267.
MILLA MICROScope; remarks upon its mechanical construction, and object-plasses, 267.
HALAHY. Microscope; Huggenian cys-pieces, chromatic and spherical aberration not corrected, 267.
Pers. Distroscope, 367.

Remarks upon the uses of the microscope; an important illustration of its utility afforded by Leonard, 267. List of subjects selected by Leonard in illustration of

the powers and utility of the microscope, 267.
Remerks upon their asceution, 268.
Torriso. Cases of microscopic objects; Mr. Topping's
remarks upon the best medium for monating; ob-

servations upon the method adopted by Mr. Topping,

loragony. Microscopic objects, 269, ioneny. Tracings of parallel lines on glass; constitute admirable tests for object-glasses, and tend to confirm Nonent. the undulating theory of light, 268

LEXIV. Dies or minute copies on silver and steel, of

verious devices; remarks upon their minuto size which render them almost invisible to the naked eye; details of the dies exhibited; remarks upon their utility, 268

OBJECT-GLASSES FOR TELESCOPES, 269. es. Acbromatic object-glasses; remarks upon their colour; Mr. Simms method of determining the corrections required for achrometism; specific gravitles of the flint and crown glass manufactured by Chance

and Co., 269 marks upon Mr. Simms' new invention and arrange-ments; e Council Medal awarded to Mr. Simms by

the Jury, 203.

The Jury, 203.

Thath. Object-class, 209.

The Jury, 203.

Athromotic plans, crown and flist plans for which, made by late M. Guinard, with curves after Mr. Str. J. Herscheft's method, to show stars of 11th GODDARD.

magnitude, 269. Branz. Solid eye-pieces; their construction; Sir David Brewster's achromatic sphere; Sir David Brewster's remarks apon achromatic eye-pieces; the incon-rendence of the positive eye-piece now is use; examination of the eye-piece by Mr. Glaisher, 969

OPTICAL GLASS, 270. Examination of the disc of plans exhibited by Mr. Chance; gratiemen present at the examination of; description of tests to which it was subjected; satisfactory results,

270. Mažs. Specimens of a new kind of glass; its compounds; suggestis discs of glass, 270. suggestions to manufacturers; prisms;

Remarks upon the achromatic union of the spectrum, 271, Daguer. Disca of flint and crown glass; M. Daguet's prucess, 271.

Lenses and prisms, 271.

Lenses and prisms, 271.

Barrang. Lenses of various forms; lonses ground on curves of different foci, 271. curves or different foci, 271.

JAME. Priess of crown glass; discs of filmt glass; plane and coursevo reflectors, 271.

BETATATE. Nicholi's prisms; crystals; variously cut prisms, 271.

BURGE. Various prisms, 271.

LIGHTHOUSES, 271. GHTHOUSES, 271.

CRANCE. Design for a lighthouse; improved method of reflection; arrangement of the prisms; system adopted by Fresnel; description of apparatus; colour of the glass, 271.

WILLIAM. Apparatus for a lighthouse, very similar to that of Chance; new adjustment of frietion rollers,

PHYSICAL OPTICS, 272.

Draosco-Sozza. Silberman's hellostat; principle; sac-charometer; moda of using it; Bravais's haloscope for showing halos, parhellons, and meteorological phenomena; instructions for producing the several appearances; various instruments for physical investigation, 272.

SPECTACLES AND OPERA-GLASSES, 272. FERTALIZA AND OPER-AGLASSES, 722.

Beaming upon the mire of the species including in port of the protein school of the protein schoo

BRAHAM. Spectacles, 273. CALLAGRAN, Steel speciacles, 273. CALLABRAS. Corcus processors, 213.
Solomors. Eye-protectors, 273.
Westranows. Spectacles; a pair of sketching, 273.
YEATS. Spectacles, 273.
HERSEL Spectacles for rectifying obliquity of vision,

spectacies for preserving the cycsight (concerva-garden-mes), 273.

Remarks upon M. Henri's improvements, 273.

POULLOY. Specially; metallic woven speciacles Leaven. Cheap speciacies and opera-glasses, 273.

Propert. Opera-classes, 273. Opera-glasses, 273.
 Opera-glasses, 273. Besov. Bescu. Speciacies; opera-glasses, 273. Latisus. Speciacies, 273.

LATINE. Speciacies, 273.

BAHAN. Speciacies, 273.

PLAUSIOL. Speciacies, 273. Pics. Spectacles, 273.

DISSOLVING VIEWS APPARATUS, 273.
ABBAHAM ARD Co. Trinopirio prismatie lantern; description; dioptrie prismatic lantern, 273.
CARPENTER AND WESTLEY. Phantasmagoria lanterna; lenses; subjects for dissolving views, 274.

HORNE, THORNTHWAITE, AND WOOD, Dissolving apparatus for the oxylaydrogen lime light; novelty of its arrangement described, 274,

PHOTOGRAPHIC CAMERAS, 274.

General remarks upon the comera; being shetch of its advance-ment from the dote of its disovery to the present time; spherical observation carefully corrected by Mr. Ross. by M. Himport; construction of the object-glasses exhi-bited. 214.

Cameras, with single and double acpromatic object-glasses, 274.

Henneman and Malone. A camera by Ross; descrip-

tion, 274. Knight And Sons. Cameras; construction and adjustments, 274.

Hoave, Thoavriwaitz, ann Wooo. Camera; double actromatic object-giass; fine specimens of chemicals used in photography, 274. Caarber. Cameras; multiplying camera; description,

AATTS. Portable photographic camera; a flexibic cloth body instead of one of wood, 274. WILLATTS.

Vanier And Sov. Single reflecting cameras for en-larging or reducing copies, and for sketching from nature upon stone, 274. ARRAHAM, AHRAHAM, AND Co. Portable sketching

camera, 275.
LGNIOL, Camera, largest in the Exhibition; great

defalcation of light; larger eameras have been con-structed, 275. SCHIENTZ. Camera; sides of the field very obscure, 275. HARRISON, Cameras; double achromatic object-glasses,

ALBERY. Camora; double achrematic object-glasses, Bocast Dr L'Istr. Camera lues for copying drawings; method of using it, 275.

PHOTOGRAPHIC GLASS, 275.

CHANCE AND Co. Discs of glass for slaguerrectype and talbotype apparatus; its density and refractive power, 275.

Benox. Glasses for dissolving views, 275.

PHOTOGRAPHY, 275. General remarks upon photography; not 3rt ottained the ronk of a science; its pursuit likely to elucidate principles roads of accience, its parenist likely to checidate principles on present molecular photography set in its impact; the study of the prismatic spectrum, per us, recommended; it report bet, as shown in the Exhibition, this study, has been an little followed up; Mr. Claustet alone has done on; the method adopted by Mr. Beas in the construction of his conserva; the present orbibition of photographs will prohaps from a real from which to dotte many improvements; rupid advance of photography; an illustration of this rapidity; formation of doouerreetype establishments in Lowlon; amount of daily receipts on their first estain London; amount of daily receipts on their first set-liabinent; voltage process and its employment by Mr. Collen; injurious effects of the employment of the brash; Mr. Clanded: perfection of the processe; sens the first to perceive the advantage of employing subsidiary adjuncts for backgrounds; pleasing results of Clauded's multi-plying cumera; most on of those greateness who have materially extitative to the advance of photography;

M. Fizeau's new provess of engraving and preserving the departrion image, 275. ures ; M. Bayard's velebrity; Hennemon and Malone

exhibitors of tallotypes; advantages attendant upon Mr. Tulbet's process; M. Arago's opinion concerning the investigation of the photographic processes, 276.

DAGUERBEOTYPE PICTURES, 276

CLAUDET. Non-inverting portraits; distinguishing merits of Mr. Claudet's pictures, 276. Difficulty of hiending colour with photographic works; Claudet a dynactimometer and forimeter; specimens illustrative of the different refrangible rays, 276,

Kilin in. Coloured daguerreotypes; individual merita specified, 276. MATALL Unroloured daguerreotypes; their charac-teristics; subjecta selected for illustration; crayon

daguerreotype, 276.

3raab. Enamelied daguerreotypes, 277.

Lanoche. Daguerreotypes, 277.

Colorranges. Coloured daguerreotypes, 277.

VOIGTLANDER. CONTLANDER. Coloured deguerreotypes, 211.
Sairvirus and Le Beau. Coloured deguerreotypes, 277

PAINE. Photographic pictures to show the progress of the art, 277.

THEE. Coloured deguerrectypes, 277.
CRADIOCE. Photographic copies of orgravings, 277.
American deguerrectypes; their merits and character, 277.
American excellence usualed by level influence, 277. Lawsever. Daguerreotype portraits; special mention of individual works, 277.

Bany. Daguerreotype pertraits; beauty of execution; remarks upon their backgrounds; several works Particularized, 277.

WHIPPLE Dequerrostype of the mone; a new cra is astronomical representation, 277.

MATALE, Nulpets witch composa bis American col-lection; same characteristics as shown in his British collection; particular excellence specified,

277.
Daguerreotype portraits; peculiar excellences,

MEARE BROTHERS. Series of daguerrectype portraits; excellent arrangement of light and shoile, 277.
PRATT, RICHMOND, ARR CO. Daguerrectypes, 277.
WHITTEREST. Daguerrectypes of the Falls of Niegara,

WHITTENST: Impurrencype: CAUT: Daguerrencypes, 277.

Roor. Daguerrencypes, 277.

Roor. Daguerrencypes, 277.

Roor. Daguerrencypes, 277.

Forvars: Ann Powran. Daguerrencype silver of Cincinnation, 277.

Garcell Remarks upon the French dispurrencypes; 177.

Garcell Remarks upon the French dispurrencypes; their excellence, 277.

THEARI. Dagmerreotype view of Lyons, 278.

MALCONELE. Coloured daguerreotypes; their exceliences more nearly allied to art than to science, 278.

SABATIES. Deguerrootype portrait of large size; remarks upon the excellence of its execution, 278.
PLAGNIOL. Daguerrootypes, 278.
Gooss. Coloured daguerreotypes, 278.

Geess. Coloured algoriers types, 278.
Kousza. Dagorierotypes, 278.
Kousza. Dagorierotypes, 278.
Kousza. Dagorierotypes, 278.
Ven Mustous. Dagorierotypes, 278.
Takapurtage, Cadorira, 88. septement, 98.
Becauz. Calorypes of great heauty. 186. Bookhi's abBecauz. Calorypes of great heauty. 186. Bookhi's abBook and Tonosoos. Talberynes abblect of illustraphotograph and process by fatch dedaled; albominous process, 278.
Hun and Ashanton. Take.

III.L. AND ADAMSON. Talbotype groups; striking effects of light and shade, 278.
IERNIWAN AND MALORE. Talbotypes on paper; subjects exhibited; their merits; carellone of the coloured portraits; appelimens of the dynatotype and chrysotype of Sir. J. Herschel; chromotype of Mr. Hunt; various talbotypes, 279. Colle. Sun-pictures on paper, 278.

Owr. Calotype pictures, Inniscape and wood scenory; advantages of Mr. Owen's glass spreader, 278. Collet. Calotype pictures, 279. Rippingalas. Talbotypes; photographs from paper

negatives, 273. BINGHAM.

negath es, 273, swan as a constant of the state of the st

BAYARD. San-pictures, public buildings of Paris; calo-type of Venus and Cupid, 279.

FLACHERON, Sun-pictures; excellences; nocurate repre-sentation of superficial texture, 273. LE GRAY.

Sun-pictures, 279,

Le Guar. Som-printers, 273.

Brown Le Store, Chaptery: ethic articles from negliBranch and Chaptery: ethic articles from negliBranch Blackwitzer. Tallodype fetteres; a new

of autography, 279,

MAGNETS, 279. Remarks upon the improvement of steel magnets; attention paid by Hearder to the personnent magnetic powers of

pain by Iremore to the personness magnetic powers of out-iron, 220.

Dr. Scoredy's experiments upon the magnetic properties of outsiron's IPr. Scoredy's results, 201.

Mr. Hearder's experiment upon the magnetic properties of

cost-iron, 200.

Lourman. Permanent magnets; results of experiments, 280.

HENLEY. Permanent magnets; results of experiments, SHAW AND Sox, Two magnets, of 9 ib, and 76 lb, weight respectively, 280,

HEARDER. Cast-iron magnet; its construction; obse vations upon the relative powers of the magnetic plates when separated; permanent horse-shoe steel magnet; its weight and power, 2%. Rewesta. Carbonized cast-iron magnet, 280.

MAGNETICAL INSTRUMENTS, 280 ORE. Photographic apparatus for the self-regis-tration of the magnets; description of apparatus; chemical solutions for the preparation of the paper,

ebemical solutions for the preparation of the pro-280.
Wilton. Fox's dipping needles, 281.
Paures ano Sox. Pocket compasses, 281.
Garra. Magnetic gan-dist; pocket compasses, 281.
Yaaris. Prismatic compass, 281.

ELECTRICAL INSTRUMENTS, 281.

General remarks upon the necessity for an inexpensive instru-ment adapted for the observation of atmospheric electricity. Application of steam-power to the production of electricity, 281.

WESTNORELANO. Gutta-percha electrical machine; de-scription, 281.

Remarks upon WATERS AND HILL temarks upon the application of gutta percha, 282.
WAYKINS AND HELL. Electrical machine; construction;
galvanometer; thermo-electrometer, 282. DELECIA. Electrical machine for medical purposes, 282. MEINO. Hydro-electric chain batteries, 282.

Theamo-Electricity. Introductory remarks on results of Lubeck of Russia's discovery, in 1821, of electric currents generated by contact of two different metals in heated

state, 252. ion. Thermo-electric battery; construction, 282. ICFFMANN AND ERRHARDT. An apparatus for showing HOFFMANN AND ERERHARDY. the earth's magnetism, 282.

APPLICATION OF FLECTROMAN NETSISM TO THE MOVEMENT OF MACHINES, 202.
Remarks upon Professor Gerical almostry, and the opposition of a cutter force proleced submarks attending flament, in the macrossi of machines, 202.

John Markett of the macrossi of machines, 202.

John Markett of the professor of the macrossi of machines, and the macrossi of machines, 202.

John Markett of the macrossi of machines, 202.

John Markett of the Markett of magnetic force of the macrossi of the

KRIGIT AND SON. Electro-magnetic engine; simple in

construction; electrical machine; its construction, 283. WATELES AND HILL. Electro-magnetic engine; its prin-ciple and construction, 283.

ALLEY. Electro-magnetic railway-train slarm, 283.

Carseweat. Electro-magnetic engine for the production of motion, 233. FROMENT, Licetro-magnetic engine; Its construction,

233. Barros. Electro-medical apparatus, with double cur-

rent, 283 HAORTH. Electro magnetic engine; plan of improved arrangement; detailed description of its notion,

ELECTRIC TELEGRAPHS, 283,

Jacctus Teleographis, 200. JAMES STEWART, 22 Breeknock Crescent, Camden Town; Planoforte Manufacturer. William Telrondy Dublin; Organ Builder.

THE Jury of Class Xa. having concluded the examination of the various articles confided to their inspection, and having mude their awards, have now, in accordance with the desire of the Royal Commission, to offer the result of their labours in an official form, which it is hoped may hereafter serve as a faithful and importial register of the state of musical instruments, and their manufacture, in the year 1851.

When the very large number of articles (righteen hundred and fifty-seven) in this Class, displayed in the Exhibition, is taken into consideration, the utter hope lessness of doing adequate justice to all exhibitors in such a Report as this is at once apparent. Nevertheless, the Jury are desirous to record the unfeigned satisfaction and pleasure which they have derived during their inspection, from becoming acquainted with some of the most heautiful specimens of musical instruments of all kinds ever manufactured; and it will be their consolation to know that the restriction which they are necessarily obliged to make in the length of their Report will be amply compensated by the increased intelligence of the musical public, who have not failed to visit those articles, and to reward them, in their own opinion, according to the merit displayed.

Organs.

In this department the Jury, after due deliberation, determined to award the Council Medal to the following makers:-

M. P. A. Duenoquer, Paris, Mesers, Hell and Son, and Mr. H. Willes, Loudon, for their introduction of a fundamental pneumatic principle into the art of organ-building, by which means the great exertion hitherto required on the part of the performer on a large organ is no longer uccessary, the labour being transferred to the bellows-slower; and thus the largest organs may now be hullt without exacting from the performer more physical strength than he is obliged to use in playing one of the amullest size and compass

The following are the explanations of the various approvements illustrated in the organs which have been insprovements illustrated in the organs which have been exhibited by the three above-mentioned builders, Messrs. HILL, WILLIS, and DUCKOQUET.

The organ by Messrs, Ritt and Sox has two manuals; compass C C to F (54 notes). Pedal organ C to E, 24 octaves.

The great organ contains 10 stops. The swell organ contains 5 steps. The pedal organ contains 1 stop.

In this organ the following improvements have been introduced :-

1st. The "Tuba Mirabilis," a stop of great power and fulness of tone, the invention of Mesers. Hill. It is voiced on a much heavier pressure of wind than ordinary, namely, 11 inches, the ordinary pressure for church organs being from 2) to 3 inches. This stop has a separate bellows and woud-chest, and has never been made

by any other huilder. 2nd. The 'wind-tranks," for conveying the wind from the bellows to the wind-chest, are abolished, and hollow posts and framework substituted, thus effecting a great saving of room, and simplifying the general construction of the mechanism.

3rd. The application of a new valve to the great organ, the invention of Messrs, Hill, who first adapted it to the large pedal pipes in the York and Birmingham organs; it being found that such large pipes could not be supplied with sufficient wind by means of valves of the old construction, without increasing the resisting surface to such an extent as to render it impossible to open them by the pressure of the fingers, or even the feet of the performer. The above-mentioned valve reduces the pressure, or rather resistance, to one-fourth of that presented by one on the old plan, and admits at the same time double the quantity of wind. This valve has now for the first time been adapted to the manuals, to which it insures equality

as well as lightness of touch.

4th. The stops and sliders are shifted by means of the pneumatic apparatus; so that in changing the stops a key has merely to be pressed down, instead of drawing them off and on by means of draw-rods.

our mad on sy means of draw-rous.

These keys act upon a set of valves which admit compressed air into a series of small bellows acting directly upon the sliders.

There is a small bellows at each end of a slider, one for pushing the stop on, and the other for taking it off. Upon one of the keys being pressed down, the valve is opened, and the bellows becoming anddenly inflated by the admission of the compressed air, a mutive power is obtained sufficient to move the slider late its required position.

5th. The composition pedals are exceedingly simple in their construction, the performer having merely to move the keys above mentioned, which being very light are moved with great case. The usual heavy iron-work is entirely done away with, and the action much simplified and condensed.

Mr. H. Willis's argan consists of three rows of keys, from C C to G (56 notes), and two octaves and a fifth of pedals, namely, from C C C to G (32 notes

The pnenmatic lever, as improved by the builder, is oplied to the great and swell organs; the choir touch is lightened by pneumatic contrivance, counteracting the resistance offered by the pressure of the air, and a re-markably effective valve is applied to the 32 and 16 feet wood stops in the pedal organ, called the patent cylin-drical pedal valve, though used for other purposes in the same instrument. The bellows supplying the swell organ are placed in the box itself, and give two pressures of air.
The whole of the draw-stop movement is centred in a

peculiar way-also patent, The various organs have applied to them a novel and

convenient movement for arranging the stops, called The swell-box is constructed of 3-inch pine plank, with double front, upon the Venctian principle; the shutters of which (40 in number) are made of 2-inch pine, with

leathered joints, &c. The instrument will stand in a height of 27 feet, as at present orranged, and is 25 feet wide, by 22 feet 6 inches in depth; but it is expable of extensive alterations at a

iffing expense, should they be necessary.

The following is a synopsis of its contents:-

```
Store.
Great organ, C C to G -
                                    90
Swell organ, C C to G -
Pedal organ, C C C to G -
                                    22
                                    14
Choir organ, C C to G -
Conplets -
```

Observation 1. - The whole of the stops extend throughout the compass of the various elaviers, except the orchestral oboe, which, from its close resemblance to

that instrument, is only of the same compass. Observation 2.—The plan of placing the bellows in the abstract swell overcomes all the evils resulting from con-finement of air by closing the front, thus the pipes remain in tone. The other advantages are obvious.

The following is a description of M. Ducnoquer's organ.
The instroment is composed of 20 stops; with two
manuals and German pedals. Each manual comprises
five octures, from C C to C, and the pedals two octaves,
from C CC to C.
There are ten stops on the lower, or

great organ manual. Observation 1.—All the reed-stops on this manual are established on a separate wind-chest, and supplied with air at a greater pressure than that of the dispuson stops,

Observation 2,-The reed-stops and the furniture can be withdrawn at pleasure by means of a pedal.

There are eight stops on the upper or awell manual, Observation 1, - All the stops on this manual are inclosed in a swell.

Observation 2,-The upper monual can be coupled with Observation 2.—The upper monusal can be ecopore who the lower in three different woys, namely, in uniton, octavo obove, and octave below. The complets are brought into play by pedals, and in consequence of the npphenation of the poeumatic lever, do not add in the slightest degree to the weight of the touch, whatever may have the number generous of the control of t be the number employed,

Observation.-The pedals set at pleasure on the bass of the great organ by a coupler. The instrument is contained in a hondsome oak case in

the Gothie style. It measures 30 feet high, 12 feet broad. and 6 feet deep.

All the mechanical parts of this organ are constructed

of the best materials, and executed on the most approved principles. In addition to many late and important improvements, will be found peculiar dispositions, which have been adopted with a view of enabling it to compete, both in power and variety, with instruments constructed on a much larger scale.

Connoisseurs will, an doubt, be struck with the portionably greater number of reed-stops introduced into M. Ducaoquer's organ, compared with organs of the ame dimensions built either in England or Germony. The object has been to abtain a fuller orchestral effect: many of these stops, such as the obse, cor-Auginis, and bassoon, being particularly adapted for the execution of solos; while the trumpet, clarion, and double-trumpet stops give unusual energy to the fortistimo passages,

It may, however, be necessary to observe, that the dia-posons, which can slone give to the organ its essential character, have been by no means neglected. Of these there are two of 16 feet, and eight of 8 feet, five of which commence on the CC. It may be added, that among these stops are two of remarkable power and brilliancy, the harmonic flute and bell dispuson; the latter of recent invention, never having yet been introduced in any other

This instrument, hall expressly for the Great Exhibition, for the special purpose of representing the actual state of organ-building in France, is equally suitable either for a church or a large concert-room

A fourth Council Medol was also aworded by the Jury to Messrs. Gray and Davison, London, who have in vented a very ingenious and simple contrivance to com bine the great argan with the swell organ, by means of a pedal, which acts with the utmost case, and by which a very effective sforzando may be produced; thus en-larging the musical field of the performer, and adoing variety to the otherwise monotonous character of the most powerful and magnificent of all musical instruments,

Messrs. Gray and Davison's organ contains their newly-invented stop, the herostophon, first introduced by them in the organ at St. Paul's Church, Wilton Place It has also three manuals, and an independent pedal organ. There are—

and six composition pedals, Mr. J. C. Bisnop, London, and Mr. J. W. Walken, London, have exhibited but few specimens of their organ-bailding. Such makers have not been passed over by the Jury without Hosourable Mention, baving ever been in the foremost muk of organ-builders,

A Prize Medal has been awarded by the Jory to Jonan FRANZ SCHULZE, and Sons, Zollverein, for an organ which possesses two manuals, and an independent pedal organ, There ore-

Messrs. Schulzz's organ has blind prospect-pipes; the construction of the interior is therefore more simple. It requires no roller-boards, and is constructed with squares, which go in an oblique direction to the valves. In front, a vacant place for tuning is left, and the smotler stops may be placed in froot, to the great advantage of the

tone of the organ. 2ndly, It has a more powerful tone than others of lorger dimensions; it has also several soft stops—the whole being constructed after the theory of Professor

TOPFER. 3rdly. It takes up less room thou any other with the same number of stops, it weighs less, and requires less labour than organs of the same proportions.

4thly. It has elaims for its comparative cheapness,

considering that it as more power and depth of tone than is usual in organs of the same size. 5thly. The trumpet 8' is a free reed-stop, it is toned by series, the crutch is fixed, while the plate and the tongue are movable. The tone of this stop is more like that of a clariouet of bassoon, which has been attained

by a novel covering of the body of the pipes. 6thly. The posaune (trombone) 16', is also a free reed-

stop; it has a stronger tone, and speaks quicker than a mon reed-stop 7thly. Messrs. Schulze's organ has also a reserve bel-

lows, which assists materially the rapid speaking of the pipes, and which is of a peculiar importance, inasmuch as it provides a sure remedy for the unskilfulness of an organ-blower. A Prize Medal has also been awarded to-

Mesars. Decca, Florence, for a brantiful specimen of a chamber-organ, respecting which the following is an extract of the opinion of Signor Rossini:-

" Mesors. A. and M. Ducer, of Flarence, have built an organ of a diminutive size, possessing the same tone as one eight times larger. Its chief peculiarity is the

position of the lower notes, which are placed within the beach on which the player is scatted. These lower notes are placed in one single pipe, which gives the lowest C with 16 feet, and the successive tones of the chromatic scale hy means of eleven holes." To obtain the tone of a large organ, the builders, Messrs. Decct, have altered the form and disposition of the pipes, and invented a new species of mechanism. The instrument can be easily removed as it is, or it may be taken to pieces, packed up, and carried anywhere, just like a piano.
"The builders deserve great praise for this new instru-

ment, which not only does honour to their ingenuity, hat must expand the boundaries of art, particularly in the power it gives of uniting all the lower notes in one single pipe, which may thus lead to new mechanical improvements, and open sources of acoustic phenomena."

Honourable Mention has been made of an enharmonic

organ, invented by Lieut. Colonel T. Perroner Thomporgan, invented by Lieut. Colone 1. Princover 1 hourses, M.P., and huilt by T. J. F. Rosson, Loodon.
Mr. G. II. Holdfren has exhibited a small choir organ, the compass of which is from CC to F in alt. The stops are as follows: open dispason, as far as tenor C, 4 feet; stop diapason bass, curlestina, principal,

diaorton, The disseton stop has the effect of doubling every single stop throughout the instrument; the power, therefore, of the instrument is equivalent to one with twice the number of stops. This addition was invented by Mr. Holditch, who has applied it to church and chumber orcans. The contrivance is very simple, and not liable to derangement. The organ possesses a pnenmatic lever or valve, by which means the wind is made steady; also three composition pedals, with double actions to pull in and out the draw-stops. The pallets in the bellows are of peculiar structure, to prevent their casting or turning up from excess of heat or damp, which has been a great inconvenience in the formation of bellows

Pignofortes.

hitherto.

The following remarks upon pianofortes have been contributed by Mr. Thalberg :-

" Having been invited to contribute towards a Report on the pianoforte, I proceed to comply, in as short a space as is consistent with the nature of the subject. "It is necessary, in the first place, to notice the fact that music, though, perhaps, of all the fire arts, the first

in the order of cultivation in every country, has been certainly the very slowest in its development. In all its sister arts we look for the finest productions to the past, and in some cases to very remote periods of European and in bone cases to very remove periods of an opening civilization, while the great productions in music belong, as it were, to the present time, and are usurly all in-cluded in the last seventy or eighty years, certainly in the last century. For ages, even amongst the most cul-tivated and polished people, music was confined nimost wholly to melody; and its execution was bounded by the natural powers of the human voice, slightly and of kindred forms, such as virginals, spinettes, and harp-

considering that it has more power and depth of tone artistically cultivated; and to instruments, most of which were exceedingly imperfect. But the pleasure from music, even then, was derived from a complication of separate effects; from the quality of the tone, from intonation or variation in the degrees of gravity and neutetoushon or variation in the departure from and accur-uess, from modulation, or the departure from and return to the principal key, from rhythm, or divisions into equal groups, from the modes of expression—stacento and legato, forte aud piano, &c., and from the various movements appropriate to different feelings, from the solemn adagio to the merry presto. This complication of the elements of pleasure was increased by the employment of instruments in accompaniesent to soug, at first in nuison with the voice, which gradually led to connter-point, which in its turn immensely increased and varied the effects of music, caused the science to be far more studied, induced numerous experiments in musical acoustics, and gave a new and more elevated character to musical compositions. New instruments were invented, and old ones improved, accompaniments began to be composed to vary and heighten the effect of the melody, by using different figures of intonation, and orchestral effects were produced by appropriating different instru-ments to particular purposes. Then harmony, properly so called, began to be calityated, or the flow of different melodies in harmonic agreement. At length came the great masters, as Handel, Bach, Haydn, Mozart, Beethoven, &c., who gave an cutirely new, intellectual, and real artistic character to music, by employing in their com positions subjects appropriate to the character intended in the particular piece, and treating the different elements of musical pleasure in a methodical and artistic manner.

"These great composers thus elevated music to a level with its sister arts, and made the pleasure to be derived from it, like that from painting, complicated and refined requiring a certain education in the hearer, as in the observer, to be able to understand and appreciate its higher productions, so that we may now include music with the other fine arts, in so far that the uncultivated taste feels only this or that element of pleasure, while the cultivated taste appreciates all the elements employed, and reaps the full enjoyment of the most beautiful pro-

ductions of art. " In this progress of the art composers found all the aid they desired for the composition of melody in the and they desired for the composition of increase in the truth and flexibility of the voice and the violin; but for their orchestral and concerted pieces they could not keep in their studios bands of musicians. To meet this exigency they employed spinettes, clavichords, and harp-sichords, and afterwards pianofortes, which, though feeble instruments of no great compass, answered this purpose so well as to become universally adopted by composers. This use of this class of instruments led to the peculiar capabilities of the pinnoforte being thoroughly studied and appreciated; and the composers repaid their nbligation to the instrument by writing for it many of the very finest productions in music, and by practising the execution of these productions to such an extent as to be able to bring them before the public with the greatest color. The importance which the instrument had thus gained led from time to time to its improvement and enlargement, and this again to still finer com-positions being produced for it, and to the adaptation for the pianoforte of all the best orehestral compositions; so that the advance of the art, and the improvement of the piano, have had a mutual effect upon each other, until it is now beyond all question the first of musical instru-ments, both to the profession and to the cultivated classes

of society.
"More than three centuries back there were in use two kinds of small instruments with key-boards; the Clavitherium, of a sonnre shape, having strings of catgut, which were vibrated by hits of hard leather about a quarter of an inch long projecting from the side, and at the upper end of the jack, which was operated on imme-diately by the inner end of the key; and the Clavecin, of nearly the same form as the present grand plane, having strings, which were vibrated by plectrums of quill or hard leather. These limited iostruments, with others

sichords, continued in use, with very slight improvements, for two bundred years, until the beginning of the last century, when, in 1716, Marius presented to the Academy of Sciences, at Paris, a Claveein, whose strings were vibrated with hammers instead of plectroms. This was a very great step, wholly changing the quality and character of the tone of the instrument, and making it in reality a new and different one; in fact, the embryo Two years after, Christoforo, at Florence, intro duced some further improvements in the instrument, and produced what has generally been considered the first piano. But the new inventions, although immeasurably superior to their predecessors, had great difficulties to contend with, and were a half century in fighting their way into any considerable degree of favour. However, in 1760, Zumpe in England, and Silberman in Germany. had established small manufactories of the piano, and it was snecessfully competing with its more established rivals, as is sufficiently shown by its having been adopted and used by Haydu, who left sixty sonatas composed expressly for it. Gluck also adopted the piano; and we have seen the instrument on which he composed his Armida and other works, made for him by Johannes Pohlman in 1772. It is hnt 44 feet in length, and 2 feet in width, with a small square sounding-board at the end, the wire of the strings being little more than threads, and the hammers consisting of a few plies of leather over the end of a horizontal jack working on a hinge. The instrument, compared with a fine piano of the present day, is atterly insignificant and oseless; and it is difficult to conceive how it could have been used for the purposes it certainly served, till we reflect upon the importance to the composer of having at instant command any description of orchestral effect

to a demokratis after.

In France: In the following year Stelart partiest fall forms that the first piace of the following are Stelart partiest fall forms and, in 1740, firead revolution of the first partiest fall forms and, in 1740, firead revolution of cent a patent in retains to the piace. "In 1745, Gibb took one a patent for what is called but grandspaper action, which is still in not for quarter pairs, grandspaper action, which is still in not for equare pairs, in 1745 and 1715 and 1715 by Scothwelf. In 1849, Schwins Erral, to whose grains he planderer is a month indebted, to whose grains he planderer is a month indebted, extractly adopted. In 1849, Schwins Erral, varying the control of the

makers, have likewise contributed, in various degrees, at different times, to the progress of the instrument.

"During the first years of the matriancia.

"During the first years of this century two systems chiefly prevailed with regard to the grand piano, the older one followed by the Loudon makers, known as the English system, and the newer one in Germany, called the Vienna system. The difference was principally in the action, that of the English being the common grand action, the origin of which is unfortunately unknown; and that of Vienna a new action, invented, it is said, at Augsburg, by an organ-builder. The old grand action and man or vicinia a new action, invented, it is said, at Augsburg, by an organ-builder. The old grand action gave a more powerful blow and produced a fuller and finer tone, while the lightness of toneh of the Vienna action afforded far greater facilities of expression, and enused it, therefore, to be adopted by most of the cun-nent pinnists of the time. This is not at all to be wondered at, when we consider the immonse importance of the action of the piano, in bringing out the elements of expression which are peculiar to the instrument. Between the mind of the player that conceives, sad the string that expresses by its sound the conception, there is a double mechanical action; one belonging to the player in his fingers and wrists, the other to the piano in the parts which but the strings in motion. No two piano parts when put the strings in motion. No two pisno players touch the instrument alike—that is, no two players have the same mechanical action in their fingers, or pro-duce the same tones; and the difference in the style and degrees of excellence of pinnists is more owing to this than to any other cause. It is, therefore, self-evident, that that part of the piano which continues the action of the flogers, and completes the connexion between the mind of the player and the strings of the instru-ment, should have a delieacy and a power answering as near as possible to those of the hand of the player. Every difference in the action of the piano will give a corresponding difference in tone and expression; and hence this part of the instrument has at all times been justly considered of paramount importance, not only by the great professional piaoists but by the highly-cultivated amateur player. Now, however, we have an action, the invention of the late Sebastian Erard, which gives a more powerful blow than the old grand action, and a far more rapid and delicate effect than the old Vienna action—thus combining the advantages of both systems. " To give an idea of the degree of perfection attained

at the present day in the construction of the piano, we will describe one of the grand pianos in the Exhibition.* This instrument is 8½ feet in length, and 4½ feet in its greatest width; its frame is of enormous strength, com-pared with the instruments of former times, being heavily braced with wood below the strings, having a complete system of metallic bracing above the strings, firmly abutted, and consisting of longitudinal bars let into metal at each end, and having the corved side formed of a number of separate pieces glued together in a mould to insure durability and fixedness of form. Its soundingboard extends to the frame on all sides, except the space left for the action. The strings are made entirely of steel, and of wire so thick that the teusion necessary to bring them to the proper pitch produces an aggregate strain equal to at least twelve tous weight, while they are passed through studs drilled into the metal-wrest plank, thus giving the strings an upbearing position, which prevents the slightest displacement of the point of contact by any force of the hammer; and the system of placing the strings on the instrument, determined by accurate acoustic experiments, causes then to be struck by the hammer at that precise nodical point which produces the freest and elearest tome. The compass is ex-tended to seven octaves from A to A. The action of this tended to seven octave from A to A. The action of this piano is described by Dr. Lardner, in a work just pub-lahed on mechanics, as 'a beautiful example of complex leverage in the mechanism which connects the key and hammer. In this instrument the object is to convey, hammer. In this instrument the object is to convey, from the point where the finger acts upon the key to that at which the hammer acts upon the string, all the delicacy of action of the finger; so that the piano may participate, to a certain extect, in that remibility of touch which is

^{*} And yet for that very purpose they continue to be used by many celebrated makers up to the present time.—

^{*} Mr. Erard's, in the British Department.

observable in the harp, and which is the conrequence of observance in one marp, and the string in that instrument without the intervention of any other mechanism.'
The power of this instrument depending on the quantity of matter brought into vibration, the resonance, or the perfection of that vibration, depending on the correct proportions of its parts, and the accuracy of intention depending on the nature of the bridging, the proportions of the strings, and their arrangement with regard to the blow of the lammer, are all most admirable; while the action depending on the peculiar mechanism employed far surpasses everything cise of the kind, for it exables the player to communicate to the strings all that the finest-formed and most skilful hand can express, and becomes, as it were, a part of himself, reflecting every slade of his feelings, from the most powerful to the softest and most delicate sounds. This netion is, indeed, so perfect, particularly in its power of delicate repetition, that if any note is missed in execution upon it, it is the fault of the player and not of the instrument. Many persons have a very meagre notion of the power of expression possessed by the pianoforte. The fact is, however, that it really esesses almost all those elements of expression which possesses almost all those evenues of the belong to my other instrument, and several which are peculiar to itself, from the circumstance of the various person of music adapted to the instrument being brought out by the same hand and same feeling. An immense difference of volume of tone and of effect is produced by the manuer of touching the keys and by the use of the pedals, especially upon an instrument of great power, fine quality of tone, and delicate nechanism in the action. "The manufacture of the pinn as a branch of trade is of very great importance, from the superior character

of very great layer trace, from the repetite of instead of the principal very designation, and the value of the principal very designation, and the value of the principal very designation of the principal very layer to the principal very layer of the principal very layer of the principal very layer of the smaller of the principal very year more designation of the principal very year more other mutual instruments. This is corroborted by the first that more years paintenferture constituted whereas now it fills more than three-paintens of the first thin of the principal very layer performance of the principal very layer very layer of the principal very layer
"The social importance of the pisson is beyond all presents for greater than that of any other instruments of of society, as civilization advances, is with reper to the changes of a society, as civilization advances, is with reper to the changes of at some security. Formerly, and yall such which the contract of the source changes of the contract of the contract of the contract of portion of society, the greater and the contract of the contrac

piano.

"In many parts of Europe this instrument is the greatest solace of the studious and solitary. Even steam and sailing-reserved for passagers and long voyages are now obliged, by the fixed habits of society, to be furnished with pianoforter, thus transferring to the occan itself something of the character of home cajoyments.

"By the use of the piano many who never with the

"By the use of the pusso masy who never visit the opera or concerts become thoroughly acquisited with the choicest dramatic and orchestral compositions: this influence of the pisson is not confined to them, but extends to all classes; and while considerable towas have often so orchestras, families possess the best possible substitute,

making them familiar with the finest compositions. The study of such compositions, and the application necessary for their proper execution, may be, and ought to be, made the means of greatly improving the general educational habits and fastes of pinns othedrats, and that secreting an elevating influence, in addition to that refined and elegant pleasure which it directly dispenses. **

One hundred and seventy-eight instruments of this class have been exhibited, Great Britain contributing sixty-six of that number, according to the following Tuble:—

In the above department the three great European mider, Merris, Danzerow C, Catanja, and Eanan, midra, Marsen B, Marsen C, Catanja, and Eanan, find manufacture. And spon the subject of this highly-invariant and valuable instrument it in necessary to account of the properties of the

Mesers. Longman and Co., of Loudon, predecessors of Clementi and Collard, first introduced what is called the "hopper escapement." The invention of the damper, for clicching the vibration of the strings, was due to a nativo of Ireland, and it was for a long time called the "Irish" damper.

About the year 1776, Pecker, 8 German, undertook to apply the planofere mechanism to the harpsteloved. In apply the planofere mechanism to the harpsteloved. In Stolats, at that time worksnee in the employ of Barklandi Tachold, of Gerat Paltenes Street, London. After many reprintents, the gread planoforte mechanism was the properties of the properties of the properties of the many tension estill used by Westra. Broadwood and Mestra. Stodart, and is re-markable for its simplicity, effited direct action, in the properties of the properties of the direct action.

Messrs. Broadwood alone, from 1780 to 1851, have made with this mechanism (slightly modified from time to time) upwards of eighteen thousand full-sized grand planofortes, besides fifteen hundred pianofortes of small

amensous.

The earliest notice of a pianoforte in their books occurs in 1771—of a grand pianoforte in 1781. Clementi was the first to bring the grand pianoforte into notice as an effective concert instrument. He played on one by Broad-

the control intrinsical. He purpers on 68 by Breeder.

The third many of pinned for all kinds under by Meast. Breedered from 10 km server
^{*} End of Mr. Theiberg's remarks upon pinaofortes.
† This award was only confirmed by the Council of Chairmen in Mr. Erard's case.

red and seventy-three. Besides these there are rous persons working at home for the same firm, hundred and seventy-three.

It is clear that for many years the pianoforte was inferior to the harpsichord; for when, in 1765, Burk-hardt Tschudi presented an instrument to the King of Prussia, it was a harpsichord with two rows of ke Prussia, it was a harpsicherd with two rows of keys, This instrument is still at Potsdam. The strings of the harpsichord being very this, the wooden framing of the case sufficed to bear the tension. As soon as the strings of the pianoforte were increased in thickness it because necessary to strengthen the cases, and stell arches, therefore, were introduced between the strings. So carly as 1808, Mesers. Broadwood applied horizontal steel bars over the strings. The number of these bars varied from two to seven.

Messrs. Stodart, in 1820, patented a system of bracing by means of hollow metal tension burs applied over the strongs, combined with a suspension bar over the wrest-plank, In 1824, Mr. Erard patented a somewhat different system of horizontal metal bracing.

In 1827, Messrs. Broadwood patented a third system of metal bracing for the grand pianoforte. It was a combination of the metal bars already adopted by them, with the metal string-plate which had by them been first applied to the square pinnoforte in 1822. The four pinno-fortes which have been exhibited by this firm, may be described, as to externals, as follows:-

described, as to externals, as follows:—

1. A grand pianoforte in the Nore, shony case richly carved and gilt; the top, chony inlaid with natin-wood; above each of the three legs is a medallice, carved and gilt, having busts of Handel, Mozart, and Becthovon, The design by E. M. Barry, Esq. 2. A grand pianoforte in Amboyna-wood case, with carving. 3. A grand pianoforte forte in plain Ambeyna-wood, 4. A grand pianoforte in Italian walnut-wood case.

Of these four seven-ectaves, C to G, grand pianofortes, two have each three straight teusion-hars parallel to an over the strings. Of the other two, one has one parallel bar and one long oblique bar: the other has one parallel bar and two oblique bars. The scale of this latter instru-ment may be considered as a triangle of nnequal sides, This individed by these three bars into four triangles. This in-strument is the most sonorous of the four. In all the four planofortes any bending of the wrest-planks is ob-viated by the application of a metal transverse suspension bar, placed over and nearly in a line with the studs. The peculiar application of this suspension-bar is considered as an essential improvement. The tension-bars are also new, and entirely peculiar to these instruments, being constructed with flanges on each side to prevent twisting. constructed with images on each sade to prevent twisting.

A section of these bars transversely would present the figure of a cross +. The strain of the strings on these instruments is immense, notwithstanding which they stand in tone far better than those constructed with the ordinary bracing. In the four pianofortes exhibited, the following improvements are illustrated, and are claimed by Messrs, Broadwood as being entirely their own :-

1st. A newly-revised harmonic scale of strings. 2nd. A peculiar method of fixing the sounding-board. 3rd, The transverse metal suspension-bar. (It supports the wrest-plank, enabling the maker to dispense with se-veral direct tension-bars, which are just so many impediments to free vibration.)

4th. The construction of the tension-bars. These are

constructed in such a manner as to combine the maximum of strenoth with the minimum of weight. 5th. The fixing these tension-bars in the string-plate by means of wedges, thus insuring equal tension.

6th, The diagonal tension-bars. These abut against

They meet effectually what is commonly termed the string-swag" of the string-plate, and they enable the maker to do with a single direct tension-bar, The whole of the above-named six povelties of inven-

tion are dated by Messrs. Brondwood in the year 1847. It is by the combination of most of the improvements ast mentioned that this firm has attained, in their pianofortes, not only more sonorous tones, but a greater perfection of the quality of tone. Again, there can be no doubt but that simplification of bracing, in the construction of improvements are illustrated :--

pianofortes, will eventually enable the public to obtain first-rate instruments at a comparatively moderate price, And it is proper to record that, up to this time, the aim of most makers has been to introduce as much iron or other metal bracing as safety to the quality of tone would bear, and that Messrs. Broadwood are now the first to retrace such steps, learning from experience that tension-bars are but make-shifts, and that it is probable that the best mode of constructing a pianoforte would be to strengthen the case by other means, superseding the tension-bars alto-

It should also be noticed that the action used by Messrs, Broadwood in their pianofortes is of the most simple and effective kind, and that its very simplicity is a guarantee for its durability,
Mr. P. Erano has exhibited a variety of pianofortes in

the British and French Departments. In these pianoforte considerable improvements have been made with regard to the mechanical part of the action, which has become one of the most perfect existing, -- answering the properties of the most intricate manual dexterity of the performers of modern times. This maker combines with his imor modern times. I also maker communes with as im-proved mechanical action a peculiar structure of the bedy of the pianoforte, by which a highly-successful result is attnined. Various patented improvements in the mechanism, &c.

of pianofortes, are displayed in the instruments exhibited by Mr. Erard, of which the following is a description:—

BRITISH DEPARTMENT,-1. Extra grand pianoforte, in walnut-wood, with carvings gilt; seven octaves, A to A; waland-wood, with carvings gilt, seven octaves, Ao with Ernard's penter repetition netion [1821]; pattent apbearing (1809); complete system of metallic brain bearing (1809); complete system of metallic brain in remarks—2. Extra grand piano, with new patent metal west-plank (1809)—4. A short grand, six and three-quarters octaves, new scale, C to A; in a rose-wood such authority with authors—5. Extra grand walout, oblique, with carvines in the Elizabethan style; seven octsves, A to A; threed with four metallic bars (1850). Action patented (1840).—6. The same, in ebony, inlaid with silver (repetition action); also braced with four metallic bars (1850). - 7. Satin-wood; six and three-quarters; oblique. Patent of 1840,-8. A new patent frame, with new screws, tuning apparatus for apright pianofortes; the same having been specified in the patent for horizontal pinnofortes

FRENCH DIFFREMENT,—1. Extra grand pianeforte, in tulip-weed care, inluid with silver lands, tortoiseshell, and brass, elaborately engraved, supported by six caryatides, in the most rich and elegant style; seven octaves, A to A. Patents of 1869, 1821, 1825, and 1850.— 2. Extra grand pianoforte in rosewood, with or-molu ornaments; seven octaves, A to A .- 3. Short, or semi-grand, with repetition action (1809); six and three-quarters octaves, C to A .- 4. Grand square pianoforte, of a new form, with repetition action (1821), metal bracing (1825), upward bearing (1809), on the principle of Franc's grand; six and three-quarters octaves, C to A. - 5. Grand oblique of seven octaves, braced with four metallic bars. Patents ol 1840 and 1850.-6. Oblique rosewood, with or-mola mouldings; six and three-quarters octaves, C to A. Pateut of 1840,

Messre. Colland and Colland have exhibited several pianofortes, of which the following is a description:—

1. A grand pianoforte, in a case of British mottled cak, seven octaves, A to A .- 2, A grand planoforte in resewood with carved and gilt ornaments, in the style of Louis XV case, with curved cabriole truss supporters; seven cotaves, A to A.-5. A square semi-grand pianoforte, in walnut-wood; six and three-quarters octaves.-4. A grand esbinet pianoforte, in a case of British oak, of novel design; six and three-quarters octaves .- 5. Two microdesign; six and turce-quarters occur, in pine and resc-chardons, or semi-cottage pinnofortes, in pine and rescwood eners; six and three-quarters octaves. Exhibited as speciment of superior instruments of their class, at very low prices,

In the above-named instruments the following patented

1. In the mode of stringing pinnofortes, by passing the wire round a single pin, in all classes of pinnofortes, thus superseding the use of the note or eye, before in preeral use. Patent of 1827. This mode of stringing has become almost universal since the expiration of the patent. 2. Applying a check to tha under-hammer, to prevent the rebound of the hammer against the string. Patent of

3. A new construction of the action in horizontal grand and square pianofortes, the escapement being placed upon the key, and coming into coulact with a lever or erank, and thus regulating the rise and fall of the hammer.

Patent of 1835,

4. The introduction of a new class of square pianoforte, entitled "the square semi-grand pianoforte; in which a closer approximation to the precularities of the horizontal grand passofirte was attained. Patent of 1836.
5. The introduction of the traversing exagement fixed upon the hammer-rail, thereby admitting of a firmer blow and greater resistance, as also the introduction of a repeating the properties of the

and graver resonants, as and the introduction to relate the international control of the repetition movement to square and to vertical, on upright planeforter. Platest of 1s43, 7. A new design for the shape of a square planeforter, entitled "the Symmetrical Grand Square," by which greater beauty of form was secured, the key-board being placed in the centre of the instrument. Rejatered in

Several other makers of the pianoforte have contributed to the success of the musical department of the Exhibition, to whom the Jury have awarded the Prize Medal: their names will appear in the Award List.

U.....

Mr. P. Enand has exhibited cleven harps in the British Department, and two in the French Department.

In the manufacture of harps acceral highly-successful and important improvements have been made by this house, particularly in the invention of the double-artiso harp; and thare cannot be a doubt that, from the perfection of their mechanism and the excellent quality of their tone, their harps are unsurpassed by any other maker. In awarding the Council Medal to Mr. P. Erard, with

reference to his pianofortes, the Jury took into consideration the great merits of his harps, and have, therefore, included them in that award.

In this class of instruments Honourable Mention has been made of Messrs. B. Jones, for an improved triplestrung Welsh harp, United Kingdom; and Domeny (France).

A beautiful and very ingenious specimen of the horp guitar (called a "guittarra harpa") has also been exhibited, and for which the Jury have awarded a Prize Medal to the inventor. J. Gallagos (Scain).

Bow Instruments.

In this department the Jury have awarded the Council Medal to Moss. J. B. VULLAUME, of Paris, for the excellence of his violins and other how instruments, and for

his invention of the Octo-Basse.

M. Volliame is estitled to pre-emisent rush among these student matter with a law user of lots one-motion manufacturer who have user of lots one-motion manufacturer who have used to be submitted to the control of the lot of lot of the lot of

Brass Instruments.

The following remarks have been contributed by a uror:—
"Among the musical instruments exhibited in the Ex-

"Among the musical instruments exhibited in the Exhibition, the number of brass instruments, 'instruments de cuivre,' is considerable.

"England, France, and the German States are the countries which have contributed largely and nearly exclusively; whilst America, Hamburgh, Canada, Deumark, and even Russia, swelling the list of instruments with fixed tones, such as panosfortes and organs—or instruments of wood, such as flates and clariouers, &c.,—do not appear as manufacturers of brass instruments.

As in all other instruments of music insuchine special design justices with a state of the insulation of our terms that of our design justices are within at a state of the st

"That instructors of this class night, in the capt, age of the world, have been many prefet than other several property and the property of the large to an excustical perpose, the use and power of the large to an excustical perpose, the use and power of the large to an exchange the property was not required the construction of the lates, name having endowed them with a power or the lates, name having endowed them with a power or ever lakely to equal, the thought is machine composed of viscal instruments or plan, such as organs, the property of the proper half of applicant arrequire, it, machinetics of one, readering the organ and its inlustrate, in spite of the corresponds of the subsection of machine to the property of property of the property of prop

born, Movra by the *human lamps,* and capable of piving expression to music; and to induce even the multitude to listen to the organ (who, perbags, respect it from its entry association with our religious services, and the effect of the property of the p

"The modern makers of wind-instruments having the sin-blast 'as a counting body, and the mechanism for setting upon it perfect, have turned their attention to the improvement of the wind-course as the 'regulating medium,' particularly in valved instruments: they have redeavoured to aveid the angles caused in the tube by and quality of the 'sounding mass' bas also occupied their ratenties.

" As the examples are few of sound produced by undulation of air without resonance (perhaps one is thunder, which may be called a purely serial sound, but which sets in metion a greater bulk of air than all the machines for producing sound in the world put together), and acknowledging that the resonant mass is a distinguishable feature in musical instruments; so, taking the wellknown instrument, the pianoforte, as an example, and regarding the use of the sounding-board as 'resenant mass' in that instrument, we shall be able to judge, by analogy, how justly the attention of wind-instrument makers has been turned to the resonant mass, case, or makers has been turned to the resonant source, value, or sounding-board, of their instruments. The effect of a string set into vibration by the sounding body in the 'framework' of a pianoferte is not appreciable, although its vibrations are within the prescribed limits; but when set vibrating in connection with the sounding-board, or 'resonant mass,' it brings the whole into resonance, completely controlled by the 'regulating medium, string), and the result is a voluntinous expansion of the tone. The greater the resonant power of the soundingboard, the greater is the expansion of the tone. So with wind instruments, the greater the resonant power of the material of which the instrument is made, the more powerful is its volume of tone; but no indistinctuess is produced on these instruments, by carrying this expansion of sound to its greatest attainable point, from the character of the regulating medium, and the comparative slowness with which notes are required to be produced. But, in the pianoforte, if this expansion of sound is carried too

for, much indistinctness in the result.

"The use of metal as the 'resonant mass' of all wind instruments, beides those issually known as hrast instruments, be locationing very general; thus we have the flute, par excellence, of Mr. Boohm: the claritonet, par serellence, of Mr. Bask; and the bassoon, par excellence, of Mr. Bask; and the bassoon, par excellence, of Mr. Sas, the control of Mr. Sas, made of metal.)

"Brass is the material which is most generally preferred for wind instruments, though to the fancy of an American exhibitor we are indebted for a flute made of 'galvanized India-rubber.'
"On hearing and examining this class of musical in-

"releasing said extinsting this case or insistent inordinate of the construction with those possessing the improvement of construction with those possessing the improvement effected of late years, both in their acountied proportions and in their mechanism, the superiority of tone and facility of performing on these (namy of them unwieldy) instruments is very utriking. This fiellity is acquired by instruments is very utriking. This fiellity is acquired to increase the construction of the construction of the contraction of the construction of the conments, snabling the performer of moderate ability to produce on his instrument every note of the 'gamust' or 'stacle' with the greatest registry; if not as pure in term and virtuatery as the harmonic notes, yet with such justices of interest of the product of the virtual of the product of the virtual of the product of the virtual of the Second Life Gards.

"Meas. Periner, a native of France, seems to deserve the credit, amongst the intrument-maker, of having about twelve years ago, first materially improved the construction or viavel instruments; and the English and French exhibitors have been very secessful in carrying these improvements will further: thus the equitrilization values invested by Mr. Osten, a surgeon of Lichthield, above the improvements which has effected in the above the improvement which has effected in the above the improvement which has effected in the namerous among the wind-courte by the section to the piace.

of the passion.

"The instruments exhibited by Mr. Kormiza, of Mericia Sirvet, Covent Garden, made on the plan in-vented by Mr. Shaw, of Nottingham, called the 'patent beautiful and the states, are of a decidedly superior character: and the states, are of a decidedly superior character: and the states, are of a decidedly superior character: and the states of the s

conrse in valved instruments is highly successful.

"The instruments of Mr. Pask, 141 Straud, are all of the first order; they have great sonerousness, power, and facility of execution.

"Those by the French exhibitors, viz., by Mesrs, Art. Cotarous, Bossos, Ato. Cotarous, and Gattmer, and those by Mattituos, of Belgium, possess in every respect the qualities which in these instruments are required, some having greater falsees of tene than others, but all are constructed on the best-known necessities, the principles, of very superior manufacture and finished

"The instruments exhibited by M. Sax, of Paris, show great advancement, for not only do many of them, nother French-horns, trumpers, and trombone posses additional power, adaptones, and imposite essens obtained in a that it is not the quality of the metal brought into whether that it is not the quality of the metal brought into whether when the parish of the metal brought into whether quality of the tone produces, and that succeedal results among of them, vix., the so-called "Sax-bones" posses a quality and richness of tree unheard until the introduction of the second of the produce of the contraction of the second of the produce of the "Te-instruments exhibited by the German manufact."

"The instruments exhibited by the German manufacturers, though not so perfect as those of the French and English manufacturers, have some excellent qualities; and the euphonic horn, invented by Herr Sommer, is an instrument of great power, as well as awetiness of tone.

"Two ingenious contrivances for changing the keys of brass instruments without the use of crooks, are exhibited by M. Gatzmor, of Piris, and Mr. J. Catcorr, of London, the former making use of a serew, the other a radius-tube, for lengthening or shortening the windcourse of the instrument.

"Judging from the number of makers, it may be

supposed that the demand for this class of instruments are considerable. There are inpurated of this epichelion of a considerable of the are inpurated to this epichelion of the considerable of the constraints of the constraints of battle by M. Sax, assents to sortly fifty. It is well while command is new classified over these instruments, while consequent on the better form of the enterwise, and their present comparative chapman. But it is in the conceptor in the better form of the instrument, and their present comparative chapman. But it is in an eligibility of their brane internations are equal to particular their present comparative chapman. But it is an eligibility of their brane internations are equal to patch, but they must be longel at a price aften flay price, their their batter of the Present Consent of their price of their their batter of the Present of their con-

[•] That the Crystal Palace was very unfavourable to the effect of aven the largest organs axialisted, does not admit of a doubt; but I cannot agree with the contributer's remarks on organs in general, nor do I believe that it was "found necessary" to employ either a "San or esphesial organs in the Exhibition. Due to listen to my one of the organs in the Exhibition of the baseon exhibited by Mr. San & The Investigation of the baseon exhibited by Mr. San &

WIND INSTRUMENTS. - WOOD AND METAL.

For Orchestras and Military Bonds. In this department the Jury awarded the Council Medal to-

M. Addlerie Sax (Paris), for his invention of several new classes of wind-instruments, in wood and metal; and to T. Berna (Munich), for his important scientific improvements of the flate, and the successful application of his principles to other wind instruments.

his principles to other wind instruments.

The following remarks have been contributed by a Juror:

"Among the inventors of musical instruments, the

highest disclorers in the rith mention of M. ARCHITE SAN, which recoinded with regard in the variety, receivers, or the utility of his inventions. His creation of her entire of the en

"M. Yaz has also evasted the class of Saxophones, brass instruments with a simple reed, similar to the elarionet. The effect of these new instruments poissesses a charm equal to the originality of their tone, and they carry the highest degree of perfection 'A nour expressive de

Perchester."
"It must be conceded, that his boss and double-bass clarioness, in wood and metal, are inventions of inestinable value. Besides there, the has selded a semitone that lower register of the ordinary clarioness, and by a new key, has rendered it possible for the performer to

the the upper notes it ones with the greatest tase.

"M, Sax hashes contrived foll lips per policity could be seen to be

"Lastly, M. Sax has adapted to the hugle-horns of infautry bands a set of portable tubes, which, on heing adjusted to simple hugles, transforms them into eyillader bugles of various keys; thereby chaoging the monotonous character of the simple hugle, by giving it the means of producing all the intervals of the musical scale.

M. Bourt's incretions may be described in follows:
— Furity, has he would the constraint proportions of

It is proper to notice, that among the bruss instruments exhibited by Mr. Kohler, was an improved Chromatic Trumpet, invented by Mr. T. Harrza, sen., and which has been acknowledged by competent judges to be the best instrument of its kind.

• It has been already stated that the invention of the bassoon exhibited by M. Sax, is claimed by Mr. Cornellus Ward, of London.—Reporter.

It doubt also be mentioned, that serveral improvements are illustrated in Mr. J. CLYENGY Flutte, childred J. Mr. II. POTTAR, in which the facilities of other modern fluttes, and the enlimary system of facilities of extense modern, and their defective parts avoided. In this instrument the tone and most arredered equal by the same means are redered equal by the same means and additioned in the holes. It has likewise chilms to consideration for comparative elsepasses, the mechanism being so simple, that its price does not exceed that of the old eight-keyed flutte.

The Jury have awarded the Prize Medal to various makers of wind instruments whose names will appear in the Award List.

Harmoniums, &c.

In the class of musical instruments, including Melodiums, Seraphiaes, Panorgues, Afolians, &c., Messra, Wheatertook and Ca., of London, have exhibited a very ingenious and effective one, called the Portable Harmonium, of which the following is a description.

It has a compass of five octaves, commencing from the lowest C on the violoncello, the key-board being on the same extent and scale as the larger harmoniums. It can be instantaceously folded up, so as to occupy less than half its height, and half its length.

This hartrament is quite original in nearly all its mechanical parts. It is peculiarly constructed for producing expression, and may either be used by itself for monument of the producing expression, and may either be used by itself for monum, or for taking vision, fluid, or violocatello select or parts—its capabilities of expression giving it great softwateges in ministrupt terms carriers. It may be catallage the perference to give a hand to each instrument, and by this means to produce a rariery of effects. The Jury have awarded the Prize Medal to Mesers. The Jury have awarded the Prize Medal to Mesers.

Honourable Mention has been made of MM. Alexandra and Son, France, for two "Hormonisms is Percession," A. Müller, France, for twn portable Melodiums; and J. Deutschmann, Austria, for n Sera-

In this class may also be placed a rowl kind of musical bartament, called the Harmonia-childred by the instrument and instrument, called the Harmonia-childred by the vertex, M. De YLLERON. This little instrument is about the properties of the properties of the Harmonia control of the control of the catter, and the control of the contr

Instruments of Percussion. In this deportment, comprising Drums, Cymbals, &c.,

the Jury More noticed a writing of improvements of considerable importance, in the mechanism for tuning drams, for orehestras sud military bands. For these improvements Prize Media have been granted to Mesers. C. Want (recluded in the award to him for a baseous, United Kingdom; A. Ksovar, Coliverein, And Illotuted Kingdom; A. Ksovar, Coliverein, And Illotuted Ningdom; A. Ksovar, Coliverein, And Illotuded Ningdom; A. Ksovar, Coliverein, And Illotuded Ningdom; A. Ksovar, Coliverein, And Illotation of four very large and fine Gongs, exhibited by Tux Illocotranage Earl Four, Coura-Coura-

Automatic Instruments.

In this class, comprising Mechanical Organs, &c., Mr. Bayerson, of London, has exhibited a Barrel-Organ, for which the Jury have awarded a Prize Medal.

Other ingenious instruments of a similar description have been exhibited; and Honourable Mention has been made of Mr. C. Dawson (for a harrel-organ, called an Astophon, the tunes of which are preduced by means of perforated sheets of mill-bened), Measrs. Grax and Davison (for a barrel-organ), Messrs. Waimlas and

STRUERY, LORDON (for a self-seting organ, manufactured wood and felt for musical instruments, &c. The Jury by F. Wehratt, Black Forcat, Busken), United Kingdom, have made Honomrable Meution of Meisra, J. Door made to the control of
Americaneses articus ne consectua una automat tentrementa.

In this class are included tuning-forks, tuning-lummers, pitch-pipes, wire-strings, violia, viola, and violoderilo bors, roins for bors, nuntied diagrams for various
groups, exists for bors, nuntied diagrams for various
groupses, ministers models, neutronous, specimess of deads—then, hay and guitar strings, Venice.

H. R. BISHOP, REPORTER.

CLASS XB.

REPORT ON HOROLOGICAL INSTRUMENTS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

E. B. DENISON, M.A., Chairman and Reporter, 42 Queen Anne Street. (Juror Class X.) Baron Armand Siguelen, Deputy Chairman, France. (Juror Class X.) Professor Daviel Colladon. Switzerland. (Juror Class X.) E. J. LAWRENCE, M.A., 44 Chancery Lane.

THE matine ehronometer may be considered the most (No. 342, p. 1070); the last of whom has exhibited a important of all machines for measuring time; and it is chronometer in which the necessity for a fusee is superalso the one in which an invariable rate of going is of the most consequence, masmuch as longitude at sen is determined by means of chronometers, and they have frequently to go for a longer time without the means of being corrected by astronomical observations, than astronomical clocks, which are generally accompanied by fixed transit instruments.

It will probably appear strange that we have not awarded any Council Medal for chronometers, of which there are a considerable number in the Exhibition, especially in the English part, some of them by makers of the highest reputation. It is, however, this very cir-cumstance which has rendered it impossible to make any such award; not only because we are directed by the Royal Commissioners to avoid the attempt to distinguish one article from others of the same kind, merely on secount of superiority of execution, but because, among several of the best makers, there really is no one who could properly he so distinguished above all the rest.

The principles of the construction of ehronometers have now been settled for some years without any material variation, except in one point, which will be mentioned presently, and there is hardly any visible difference between one good chronometer and another; it was hence ohvionsly out of our power to make such actual trial of them as can only be conducted in an observatory, and must be continued for a considerable time in order to

ascertain their relative merits. We therefore came to the conclusion that the only satisfactory plan on which we can distinguish any among the large number of chronometers in the Exhibition (at least in the English part of it), is to adopt the results of the trials at the Royal Observatory, during the last few years, of elironometers by the same makers as have now seet any to the Exhibition. But it must be understood that the same reports of the Greenwich trials which justify us in awarding prizes to several chronometer makers who are exhibitors, show that others who are not exhibitors would have been equally entitled to Medals if they had sent any chronometers here. The exhibitors who have been awarded Prize Medals from having obwho nave been awarded Frize Stedails from having ob-tained high places in the trials at the Royal Observatory in the last few years are—Messrs, Dzs.r (No. 55, p. 413). C. FRODERIM (No. 57, pp. 414, 415), PARKINSON and FRODERIM (No. 35, p. 411), HUTTON (No. 7, p. 407), and LOSZEN (No. 12, p. 408); and we should have been glad to have the opportunity of similarly acknowledging the merits of Messrs. Poole, E. J. Masser, and Errer, as the makers of chronometers, which, together with those of Loseby and Dent, have exclusively occupied the first

seded by a remonitor escapement of a more is super-servation than usual, the impulse being given to the balance, not by any teeth of a scape-wheel, but by a small spring which is wound up sufficiently for the pur-

The single point in which there is any material difference in the construction of the best chronometers, is the mode of effecting what is called the secondary or auxiliary compensation of the balauce, or that which is required in addition to the ordinary compensation, to prevent the chronometer from gaining at mean tem-peratures if it is adjusted for two extreme ones, such as 20° and 164°, or losing at the extremes of heat and cold if the compensation is adjusted only for

temperatures within moderate limits, as from 40° to 80° temperatures within modernic limits, as from 40° to 80°. The carliest inventions for this purpose, as well as the discovery of the necessity for a secondary compensation, aquear to have been made by Mr. Elfe and Mr. Deat about the same time, and independently of each other; and their nothods are still in use, and evidently very second the same time. cessful. But we agree with the opinion expressed by the Astronomer Royal in a report made by him to the Admiralty, that the most inequious contrivance for this purpose, and probably the best adapted to the wants of chronometers—at least of those which are likely to be exposed to extreme temperatures - is Mr. Loekby's (p. 408), in which small curved thermometer tubes are set upon the ends of the ordinary compensation bars, so that the increury advances along the tubes towards the centre the increary auvances along her tures towards the centre of the balance, and at an increasing rate the nearer it approaches the centre. The effect of this, as of most of the other contrivances for the same purpose, is evidently to diminish the moment of inertia of the balance still more than it is diminished by the bending inwards of the ordinary compensation bars, on the ends of which the mercurial tubes are fixed,

The three makers who have been mentioned in addition to those who have received Medals not being exhibitors, we can give no account of their methods of compensation, Mr. DENT'S (p. 413) consists in placing the balance weights on small additional compensation bars set on the ends of the common ones, in such a position that the weights advance and recede in a radial direction more rapidly the nearer they are to the centre, for any given number of degrees of heat. There is also a chronometer exhibited by Messrs. Barraup and Lunn (No. 34, p. 411), with a contrivance which is substantially the same in principle, and perhaps equally likely to answer, though not so simple in form; besides others which do not appear to us to require particular notice.

of Looky and Look, now extractively occupient to series, port for un to require particular dotter.

Among the ferrigar chromometer which we have had judge in the ferrigar chromometer which we have had judge the control of the competence of the highest reputation in the respective only requires about one-certage, exhibited by Mr. Doss, the surface of the highest reputation and their respective of the control of the compensation of a Mr. Usana Zionescuss, of Altona (No. 17, p. 150%, and here farminghed with a copy of the Observatory report of the Lorent Recentary of Nordchild (C. L., Zolferente). In our of a decounter with this landers end upting,

and the small amount of compensating materials which it requires; and the variation of rate during the five months it was tried was very small. It is necessary to add, however, that Mr. Dent told us that some difficulties in making these glass springs have hitherto prevented their being generally used, aven by himself; and we mention these facts in the hope that he and other persons may be thereby induced to exert their ingenuity in overcoming these difficulties, so as to bring into use a material for springs which requires so little compensation, and consequently no secondary compensation, and which is also free from liability to rust, a point of manifest importance in instruments to be used at seu.

Astronomical Clocks.

Among these clocks, which are also sometimes called egulators, there is little that requires special notice. There are several of the usual construction, with Graham's escapement and mercurial pendulum, by the emiment makers who have already been noticed, as well as hy some others, both English and foreign. But astronomical clocks which will go accurately within two or three seconds a week may now be had of all good clockmakers; and it would be absurd to give a prize to any one for sending an instrument here, which a hundred other persons could have sent if they pleased; except in a few cases, such as that of chronometers above mentioned, where the exhibition of an article, not in itself distinguishable from others of the same kind, has enabled

ns to make a proper acknowledgment of the well-esta-blished reputation of the maker, *

Besides these astronomical clocks of the usual con-struction, there are several with new escapements, chiefly on the remontoire principle, but none that appear to us likely to supersede the old dead escapement. We have nevertheless given Prize Medals to Mr. Gowland. of London (No. 27, p. 410), and M. GANNERY, of Paris (No. 516, p. 1203) for gravity escapements, which are substantially the same; the impulse being given in both of them, not by arms turning on pivots, but by small weights, which in M. Gannery's clock are bung by threads to the pallet arms, but in Mr. Guwland's are still more independent, being small inverted cups resting on the pallet arms, and alternately taken up by spikes projecting apwards from another pair of arms attached to the pendulum: on the other hand, in M. Gannery's escapement there is less tendency to trip; and it ought to be known to the inventors of remontoire escapements, that independently of the risk of actual tripping (or letting two or three teeth slip past at once), any tendency to drive the pallets too far, if the force of the clock happens to increase, is fatal to the accurate performance of such an escapement

It should be added, that Mr. Gowland claims as an advantage of his escapement (and M. Gannery may do the asme, and so may M. Wagner for one of his turret-clocks, which will be noticed afterwards) that the pendulum is independent of the friction of unlocking, because that is done by the little remontoire weight, which is stopped for a moment as it descends on to the pallet arm by reason of the inertia of the pallets and their arms. was also the case in the late Captain Kater's escapement, which is described in the Transactions of the Royal Society, but is too complicated for use. And indeed the contrivers of all such escapements should remember, that

* It is a bare act of justice to the other exhibitors to mention, that in this desire to acknowledge the reputation of makers whose works have been tested by a much better of makers whose works have been teated by a much better criterion than we had the means of applying, we were nearly mitted into giving a Medial to an exhibitor of astro-nomical elocks and watches, on the ground of his being really, as he very compleuously designated himself; "Maker to the Royal Observatory." We fortunately succrained from the best authority that the only ground on which this presens obsistinguished himself from all the other exhibitors was, his having once performed certain services for the Observatory establishment, by no means of a high order, and even those performed in such a way that they have been discontinued, and are particularly unlikely to be no new escapement has any chance of coming into use unless it is as cheap and easy to make as Graham's, and is really so independent of the force of the train that a common house-clock movement will do as well for it as a well-finished train with high-numbered pinions; an experiment which the makers of remontoire escapements

seldom venture upon.

We have also given a Prize Medal to M. Dunors, of Lock (No. 9, p. 1266), the only Swiss maker who has exhibited a pendulum clock, for a regulator, with a gridiron pendulum in which the compensation is adjustable, and an escapement, which is a sort of imitation of the chronometer escapement. A construction of much the same kind was suggested by Mr. Airy, in the Cambridge Philosophical Transactions, in the year 1827; and we do not mean, by giving this Medal, to express any opinion on the probability of such an escapement super-

seding the ordinary one. Besides these escapements, which are all intended exclusively for astropomical clocks, there is one lately patented by Mr. C. MacDowall (No. 68, p. 417), which is intended as a substitute, not only for Graham's escape-ment, but for the common recoil escapement; and we are informed, as a proof of its cheapness, that a tender has been made to supply clocks to a public office, either with this escapement, or the usual recoil escapement, at with this escapement, or the usual reconstruction, the same price. Instead of a scape-wheel there is only a small disc, with a single ruby pin set in it, very near the arbor: the disc turns half round at every beat of the pendulum; and the pallets are both together on an arm, pendulum; and the paliets are both together on an arm, which may be the cratch of the pendulum, or may be in the pendulum-rod tixelf; and they are so formed, that the impulse is given chiefly hy direct action across the line of centres, and not obliquely, as in all the anchor exapments, and therefore with less friction. It is also a dead escapement, and by the simple addition to it of two long teeth or arms for the locking part (on the principle of the duplex escapement in watches), the friction on the dead part of the pallets may be reduced almost to nothing, in clocks intended for very securate performance. Mr. Macdowall is now making a clock with a remontoirn escapement, on the same principle, which may evidently be as well applied to such an ecopement as to impulse He has also successfully applied it to a escapements. lever-watch.

The greater velocity of the disc than of a scape-wheel renders another wheel in the train necessary; but as the elock, notwithstanding, goes with even a less maintain-ing force than usual, the friction of this extra wheel is evidently compensated by the diminished friction of the escapement, in consequence of the impulse being given

directly instead of obliquely,

We are quite aware that an escapement, in general appearance similar to this, was made some years ago, both in England and France; and specimens of it were produced to us from each country. But in both those speci-mens there was a roller instead of the fixed pin in the disc; and, what is perhaps of more consequence, they both had a much larger angle of escape than Macdowall's clock, and consequently, required a larger vibration of the pendulum: and we are not surprised that escapements so made had never come into general use, which was ad-mitted with respect to the French one; or had been abundoned, as those who produced the English one as-sured us that it had been long ago. Mr. Macdowall's escapement avoids the stuke and the uncertainty of a roller, and does not require a larger arc of vibration than a common clock; and, on the whole, we think that it combines, in a high degree, the several qualities which we are directed to regard in our distribution of prizes, viz., simplicity, chenparss, durability, and at least pro-bable accuracy of performance, and therefore we have given Mr. Macrowall. (No. 68, p. 417), a Prize Medal for what he calls his "single-pin escapement."

Torret, Clorke

After astronomical clocks, those which are intended for public buildings are of the greatest importance. In-deed, in some public clocks a degree of accuracy may now be properly required, as it can be obtained, exceeding that of most astronomical clocks. Considering the number of persons who make turnet-clocks in this country, the smallness of the number of them in the Exhibition as rather surprising; and those which deserve any favourable notice are still fewer. It is remarkable, too, that the us to deserve such notice, are two clocks with eastiron wheels; and they are both of them such as ought to convince anybody, that the prejudice against east-iron clock-wheels is altogether unfounded, now that they can be made so well that the teeth do not even require touch ing with a file after they come ant of the mould. of these clocks also have a remontoire apparatus in the going train, the effect of which is, that the escapement is driven, not by the great clock weight, but by a small weight, or a spring, wound up at intervals by the train, which is discharged like a striking part, or in some other way, at every minute or half minute, by the revolution of the scape-wheel. Most of the turret-clocks in M. Waq-NEA's collection : No. 736, p. 1215), which will be noticed presently, are also un the remoutoire principle. And there can be no doubt that, since it can be applied at a moderate expense, all turret-clocks of high character, at least if they have large external dials, ought to be so made, because it renders the escapement independent of all variatious in the force of the train, which are sometimes very considerable, and also allows a sufficient weight to be applied to the clock to drive the hands in all weathers, without making the pendulum swing too far; and moreover, as the hands of a clock of this kind do not move an almost invisible quantity at every beat of the pendulum, but by a very sensible jump at every letting off of the remontoire, the time can be taken from the minute-hand, at a considerable distance, as accurately as from the seconds-hand of a regulator; and for the same reason the striking part is also discharged mure exactly

at the right time. As regards the going part, the principal advantage of cast-iron wheels over brass or gun-metal is their much greater cheapness. But in the striking part they have greater chimpions, and in the straing less any more the further advantage of greater strength, which, in large clocks, is the chief thing to be attended to, and the ing in which they are most frequently deficient. In with a very light hammer; but the clock has only a small hemispherical bell nttached to it, and we have no proof that this very ingenious contrivance, in which neither fly nor hammer-spring is required, would answer for a large bell, such as that on which Mr. DENT's clock strikes, or even a much smaller bell of the usual form. In the latter elock the hammer is raised by broad cams cust on the great wheel of the striking part, and of such a shape, and with the lever so arranged, that there is the smallest possible waste of power: in fact, very little more than non-fourth of the force of the great striking weight is lost in friction, the resistance of the air to the fly, and in the necessary interval between the fall of the hammer and the beginning of its next rise, -s proportion which is much less than usual,

mBeh Mr. Beauers's No. 130; p. 422 and Mr. Devri-(No. 5, p. 44; 41) clucks have compensated perdulums. The former has a test and hence composation, which, Mr. Bolevier say, is made in accordance with inwhich, Mr. Bolevier say, is made in accordance with inmetals; though it differs from the result of all the ordinary tables of expansion, the length of the brance of the contract of the contract of the conolinary tables of the contract of the conordinary tables of the conordinary tables of the contraction of the contraction of the contraction of the conbinary tables of the conbinary tables of the contraction of the con-traction of the con-the con-traction of the con-tr

tested for severa years.

Mr. Roberts's excupation is a new one of his new conMr. Roberts's excupation of preview in linguished on a
roller at every hiteraste best. The remonstrire is on the
endless chain plan, which is described in Reid's book on
clock-making, except that the mode of letting off is
different. The form of the clock-frame is pramaidal,
with the pendulum hung from the top; and it is consequently very steady, provided the floor its stands on be

set though the plan of fluing turret-clecks on bassan let into the wall for the parpose, is, in most instance, stendier than any fixing to a floor can be. All the standard particles are all the particles of the particles of the standards because of the casting and the form of the wheels, the the poolenes of the casting and the form of the wheels, the theory of the casting and the form of the wheels, the standards of the particles of the particles of the theory of the particles of the particles of the particles to the manifecturing of these elects be in able to cell drew at a much lower price than small. On the whole, the manifecturing of these elects be in able to cell drew at a much lower price than small. On the whole, the manifecturing of these elects be in able to cell drew at a much lower price than the contract of the such as the particles of the companies of the mode of strating, or some other perfurition of this clock, we consider it will de-

serving of a Prize Medal The escapement in Mr. Dent's clock is the ordinary pin-wheel dead escapement, but the wheel is smaller than asual, being only four inches in diameter, and it contains forty pins. It is driven by a spiral spring, which is merely part of a large watch-spring, and is wound up a quarter of a turn after every quarter of a turn of the scape-wheel. The pinion, or small-wheel to which one end of the spring is fixed, does not ride on the arbor of the scape-wheel, in which case there would be consider able friction between them, but on a stud fixed into the clock-frame; so that the scape-wheel is driven by the spring without any friction whatever, except that of its spring without any friction whatever, except that of its own pivots, and the very small friction which is due to the upward pressure of the code of the remonitoric fly on the arbor of the scape-wheel. The consequence is, that there cannot possibly be any variation in the force on the pendulum, except that which may arize in the escapement itself, if the pallets are not properly oiled, -as in all other anchor or pin-wheel escapements. It may be worth while to state that the variation of force in the spring due to changes of temperature, if it were ten times as great as it is, would produce no sensible effect apon the pendulum. And as this pendulum is eight feet long, and weighs above two cwt., such a clock may be reasonably expected to go as well as any astronomical clock; and, in fact, it has gone since the opening of the Exhibition, at least as well as a highly-finished astronomical clock, which was placed by the side of it, and every week com-pared with the time brought from Greenwich.

The maintaining power for keeping it, going white wishing is of an econtraction; at the common syntage, wishing is of an econtraction; at the common syntage with the several maintain to writing. A Conneil Medal has been awarded to Mr. Dexy (P. 413) for this clock, on the recommendation of all the members of this Jury, except the Chairman, who declined to express an opinion spone it, no account of having himself fermished the design. But as it contains hardly anything which had not been either previously assed by Mr. thing which had not been either previously assed by Mr. to the adoption of any other maker, he is entitled to full credit for first as well as for his enterprise in attempting to

Since the close of the Exhibition, we have been informed that the accumulated error of the large clock, from the 8th August to the 15th Cetober, was - 2 · 8 accounds; or, in other words, the pendulum lest not quite two bear in the four millions of vibrations it performed during that

introduca a new description of clock, possessing both greater accuracy and greater strength than usual, and one which can be made for less money than equally large turret-clocks, of the common construction and of good

Me have already referred to M. Wannen's (of Paris) (p. 1215), collection of turret-clocks which displays great firtility of invention; and we have awarded him a Council Medal for the collection, but especially for his clock with a continuous motion, intended for the purpose of driving equatorial telescopes, so as to keep them poat any given star, and for all other purposes for which a continuous, instead of an intermittent motion is required. The mode by which this is effected is particularly inge-nious as well as simple. In this, as in several others of M. Wagner's clocks, there is a gravity remontoire appa ratus, on the bevelled-wheel principle, an the arbor of the wheel below the scape-wheel. For the construction of these remontoires we must refer to books, as it would be difficult to give an intelligible description of them without drawings; but assuming that to be understood, the arm which carries the remoutoire weight is in this clock prolunged to a convenient distance, so as to carry a kind of bell hang to it by a couple of wires, and within the bell a fly is driven by a train of wheels connected with the great wheel of the clock. This fly is so adjusted, that the velocity with which it allows the train to move is count to the overnoe velocity which it would have if connected with the pendulum, or to the relocity of a train with a revolving instead of a vibrating pendulum of the same period. If the force on the clock be too great, the remontoire arm becomes raised above its average height, and the bell rising with it lets in more of the external air upon the fly, which reduces its velocity, and vice versi. In this way, the hand, or telescope, attached to that part of the train which has the continuous motion, is always

made to keep pace with the average velocity of the scapiwheel with its vibrating pendalman. M. Wagner has exhibited a mavement of this kind. M. Wagner has exhibited a mavement of this kind. M. Wagner has exhibited a mavement of the kind. M. Wagner has exhibited a mavement of the perfect of gravity, as in Attwood masshine. The barrel revolves in a second, and by the side of it a weight descends rely in a grower, with an inked branch attached to it; and as the barrel revolves, the falling branch traces a curveture of the control of the size of the size of the control of the size o

revalve.

Two of M. Wagner's thrret-clocks have this same breeled-wheel remontoire in the train, only with a provision for letting it off at every half-minute, instead of a continuous motion; and one if them has a remostoire excepment also, but by an messas incapable of tripping; if

the force is increased.

There is under elock in the same collection which deserves particular notice on account of there being a remostoric in it, without any additional wheel in the train.

This is managed by setting the second wheel in a swingresponding to the second wheel in a swingter of the second wheel. In this clock, also, the pallet are set in the produlum without any cratch, the scape-

wheel being put outside the frame.

Another of M. Wympre's elecks has an exceptement with
a direct recoil, as in Harrison's once fiamous but long noy
almondoned exapement; and in this clock, also, the pallete
are set on the pendulum without a crutely. It is certainly
a superior ceutivance to Harrison's, although, as in his,
the recoil is necessarily very great and sudicin.

All the smaller clocks in this collection have cart-iron

All the smaller clocks in this collection have excitions striking parts, being the two large meas are of laras, probably for the sake of appearance; and they all atrike the control of the control of the collection of the collection of them have two bour-hammers, striking alternately, and none of them appear to have larreds of inflicient length, in properties to the number of artifixing alternately, and without the rope going twice over the barred. They have also compensately ephalmans, all on the lever principles, and compensately ephalman, all on the lever principles, fixed to the har at the top of the clock-frame, on a to draw up the produktion pring through a still in the clock.

The lever compensation seems to be the only one used in France, except occasionally the gridinon pendulum, with nice bars of tenes and steel. In English elocks, hardly any compensation in now saice, except the mercurial cylinder in the best actronomical elocks, and the rine tube

compensation in clocks where the mercurial pendulum would be too expensive. We have given a Prize Medal to M. Govrana (p. 1204),

a naker mf some celebrity is France, for a small wellcecuted turnet-clock, with a train remeastrier of a different construction from any af M. Wagner's, the remonstorwheels being employed in changing velocity, or as part of the clock train, and not merely in changing direction, which is the case in the berelduct wheel remonstors. which is the case in the berelduct wheel remonstors. M. Craxix (p. 1200) and by M. Battax Cowers (p. 1977, which we meanton an account of their extraor-

House Clocks.

In what are called by the Freude civil clocks, or clocks for domestic mar, there is not much room for difference, except in the merely ornamental parts, which we have various chapes, in the English part of the Fathhilots, as well as the foreign, and most of them sufficiently good for their parpose. Dail it is impossible to claimagein any well as the foreign, and most of them sufficiently good for their parpose. Dail it is impossible to claimagein any the text as well justify us in giving Mechas for them, because such Mediac could only mislead the public into the belief flatt there are not many other makers from the light of the parts
while to exhibit any.
Among the French exhibitors, however, we have given a Prize Medal to Measts. Derocene and Bornes (p. 125), who exhibit a very handome collection of well-produlinas and meconamon exceptements, and with what is called equation sevels, or a hand to take wall as a mean time. They also exhibit some of their pinions sparanticly, which are very well made. Allogether, their sparanticly which are very well made. Allogether, their

We have also given a Prize Medal for small clocks tn M. Baocor (p. 1199), the originator of an elegant and popular form of a nearly dead escapement in ornamental clocks, in which the pallets consist of semi-cylinders of jewels, at right angles to the plane of the scape-wheel. These clocks are generally made with the escapement in front of the dial, so as to be visible, and also to allow the scape-wheel to be taken out without disturbing the rest of the clock-

In addition to these Medals, which we have awarded chiefly on account of the good execution or arrangement of the movements, we have given one to Mesars, REVDER and COLIN (No. 984, p. 1226), who exhibit a number of house clocks of various kinds, all remarkable for the lowness of their price, and sufficiently well executed for the ordinary uses of such clocks. And in speaking of cheap house clocks, of course the American clocks ought not to be unnoticed, though we have thought it unn sary to attempt to distinguish any of them by a Prize Medal, as they are all substantially alike; and they are now so universally known for their cheapness - a qua which generally receives its own reward—that the addi-tional distinction of a Medal on that account would be more than usually apperfluous. There is, however, one quality for which they are entitled to greater credit than quality for which they are crititled to greater credit than is generally known, and that is the small weights or nowing force which they require, showing that there is much less power wasted by friction and the inertia of the train than in most other clicks. The small amount of inertia is caused by the lightness of the wheels; and the small friction (which certainly cannot be attributed either to the high finish or high numbers of the pinious) is accounted for by the use of lautern pinious, which (when driven by the wheels) have much less friction than leaved pinions of such low numbers, and are also less liable to be clogged with dirt, and are less affected by the wheel-teeth being insecurately cut, as they generally are in clocks of much greater pretension than these.

rally are in clocks of much greater prefension than these. To this class of domestic clocks helong the various forms of striking and chiming clocks, and alarums, and also tell-take or watchmen's clocks, and alarums, and long time without winding, and perpetual almanse clocks, whatever be the number of phenomena which the clocks, whatever be the number of phenomena which clocks, whatever be the number of phenomena which they profess to show. There is now so little difficulty in making these things, and so little use in most of them when made, that we do not think it necessary to distinguish any of them by a Medal, although in some in-stances they display ingenious contrivances for effecting their different objects. The Jury, however, agreed to mention some small alarum clocks by M. Pirsury, of Paris, (No. 958, p. 1225), on account of their cheapness. and because alarms really are, for certain purposes, useful articles of household farniture.

The only horological instruments which remain to be

noticed are watches, in which term are included carriage clocks, since these are, in fact, only large watches, set in cases like those of small clocks, and with the balance placed at right angles to the rest of the wheels, so that its axis may stand vertically, because it vibrates with less friction in that position-a fact of which some of the exhibitors do not seem to be aware.

Watches, like house clocks, are so much an article of general manufacture, and there is so little difference in the quality of those of several of the best makers, that it is difficult to establish any principle on which prizes can be given for them, except with reference to the general reputation of the exhibitors of articles which appear in

themselves to be good.

The three principal places in England where watches are made, are London, Liverpool, and Coventry. Among the London makers, several who have received Medals for chronometers or other articles, would have been entitled to receive them for their exhibition watches ale There is a very beautiful collection of carriage clocks and watches, of various kinds, by Mr. DENT; some of em exhibiting, besides the compensated balance, which them exhibiting, besides the compensated balance, which all first-rate walches now possess, a contrivance (different from most others for the same purpose) for winding ny and setting the hands without a key, by turning the knob in the handle of pending; and others having what is called a split seconds—hand, that is to say, two seconds—is called a split seconds—hand, that is to say, two seconds—

hands, which travel together and appear as one, till you move a pin in the case, whereupon one of the has separates from the other, and stops until you move the pin again, when the hand starts forward and rejoins the proper seconds-hand, after any length of stoppage; and this is done without the use of an independent train to drive the extra seconds-hand. There are various condrive the extra seconds-used. There are trivances, of different kinds, for the same purpose, among trivances, of different kinds, for the same purpose, among trivances, of different kinds, for the same purpose, among trivances, and the same purpose, and exhibits a night-watch, or a watch for blind persons, technically called a toc-watch, with an external hand, which moves round with the hour-hand, and the position of which can be felt with tolerable accuracy, with refer-ence to twelve studs set round the rim of the case, for the twelve hours, reckoning of course from the handle. There is also a watch similar to this among the Swiss ones; but Mr. Deut's has a special provision to prevent the position of the hand from being altered by the set of feeling it. He is to be considered as entitled to a Prize Medal for his collection of watches, independently of the Council Medal awarded to him for the large clock

In like manner the Prize Medals awarded to Mr. C. FRODSHAM (No. 51, pp. 414, 415), and Messrs. Pan-aisson and II. Frodsham (No. 35, p. 411), for chro-nometers, are to be understood as awarded also in respect

of their exhibition of watches

The former of these exhibitors states that his watches are made on a certain caliper (as the watchmakers call the working plan of a watch), in which the sizes of the wheels are determined according to a set of rules, partly arbitrary and partly founded on experience, according to the size of the barrel, or, in other words, according to the power of the mainspring. All makers of watches on a large scale must have some such system of their own but Mr. Frodsham proposes that a general system shall be adopted, in which the sizes of the various pieces of a watch shall not be expressed by the usual conventional numbers, known only to those who have to use them, but in decimals of an inch, and according to certain tables of proportion with reference to the size of the barrel, as above mentioned. It would probably be convenient if some such system were adopted, either according to Mr. Frodsham's rules (so far as they are arbitrary), or any others which might be generally agreed on.

Such a system as this is still more completely carried

out by Mr. Rozente's watch-plate drilling machine (No. 130, p. 422), a most ingenious and apparently successful invention, by which any given ealiper or propor-tion of the parts of a watch of any size can be at once transferred, by a mere mechanical process, to any other watches of any other sizes; piercing all the holes required for the pivots of the wheels, and other purposes, with unfailing accuracy. And in connection with this machine there is a sector for proportioning the sizes of wheels for any required number of teeth, also by a mechanical operation without the necessity of calculation. The Prize Medal before mentioned as given to Mr. ROBERTS (p. 422) for his cast-iron clock is therefore to be con-sidered as awarded equally in respect of his watch-plate drilling machine.

It should be mentioned also that he exhibits some It should be mentioned also that he exhibits some watches with a remonstoire ecospement, and one, which he calls a rerorder watch, with two seconds-hands, of which one can be stopped to denote the exact time of any observation, as is done in various other watches in the Exhibition. Indeed, the number of them is so great that we have not been able to give a Prize Medal to any washes called. we have not been able to give a rrise meetal to any maker folley on account of such a contrivrance, except to M. Riggessoc (No. 1885, p. 1257), a well-known watch-maker of Paris, for his watches with a second-hand, which, on tooching a pin nt the time of observation, makes a black apor on the dial; and this can be repeated

masses a macs spot on the dial; and this can be repeated at very close intervals, so as to record the exact epochs of a number of observed phanonsens succeeding each other very closely, without the necessity of taking the eye off the object to be watched for in order to look at the dial. What are called the movements of watches and small clocks are made by machinery, on a very large scale, by MM. Japy Brothers, of Paris (No. 275), to whom we

have awarded a Council Medal; although the objects themselves, as they appear in the Exhibition, are by no means striking, inasmuch as these watch movements are in fact only the two plates and some of the larger wheels of the train, and the clock movements are the internal parts of the clock without the escapement. The most, indeed the only, remarkable quality in these movements, is their extraordinary cheapness. They are, bowever, at least as good as any others of the same kind made in the usual way by hand; and Messrs, Jarv, we are told, sell no less than half a million of them to watch and clockmakers in the course of a year. The great cheapness of these articles being obtained by means of a peculiar pro-cess of manufacture, it was considered that Messrs. Jupy might properly receive a Council Medal for their watch movements, as a specimen of the produce of such improved mode of manufacturing.

Messrs. ROTHERHAM, of Coventry (No. 124, p. 419), exhibit a large collection of watches in all stages of manufacture, for which we have awarded a Prize Medal We have also given one to Mr. Rosaget, of Liverpool (No. 123, p. 419), an eminent maker, who exhibits a handsome collection of watches and small clocks, some of which are so constructed as to show the action of the various forms of watch escapements in general use; and to M. Redien, of Paris (No. 1425, p. 1244), for a chesp kind of watch alarum, of which a great number are sold both in France and in this country.

It may be mentioned here that M. KRALIE, of Pesth (No. 169, p. 1016), exhibits a set of models, in which thirteen different escapements can be fitted to one clock movement, by merely unscrewing the part containing the escapement. This is apparently intended for illustrating fectures on watchmaking, or for experiments on the

offects of different escapements,
Mr. Jackson exhibits what he calls (with some disregard of etymology) a seliclare watch (No. 32, p. 411), whereby he means a watch with a solid key. However, his invention of the thing fortunately deserves more eredit than his name for it. Most people are aware that the pipes of watch-keys wear out; and, in so doing, they wear off the corners of the winding square on which they act. The shorter this winding square is, the sooner of course this will happen; and in thin watches of the common construction the winding square cannot but be short. With the view of avoiding this, Mesars. AUDANT and KLASTRUERGEN'S watches (No. 52a, p. 412b, and several foreign ones in the Exhibition, which have no fusce, have the arbor of the burrel bollow and squared for a solid key to fit into it the whole depth of the barrel. But this will not do for watches with a fusee, because the fusce arbor has to turn while the watch is going, though the barrel-arbor of a watch without a fusce only turns while it is being wound up; and a hollow fusee arbor would be much too thick. Mr. Jackson, therefore, winds up his fusee by a small auxiliary wheel, analogous to what is called a jack-wheel in turret-clocks; and the arbor of this small wheel is made hollow and squared to receive the solid key. As the little wheel has nothing to do, and no pressure on it when the watch is going, the friction of its thick arbor is inconsiderable, even supposing it not to be thrown out of gear, as it might be. This also allows the fusee arbor to be smaller, and there-fore to turu with less friction than usual. We have consequently given Mr. Jackson (p. 411) a Prize Medal for this invention,

We have also given a Prize Medal to M. MONTANDO of Paris (No. 601, p. 1207), for his mainsprings, of which he is a maker of high reputation; and it is unnecessary to say that the goodness of the mainspring is of great importance to the accurate performance of watches, especially of foreign ones, in which there is generally no fusee, and, so the spring must be empathe of acting with nearly uniform force for four or five turns of the barrel. We agreed to mention the names of two other French

watchmakers: M. La Roy (No. 1186, p. 1234), for a col-lection of well-finished clocks and watches: and M. Lau-MAIN (No. 292, p. 1190) who exhibits some well-made pocket chronometers, with the escapement part made to take off separately: as well as the name of Mr. Boaron

(No. 94, p. 418), an English exhibitor of some very chesp watches in German silver cases.

cheap wateres in terman surver cases.

The Swiss exhibition of borology consists entirely (with the single exception of a clock before mentioned) of wateress and water-work; and, as is well known, a large proportion of the wateress of the world, especially the small and cheaper ones, are made in Switzerland. But in this instance, as in some others, it is not to be inferred that we intend the superiority of the works of one nation over another, in any particular department, to be measured by the number of medals which have been awarded to each, as they were given on no such consi-

derstion. We have given Prize Medals for watches to the fol-We have given Prize Medals for watches to the following Swins exhibitors:—Messrs, Aluerhaus (Swinzeland, No. 22, p. 1267), GRANDIJAN (No. 8, p. 1260), GROGELADER (No. 24, p. 1268), LECOLITER (No. 26, p. 1268), LECOLITER (No. 26, p. 1273), PATEX and PHILIPPE (No. 99, p. 1273), and Rieron (Nu. 101, p. 1273), except that for the last a grant of money has been substituted. luted

M. AUDEMARS (No. 22, p. 1267) exhibits a watch with a contrivauce for winding up the train which is required a contribute to vinding in the train which is contained for driving what is called an "independent secondshand," as well as the ordinary train, by the handle or pendant, so that when either train is fully wound up, the winder acts on it no longer, but proceeds with the other train alone. He has likewise a watch with several dials, one of them indicating one-fifth of a second, and with provisions for stopping the different hands independently. It may be mentioned here that Messrs. Cousins and WHITTSIDE, of London (No. 86, p. 417), also exhibit a large watch with a stop seconds-hand, indicating one-sixth of a second. M, Andessers' collection contains various other watches, with different kinds of escape-ments and other peculiarities, which cannot be particularly described here.

M. GRANIJEAN (p. 1266) exhibits some pocket chronometers, i, e., watches with the chronometer escapement; and one of them has a balance-spring of a spherical form instead of a flat or a cylindrical one,

M. GROSCLAUDE (p. 1268) has sent some watches with "independent seconds-hand," and only a single main-

ring. M. Lecoultrae's (p. 1283) watches are remarkable for the good execution of the wheels and pinions. He is stated to make all his watches with the corresponding wheels of the same size, so that when any wheel is daranged, it can at once be replaced by a new one without any other trouble than that of putting it in. And he, like some other makers, has a method of winding up and setting the hands without a key, and with a provision to avoid the risk of a slight derangement of the hands in the act of patting their adjusting work in gear, to which some other methods are said to be liable.

M. MERCIER (p. 1277) exhibits among other well-made articles, a watch with a new recoibing escapement with a double scape-wheel, which is ingenious and simple; but we do not profess to give any opinion on the probability of its success.

MM. PATER and PHILIPPE (p. 1273) exhibit a large and valuable collection of watches and pocket chrone Their articles are generally of moderate price, befinished. They have n repeater with two barrels, both winding in the handle, and a watch for the hlind. They are the makers of the very small watch only '55 of au inch in diameter, which attracted much notice as the smallest in the Exhibition

We have recommended M. RETOR (p. 1273) for a re-ward in money instead of a Prize Medal, as we understand that he is a person of very small means, who has had some difficulty in getting up the articles which he has sent to the Exhibition, and that he is also engaged in making experiments in watchmaking, which are of course at present unremunerative. He has exhibited a

pocket chronometer with an ingenious escapement.

We conclude the notice of the Medals to the Swiss exhibitors of watches with the award of a Council Medal to M. Lurz, of Geneva (No. 94, p. 1272), for his watch

balance-springs. On the holance-spring, more than any other single piece of a watch, its isochronism depends; and these springs present a marked difference in some of their qualities from those of any other exhibitor (even of some who specially directed our attention to the alleged superiority of their springs), inasauch as they bere the tests both of heating and stretching out neorly straight without at all altering their permanent form, which was

not the case with any other springs which we tried.

Besides these, we agreed to make Honourable Men-Devices these, we agreed no make presentance error among we even or one super-mass a non-necessary to the following Swiss excluding or of the send watchers:—ELFRORTH (No. 78, pp. 1271, 1272), the nuker:

The following is a summary of the awards in this of the send watch in the cal of a pectic-test; flow (1000).

(No. 31, p. 1268), Courvoisier (No. 34, p. 1268), Messicos (No. 15, p. 1264), and Messer, Baron and Unitarias (No. 74, p. 1271); also of M. Favie Brandt (No. 23, p. 1267), on account of his ingenious instrument for tracing out (not cutting) the teeth of watch-wheels in

the spicycloidal form. And lastly, we have awarded a Prize Medal to M. Ilrsort, of Sardinia (No. 33, p. 1303), for his watches and watch movements, and for a machine for rapidly polishing the teeth of the scape-wheel of a horizontal or

E. B. DENISON, REPORTER.

CLASS Xc.

REPORT ON SURGICAL INSTRUMENTS.

The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

Jury.

J. H. GREER, F.R.S., Chairman and Reporter, Hadley, Middlesex. Dr. Thomas Channouses, United States.
JAMES PILLE, 67 St. James's Street; Surgical Instrument Maker.

Dr. ROUX, France. Dr. LALLEMAND, Fran W. LAWRENCE, F.R.S., Whitehall Place; Surgeon to Bartholomew's Hospital.

THE Jury have the honour of submitting to Her Maesty's Commissioners the following Report, under the impression that the task has been confided to them of furuishing an intelligible account, as far as may be derived from an inspection of the contributions to the Great Exhibition, of the present state and condition of the art of nufacturing surgical instruments.

The relation between the instrument employed and the scientific objects of the surgeon, is, however, so intimate and essential, that in order to arrive at a just conception of the scope of the instrument-maker's business and art. of the scope of the instrument-maker's business and art, it will be necessary to make some brief observations on the purposes of surgical instruments, and on the condi-tions of what may be properly called improvement in connection with the art and science of surgery. The instruments of the surgeon may be regarded as

aids to those organs by which, on the one hand, man receives the notices of outward objects, and on the other, to those by which he re-acts upon the external world-namely, his senses, and as the representative and vicegerent of the motive powers, his hands. By this armature, then, of the seases and hands, and in proportion as it is efficient, is he codowed with the means of assisting and relieving those who require his services. There is, however, this peculiarity in the surgeon's instruments, that they are scarcely otherwise employed than in operations mn living and sensible parts. To supply such aids as the surgeon requires is the husiness of the instrument-maker; often only as the mechanical artificer, but not unfrequently contributing, by his inventive ingenuity, to carry out more commistely the surgeon's designs. The art of the more completely the surgeon's designs. The art of the instrument-maker has, indeed, a twofold character. He has, in the first place, to arm the operator for the various exigencies which his office implies—for example, with knives, saws, and the like, for removing parts which have been spoiled by violence or disease; with tourniquets, and other means, for arresting bleeding; with needles, for elosing wounds; and with the various means for ascertaining the presence and for the extraction of foreign bodies: and, in the second place, he has to supply the needs of the matilated sufferer, and to furnish compensation for defects, as far as such can be mechanically provided, in the shape of crutches, supports, and bandages, and of artificial eyes, palatos, and even limbs. He must be then an able mechanist, and such, be it said of the credit of instrument-makers, he will generally be found. But with, and almost in proportion to, his mechanical ingenuity arises the danger that it will induce him to adopt in his works unnecessary mechanical refinement and pernicious complexity; for, if the principle above enunciated be correct, it may be admitted that the nearer any instrument, consistently with its use, approaches to the organic simplicity of the hand and fingers, unembar-

that, as it necessarily stands in intimate relation to the advance of surgical science, it cannot but exhibit a tendency to the same simplicity that characterises improved operative surgery-perhaps by discarding as useless a whole group of instruments, always by the gradual intro-duction of methods which require lewer and less complex instruments; or if the aid of new instruments be required. it can scarcely happen but that those answer their purpor best which are in accordance with the principles already

laid down. Let the surgical student look into any old book of surgery, with its quaint cuts and illustrations, - such a work as Heister's, for instance, which is intended especially to afford information on the apparatus and instruments of this science, and he cannot but be at once struck with the cumbrous, coarse, and complex character of the instruments, when compared with those now in nsc, which are intended to accomplish the same objects. A remarkable illustration offers itself in the formidable array of tools which were employed in the operation of trepanning But further inquiry will also show that, in consequence of the improvement of the healing art, many instruments may become altogether nseless. What surgeon would think of having recourse to the terrible cauterizing irons, formerly in use for the purpose of scaring the pulpitating stump after amputation, and of preventing the otherwise inevitable death of the patient by bleeding? This har-barous method, which rendered the operation dangerous, and the healing of the wound tedious, was, as known, happily rendered unnecessary by the celebrated Ambrone Pare, who adopted the simple expedient of tying the blording end of the divided artery.

In the above instance, the cauterizing irons, as far at least as dependence on their use in arresting hemorrhage was concerned, were banished for ever from the equipment of the sargeon. But if amputation, in this case, was robbed of the greater part of its terrors and dangers, so great a step in the amelioration of operative surgery might not unnaturally beget a hope that, by the advance of surgical science, in consequence of a better knowledge and elearer insight into the laws of the animal economy, and elearer insight into the laws of the animal economy, the operation of amputation itself might be dispensed with, or limited to the fewest possible emergencies. Would that it were so, at least in all the diseases under which it is still unstroidably adopted in that in one instance, at all events, the genius of John Hunter has enabled surgeous to discard it, and to supersede its employment by a process at once simple, effectual, and almost void of suffering. In the disease called ancurism, produced by the yielding at some point, of the coats of an arterial trunk, until it bursts externally, and the patient dies of loss of blood, Hunter tought surgeons, instead of depriving the patient of a limb, as had been most commonly heretofore done, to raced by mechanical details and complex dalgations, the nearly will be its approach to perfection.

If we now turn to the progress of improvement in the construction of surgical instruments, it will be found on which contributed to the increase of the disease, and they contributed to the increase of the disease. this mild plan of treatment may be superseded, in many cases, by the simpler method of a merely graduated com-

344

pression on the exterior of the limb It might seem, then, that the skill of the instrument-maker is destined to be less and less required in the progress of the healing art; but if his ingeauty may or un-balked of its fruit, sometimes it would appear to be evoked by the very improvements which are the pledge of the advance of surgery. A remarkable instance in point is the comparatively recent operation of lithority, the prin-cipal merit of which will be cheerfully accorded to the ress of the healing art; but if his ingenuity may be thus French surgeons. The only method of effectually relieving a sufferer from the torture and health-destroying consquence of stone in the bladder had been by cutting into the part, and by extracting the stone through the wound, which, in such cases, extends deeply, and involves parts which it would be dangerous, or even fatal, to injure. But by the novel process entitled lithotrity, instruments, ingeniously contrived for the purpose, are in-troduced into the bladder, and, in the hands of a skilful operator, are made to break, crush, and pulverize the stone, without the necessity of any incisious, and without those dangers to the patient which attended the operation of lithotomy. Here the aid of the mechanist was called in to contribute to the success of one of the greatest triumphs of modern operative surgery; and though the various modifications of the apparatus may have been suggested by surgeons, it may be safely said that the insuggested by surgeons, it may be sairly and that the in-struments would not have reached the perfection they have attained, as shown in the present Exhibition, without the skill and ingenuity of the instrument-maker, should be remembered also, in connection with this subject, that Sir Astley Cooper devised a plan of extracting stones from the bladder whole and entire, when of small size, and that it was successfully carried out by means of an instrument constructed by the late Mr. Weiss, who will ever be regarded more as an artist than as a mere arti feer, in the line in which he earned his deservedly high

reputation. If, then, the improvements in the apparatus and instruments of surgeons, during the last half-century, be con-sidered in the spirit here vindicated, they will be found to depend on simplification, and if on novel appliances, yet on inventions, which have afforded new means of relief to the sufferer, or have tended to introduce the gentler and less forhidable methods of operation, which are ever the characteristic of the enlargement of surgical knowledge. Among these, besides the cupital instances addreed of modes of instrumentation of proved efficacy for relieving the sufferings of stone in the bladder, there may be mentioned—the stethoscope, invented by the celebrated Larance, for aiding the car in examining the morbid sounds of the chest, and which is not without its use to the sargeon; the stomach-pump, the valuable auxiliary in the treatment of poisons; Weiss's dilutor of the female urethra, for the purpose of facilitating the extraction of foreign bodies from the bladder; the water bed of Dr. Arnott, calculated, in all cases, to afford equal pressure in lying, and to prevent or remove the suffering and danger of bed-sores; various apparatus for facilitating and improving the treatment of fractures, especially the bed invented by Mr. Harrold for fractures of the spine, and the useful appliance of the gummed roller; the in-struments for the cure of ancurism, by the graduated compression of the artery leading to the suc; the mecha-nical contrivances in aid of orthopardic processes; and the different forms to which caoutehoue has been made available in air and water-cushions, and in a variety of andages and similar surgical appliances,

With these premonitions the Jury now proceed to give a brief synopsis of the contents of the present Exhibition.

Instruments deserving notice,

In looking over the assortment of instruments, which display not only all the ordinary contrivances required by the surgeon, but many novelties and ingenions adaptations and combinations, we may notice—in the instruments for operations on the syst—specula, knives, needles, scissors, hooks, which are admirably calculated for the deliency of the requirite manipulations. In those for operations or

the ear, some novelties for the exploration of the meatus auditorius and Eustnehian tube, and for the removal of polypi and foreign bodies from the external passage; an instrument for perforating the membrana tympani; and we instrained for personants the memorana typiquam; and we may add to these a warely of accountie centrivances for aids to imperfect hearing, many of which are so contrived as to imperfect hearing, many of which are so contrived as to the disguised as articles of furniture or personal attire. In those for operations on the more, weath, and pharyar, some modifications of the forceps for the extraction of polypi syringes for injecting the nares and antrum; a variety of tonsillar guillotines; staphyloraphic instruments, and new aids to dental surgery, especially Gilbert's chair, with a fulcrum, and instruments adapted to the forms of the several kinds of teeth, for their more easy extraction, In those for operations on the air-passages and thorus, a novel trachectome, and a valvular canula. We may We may include with these various forms of inhalers for the ad ministration of medicinal vapours, stethoscopes of novel construction, and instruments for measuring the capacity of the chest, amongst which will be found Dr. Hutchin spirometer, Coxeter's portable spirometer, and Quain's stethometer. In those for operations, or other surgical ministrations, on the abdominal scalls or olimentary canal, we may mention some improvements in the gullet forcers and in esophageal tubes; modifications of the stomachpump, which are calculated to facilitate its use: enema fountains; specula of different kinds for the examination of the rectum, or subservient to operations on the part; and a large assortment of trusses and herniary bandages, including most of those in use, and others of navel construction, especially such as those by which the wearer can vary at pleasure the force of the spring and the direction of the pad.

[CLASS XC.

In these for operations as the proteonings spates a, the make, as the all the roots modelization of the indum, the final all the roots modelization of the interm of the make and the spates are the system arrowing, the spates of the spates of the system arrowing, the including contrivence for the use of the system arrowing, including contrivence for the spates of the proteoning of the systems of the spates from the bladder and methods which a form of from the bladder and method without conting to the from the bladder and method without conting and, butly, which is the spates of the spates of the spates of the spates of the spates continued in the spates of the sp

In those for operations on the grait-variancy system in the fromle, we have a large assortment of specula, dilators, syringes, forceps for removing polypi, instruments for applying lightures, pessaries, and artificial supports of various kinds; an instrument for the cure of vesico-vaginal fituids; and different instruments for obstetrical purposes. In those for operations on the extremities, we find, in

comercion with come varieties in the batter and, saw used for amputations, several noticeples modifications in the form and adaptation of tourniquets; for the adjusment and evaluation of freatures, unaccore continuaciation structure in the way of fracture-best, inclined with a movember of the several continuation of the with a movember deligit to sensible the policies to six up in bed, an apparatus for a firsterned circuit, together with poils and banalogies in different nativalus—for the reduction of dislocations several contrivuous, in one of the contribution of the contr

small extremity.

It those for operations on the osseous system, the estections of the osseous system, the circular as well as the circular saw of MACHELL, and, in addition to various instruments for the resection of bone, one will be

found for dividing and extracting lengthened sequestra. We noticed also a trephine-crown, which is made eapable

of expanding and contracting. In those for operations on the coscular system, we find some variations of the scarificators for cupping, improved leech-tubes, and artificial leeches;-for the control of hemorrhage, new forms of tourniquet; -instruments for transfusion; -- for angurism, various instruments for holding needles and applying ligatures, and instruments subservient to the new method of cure hy graduated compression;—and for varices, elastic stockings and

bandages. Besides all these praiseworthy attempts to improve and extend the ministrations of the surgeon, we observe that great attention has been paid to orthopardic processes for the removal of deformities produced by weakness, misgruwth, or habitual position, in the form of spinal supports, corsets, chairs, and a system of machines exhihited by Mr. Caplin for combining gymnastic exercises

with orthopædic objects.

In the mechanical compensation of lost parts great success has been obtained, as will be seen in examining the and legs. Among the arms, the apparatus and tools con-trived by Major Lettle to meet the loss of the right hand, is well worthy of inspection; and among the con-trivances for supplying the loss of the lower limb, the admirable mechanism of Mr. B. F. PALMER's artificial leg (United States, No. 39, p. 1435) deserves particular

In addition to the above list, the Jury may be per-mitted to draw attention to CHAPMAN's invalid couch (No. 601c, p. 476), Dr. VEITCH's invention, "denominated the medico-chirurgical amhalance" (No. 6, p. 407); and

Gowing's instruments of veterinary surgery (p. 475°) The Jury cannot, indeed, presend to have noticed in this report every article worthy of the surgeou's attention, or to have mentioued all the names of exhibitors whose merits deserve a permanent record. This remark applies, perhaps, in the greatest degree, to the exhibitors of col-lections of instruments, several of which, such as those lections of instruments, several of which, such as those Of Chananiaes (No. 145, p. 1233), COASTRAK (No. 422, p. 4697). ÉTANS (No. 274, p. 38), Finothosi (No. 638, p. 477, 478), LERA (No. 233, p. 1240). Finite and WHICKER (No. 641, p. 4657). SUPPON (No. 642, p. 4657) and Waise (No. 634, p. 4657). SUPPON (No. 642, p. 4657) and Waise (No. 631a, p. 478), form a complete and instructive epitome of the instrument-maker's art. In cond-inding this account of the angiest limit ruments. contained in the Exhibition, the Jury have to acknowsige the valuable assistance they have derived from Mr. PHILP; and to regret that, in consequence of his office as Juror, the house of Phill and Whickes (No. 641, p. 465*) have renounced all competition in the award of prizes. The Jnry deem it, however, no more than just to remark that the home of Saviony, of which

Messra. Philip and Whicken are the representatives, embraces the history of the manufactory of surgical instruments in this country for a period of scarcely less than two centuries; and that the late Mr. Savigny, as is shown by his well-kunwn work on the subject, was in his day almost the sole improver of instruments, which up to that time had been of a very rude construction. They desire to add that Mr. Philp has been practically engaged during the last fifty years in the manufacture of the justly-prized instruments, for which Savigny's firm has been celebrated, and that on the present occasion Messrs. PRILE and WHICKES, in the complete and excellent collection of instruments which they exhibit, have efficiently sustained the high reputation of their long-established

Thus in the Great Exhibition will be found the complete armonry and equipment of a surgeon, comprising a choice assortment of all the instrumental aids, in their most perfect form and finish, with which the ingennity of the artist or artificer can furnish the operator or the | of the objects they exhibit.

patient, for the relief of the manifold ills of suffering humanity,—as far, at least, as their remedy depends upon mechanical skill and contrivance. To attempt any critical examination of this admirable collection would be, however, in the opinion of the Jury, as hopeless as it would be invidious. The Jury appointed to report on surgical instruments could not, consistently with the abjects and limits of this Report, cuter upon the disenssion of subjects which involve references to a large portion of the surgical records and literature of the last half-century; and they have no wish to make their leport the vehicle of advertisement, or to reader it the occasion of contraversy. They do not arrogate to them-selves any judicial authority to decide on the claims of inventors, or on the comparative merits of improvers They have endeavoured conscientiously, as far as their means of judgment have extended, to award prizes in those cases in which the objects exhibited display inventive talent, useful ingenuity, or superior mechanical skill; and if in some instances they may have left talent unrewarded, either from the imperfection of their indement, or from the impossibility of acknowledging every degree of merit, they desire to record most unequivocally their sense of the general excellence manifested both in the contrivance and execution of the surgical instruments exhibited.

To the same Jury has been intrusted the duty of examining and reporting on the models of anatomy. Of these some beautiful examples have been exhibited by Auzoux (No. 13, p. 1170), Simpson (No. 641, p. 465* Town: (No. 625, p. 477), and Gordon (No. 639, p. 465°). The opinion which the Jury cutertains of their merits they have expressed, by awarding to each of these con-tributors the Prize Medal. And willst saying that such models are admirably calculated to aid the teacher in his demonstrations, the Jury, without detracting from their merit, may be permitted to observe that, especially in respect of human anatomy, they can never supply the place of actual dissection. They cannot, however, omit this opportunity of recording their apprubation of the value of the labours of M. Auzoux, who, in respect of the durability of the material he employs, and of the scientific exactness of the structures he displays in the auntomy of man, and in that of various well-chosen examples of animals, both vertebrate and invertebrate, has earned the gratitude of teachers of austomy and zoology. And they desire especially to express admiration of the series of models in wax, which display the anatomy of the torpedo, not only as highly-interesting specimens of Florentine art, but as patterns of scientific accuracy and artistic beaut

inally, in accordance with the philanthropic designs of His Royal Highness the Prince Albert, and of those who have promoted, under the Hoyal sanction, this great national undertaking, the Jury beg to express their sincere wish that the department of the Great Exhibition, on which they report, may contribute to produce that interchange of knowledge and of annity which this assemblage from all parts of the world is calculated to foster, and which it is alike the interest and the duty of all natious, as integral parts of the human family, to cheriah and to cultivate.

In making the following awards, the Jury intrusted with

this delicate and difficult duty, desire to say, that is con-formity with the directions of the Royal Commissioners. and without the means of marking degrees of merit, they have been under the necessity of avoiding a regard to comparative excellence. Also, that as they do not intend it to be understood, that others than those included in the prize list might not have properly received some testimonial of merit, so they trust, that the Exhibitors distinguished by the recommendation of the Jury will severally accept the prize awarded to them, not as a measure of their merit, but as a tribute to the excellence

PRIZE MEDALS.

NATION.	Number in Catalogue.	Name of Exception.	Orderts Rewarded,

CLASS XI.

REPORT ON COTTON MANUFACTURES.

[The figures after the Names (hetween parenthenes) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLESTRATED CATALOGUE.]

Sir James Anderson, Lord Provost of Glisgow, Chairmon, Glasgow; Cotton Manufacturer. PHILIP ELLINSS, Diputy Chairmon, Frankfort-on-the-Malne; Merchant. THOMAS ASIRON, Reporter, Hyde, new Manchester; Cotton Spinner.

C. Beschen, Austria; Vice-President of the Austrian Committee. Col. R. E. Cour, United States; Planter. W. Gray, Mayor of Boiton, Wheatfield, Bolton; Cotton Spinner, Gronge Jacason, Corporation Road, Carlisle; Cotton Spinner.

PAUL KIRCHHOPER, Switzerland, Avg. Minizer, France; President of General Council of Manufactures. J. Astinal Tunez, Manchester; Cotton Spinner.

Associates,

TROMAS COATH, 7 Bread Street, Chempide; Linen and Manchester Merchaut. Rosser Joneson, 95 Watling Street, City; Warchouseman. Joun Pitzuan, 11 Bos. Lane, Chempide; Mcrchant.

COTTON YARN,

Tire Jury appointed to examine cotton yarn and plain und coloured waven cotton cloths, have to report in vara, that the specimens from England, Scotland, Switzerland, the Zollverein, France, and Austria, which they have considered it necessary to notice, are those manufactured by machinery. In the numbers of usual production and use (say from 6s, to 250s.), they have found it impossible to do more than report upon the general character of the specimeus from the various countries, any superiority appearing to arise, not from greater skill in working, or superior mechanical appliances, but from the character

of the cotton used. Cheapness is the only other quality for which they could have made special mention; but they have found it impossible to arrive at any satisfactory results on this point, and have hence deemed it advisable to award no

medals. The yarns exhibited from England and Scotland are chiefly of second qualities, suitable for use in the trade,

chiefly of second qualities, suitable for nee in the trade, which supplies clothing to so large a portion of the wark-ing population of all parts of the world. Swiss yarms, exhibited by eleven different spinners, are of very beautiful quality, and are adapted to the pro-duction of those cloths in which softness of texture and besuty of dye are required; great attention has been successfully paid to the selection and preparation of the

The specimens from France possess similar qualities, whilst those of the Zollverein are of various kinds; but are not in sufficient quantity to illustrate fully, the trade

are not in sufficient quantity to illustrate fuzzy, the truce of the contribes in that usion. In fine yarms, Merser, T, Hortzinswortzs and Co., of Manchester (p. 452); Messer, Garnesus and Bazzary, of Manchester (p. 279); and M, Malakry, of the firm of Varyarortzs and Malakry, of the firm of Varyarortzs and Malakry, of the file (p. 1213), laxe each exhibited yars of No. 600s.; in the first and the stelling, and in the second instance made into 9-curd sewing thread, believed to be the finest ever yet produced. Messrs. T. Houlds-worth and Co. also exhibit small specimens of various degrees of fineness to 215%, and Messrs. Gardner and Bazley to 2070s.; but it does not appear that they are

produced in sufficient quantity to be of any utility.

Various specimens of yarus of hand-production are ex-

hibited from India-(curious on account of the shortness anotten trom findin-currious on account of the shortness of the filter of the cotton, and the fineness of the yarn produced), from Malta, and from Tarkey. All these yarus have that peculiar excellence of softness and pliability never yet attained by muchinery, but are very uneven and irregular in thickness.

DYED YARNS,

In dyed yarns, with the exception of the Turkey red shown by LEUMANN BROTHERS, Mattwiel, Switzerland, snown by LEXEAN EMPIRES, Natures, Switterland, (p. 1274), the speciment exhibited by Great Britain, the Zollverein, Switzerland, Belgium, and Austria, do not merit especial mention; good Turkey red and other fancy colours being produced in each country.

THREAD, &c. In thread there are few specimens exhibited from foreign countries,

CALICOS, &c.

In plain calicos the specimens of English mannfacture show how successful the efforts to produce good articles of general utility have been. The colour and finish of the blenched goods are very superior, It is, however, unfortunate that the manufacture, which forms a very large portion of both our export and home trade, should have been so imperfectly represented, that

many of its most important varieties are entirely wanting in the Exhibition, From the United States there is a good selection of

drillings, grey sheetings, and jeans of excellent quality; and from Belgium and France a few specimens only of plain grey and white calicos, made, however, of cotton

plain grey and wrate cascos, misor, sowers, and measurably fine for the purpose. Specimens of white calico, prepared according to the putant of Mracux (p. 556), of Accrington, Laucashire, are exhibited, possessing the increased thickness resulting are within the contraction. from this process; but as this invention is more import ant in dyed or printed goods, the Jury connected with that Class will report fully upon it. This Jury would, however, add, that, as far as the specimens canble them to judge, it promises to be a most valuable discovery when applied to bleached cotton cloth.

The Jury regret that no specimens of cords and beaver-

teens were exhibited, or of the very important article of

MUSLINS, &c.

Very good specimens of muslins (tarlatan, hook, mull. lawn, &c.) are exhibited from Glasguw, Switzerland, and France, and of jacconot and cambric muslin from Manchester and Saxony. The British goods are suitable for the Indian and American, as well as the home markets. The plain muslins exhibited by native merchants of Dacca have great merit, especially when the rude mode of pro-duction is considered; but their cost is relatively high, and the finish universally defective; the yara too is uneven, and frequently overtwisted. In figured harness muslins, Scotland, Saxony, Switzerland, and France, exhibit articles of considerable beauty

and utility, at comparatively low cost. COLOURED WOVEN COTTONS.

In ginghams, the large exhibition from Glasgow. Carlisle, France, Switzerfand, the Zollverein, and Belgium, shows that the manufacture of these ascful articles has received great attention, and attained great perfection in

all those countries. An interesting collection of woven checked goods is exhibited from India and the Archipelago, many of them being the originals from which the European manufactures

(nuw much superior) have been copied. In the class of goods submitted to their inspection, although many of them are of very great excellence, and evince the application of great skill, taste, and industry in their production, the Jury have found nothing possessing the contract of the contra ing the pre-eminent merit which would induce them to ing the pre-eminent merit water would induce them to recommend the award of a Conneil Medal. In the perform-ance of their duties they have endeavoured to avoid making any invidious distinctions, or using any expres-

sious which might tend to injure the interests or the feelings of the exhibitors. The Jury award Prize Medals to the following Exhi-

AMOSKEAG MANUFACTURING COMPANY, New Hampshire, United States (2, United States, p. 1433), for a very good assortment of drillings, tickings, sheetings, and

cotton flannel. Andraeco, Tobic, Wattwyl, Switzerland (111, Switzerland, p. 1293), for cambric muslin made of unusually fine yaru

Andreson, D. and J., Glasgow (16, Class XI., p. 481), for a good general assortment of ginghams.

Baoog, Jonas, and Baothers, Huddersfield (24, Class Xf., p. 481), for their 2 to 9-cord thread, for its superior smoothness, strength, and freedom from fibre.

CHRISTY and Sons, Fulrfield, near Mauchester (44, Class XI., p. 481-82), for their improved manufacture of the Turkish bath towel, DAUDVILLE, ALPHONSE, St. Quentin, France (156, France, p. 1178), for excellence of manufacture in harness

windus eutrains and in harness piece muslins.

DE BAST, CAMILLE, Ghent, Helgrim (189, Belgrum, p. 1157), for beautiful grey calicos made of very fine cotton.

DUBLAN, DELESPALL, Robbaix, France (148, France,

p. 1178), for cotton trouserings of excellent taste and DUBANTON, J. B., Paris (494, France, p. 1201), for shirt fronts, produced by the Icom in imitation of needle-

FEIR, J. C., St. Gall, Switzerland (122, Switzerland,

p. 1274), for columned Jacquard muslims. FEBOUELLE and ROLLAND, Paris (200, France, p. 1183), for novelty of design and beauty of manufacture in coloored figured muslin

FINLATSON, F., and Co., Glasgow (S. Class XI., p. 480), for beauty of design and superiority of execution in fastcoloured sprigged lappets. GARDNER and BAZLEY, Manchester (53, Class, XI.,

p. 482), for fine yarus. HARTMANN and Son, Munster, France (256, France p. 1189), for brillantes, or figured cottons, of excellent make and assortment.

HORNOCKSER, MILLER, and Co., Preston (60, Class XI., p. 482), for the superior make and bleuch of their shirt-

HOULDSWORTS, T., and Co., Manchester (54. Class XI., p. 482), for fine yarns Journson, Januz, Manchester (48, Class XI., p. 482), for coloured quiltings and toilet covers, of excellent manu-

JUURDAIN, X., Altkireh, France (1631, France, 1255), for muslin made by power of 190s, warp and 250s, weeth

LAMBERTS, A. CHRIST., Son, Gindbach (604, Prussi p. 1084), for cotton kalmneks and beavers, as an improved manufacture of general utility.

Lano, J., Vienna (185, Austria, p. 1017), for gingham the quality and design of which are suited to French and German taste.

LEUMANN, BROTHERS, Mattwicl, in Switzerland (130, Switzerland, p. 1274), for specimens of Turkey red, of great brilliancy and force of colour. The award is made irrespective of the cost of this yarn. Lisnon Weaving Confant, Portugal (707 to 712, Portugal, p. 1315), for specimens of blankets and shawis of cotton, a manufacture apparently peculiar to that country.

M'BRIDE and Co., Glasgow (6, Class XI., p. 480), for cotton diaper for table cloths and towelling woven by

power, MAIR, J., Son, and Co., Glasgow (59, Class XI., p. 482), for beauty of design and execution in window-curtain produced at a reduced cost by a new arrangement of the Jacquard loom.

Majon and Gill. Manchester (49, Chass XI., p. 482). for double contils and nankeens for corsets produced in the loom

MALLET, -, of the firm of Vantroyen and Mallet, Lille, France (715, France, p. 1213), for fine yarns, Martin, W. and Son, Bolton (37, Class XI., p. 481), for very superior farniture dimities MYERSCOUGH, STERLE, and Co., Bolton (39, Class XI.,

481), for excellence of design and workmanship in toilet quilts and bed covers. NASF, MATTHIAS, Niederurwyl, Switzerland (131, Switzerland, p. 1274), for the hrightness of colour and good assortment of levantines.

NEF, J. J., Herisau, Switzerland (198, Switzerland, p. 1279), for white spotted muslins, Ourseaser, the Company of, (Peigné Delacourt, Ma-

nager), France (379, France, p. 1195), for bleached mada-poliams, of excellent quality and superior roundness of OWTRAM, R., and Co., London (62, Class XI., p. 483),

for figured and checked cambries of very superior manu-PANSA and HAUSCHILD, Chemnitz, Saxony (42, Saxony, p. 1106), for 4-thread knittings and good general assort-

PATTERSON, JAMESON, and Co., Glasgow (ff, Class XI., p. 480), for imitation of Madras handkerchiefs of

fast colours. RANSAUER ARBLY, Herisan, Switzerland, for very per-fect specimens of tarlatan and book muslin. RASCHLE and Co., Wattwyl, Switzerland (168, Switzerland, p. 1277), for imitation Madras handkerchiefs, of fast colours; those with hlue grounds being especially

Symingron, H. H. and Co., Glasgow (14, Class XI., p. 480), for licenty and appropriateness of design and excellence of manufacture of harness window curtains. TANNER and KOLLER, Herisau, Switzerland (206, Switzerland, p. 1279), for scarf, shawl, and dresses with flounces, produced by an improved adaptation of machi-nery, and for beauty of design. Medal awarded in

Class XIX. THUMER and TÖFFFER, Chemnitz, Saxony (90, Saxony, p. 1109), for two coloured cotton table-cloths, of good

design, Torson and Sons, Huddersfield (116, Classes XII, and XV., p. 490), for vestings of great beauty of design and superiority of manufacture. Medal awarded in Class XII, Vocat and Carner, Gern, Saxony (711, Zollverein,

p. 1089), for the cheapness and good quality of their levantines.

for very useful and good wasstcoatings relatively to their

cost,
WILLIMENTIC DUCK MANUFACTURING COMPANY, Connecticut, United States (352, United States, p. 1457), for
a specimen of cotton sail-cloth of very superior strength

and evenness.

And also of the following manufacturers for very good assortments of ginghams and striped and checked goods, These are all useful, being suited to various markets, and

and evenness.

The Jury make Honourable Mention of:—
CLARER, J. P., Leicester (32, Class XI., p. 481), for
the great taste and ingensity shown in winding and
making up the specimens exhibited by bim.

Wender, J. J., Ludwigsburg (29, Wortemburg, p. 1115), all valuable as cheap productions; and the Jury have revry useful and good wasteoutings relatively to their found little difference in their relative merits:—found little difference in their r

CLASS XII.

REPORT ON WOOLLEN AND WORSTED MANUFACTURES.

(The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND RESISTRATED CATALOGUE.

Jury.

Dr. Vox Игалилах, Сетенов, Munich; Privy Councillor in Finance Department, Пихак Fonnas, J. P., Върнер-Cheirmen, Bradbord; Merchant, Запул. Арпългом, Веренов, Ida St. Martin's Lane; Weollen Merchant, Hasar Barry, Wood Street, Chenpide; Woollen Merchant.

HEAST BRIFT, Wolds every, a request; in some accusant. C. C. Cani, Zoliverin; Manufacturer, version and Manufacturer. Joins Cooren, J. P., Leeds; Wesilten Merchant and Manufacturer. Grome Lawtox, Meckleburst, near Authon-under-Lyue; Flannel Manufacturer.

Groung Lawyos, Meckelmark, near Ashon-under-Lydo; Financi Manufacturer. Thomas Mannaso, Strond; Retired Manufacturer. J. Randonso, France; Member of Central Jury, &c.; Member of the Legislative Assembly of France, AON SAMOLLOFF, Russia; President of the Council of Manufactures at Moscow.

ARM, Simonis, Belgium; Merchant; President of the Chamber of Commerce, Verylers.

Associates.

Jons Basses, Leeds; Salesman JUNETH BATESON, Leeds: Merchant.
THOMAS DEWINER, Bradford; Worsted Spinner.
BENZAMIA HARRISON, BENJOYCH; Worsted Manufacturer.

GROBGE TETLEY, Bradford; Merchant. * F. Levius, Proxy for M. Carl. † C. Dyyernans, Proxy for M. Schöller.

THE Jury appointed to decide on the merits of the various examples of Woollen and Worsted Fabrics, found it requigrampies or recommand worster rances, found it requi-site to divide their duties, and to constitute four Sub-Juries for the consideration of the several subjects demanding their attention; the Report will therefore be found to present four general heads, vis., Woollen Cloths; Flannels and Blankets; Worsted and Mined Fabrics; and

pelled to call in much additional assistance, and they In the course of their labours, the Jury were comave to acknowledge the valuable aid afforded them by the several Associate Jarors in simplifying daties of no ordinary character, since the great mass of articles coming under their cognizance rendered those duties as onerons as the responsibility was serious, owing to the great similarity and equality of merit displayed in almost every department.

In presenting their nwards without recomm Conneil Medal, the Jury consider it only due to the important branches of industry represented in Class XIL, to state their conviction that in no point can they consider them as unworthy of the highest recognition which the Jury had the power to give or recommend; but feeling, from the great amount of merit displayed, that the recommendation of a Council Medal " for excellence of manufacture, beauty of design, or progress" is any one instance, would have involved the same recommendation in so many others, as utterly to destroy the value of that reward, besides erenting those invidious distinctions which the recognition of various degrees of the same kind of merit must suggest, the Jury determined to equalize such meth must suggest, the suly determined to equalize som acknowledgments of excellence by awarding the Prize Medal only; leaving to the public, as the best arbitrators, the decisions on question of relative degrees.

WOOLLEN CLOTHS.

Before proceeding to report upon the articles contributed by the several Enhibitors, the Jury consider it desirable to give some short account of certain differences of manufacturing treatment between our home produc-

what is called the roll-follog process, which produces a permanent lastre on the face of the eloth, that neither spots by rain, nor is removed by daunt. This process was introduced by Messrs. Daniell and Wilkins, of Twer-

HENRY JENNINS, Leeds; Merchant. HENRY KERARIE, Rochdule; Plannel Manofacturer. DARNINS LUPTON, Leeds; Woollen Merchant. ENGLES PARLIES, Bradford; Merchant.

ton, near light, who took out a patent for it in the above year. The permanent face is imparted by rolling the cloth, before being racked or tentered, round a cylinder, not very tightly, and putting it in scalding water for two or three hours, then taking it out and letting it cool; this has to be done several times during the process of dressing. About the same period great improvements were made in the milling and weaving departments, which enabled the cloth to bear this severe test. Other manufeaturers had to poy a premium to the above-named firm for three years, when the patent was disputed, and ulti-mately lost through the evidence of a Yorkshire manu-facturer, who proved that he had used it several years acturer, who proves that he had used it several years before; but, owing to his connection being very limited, it did not asswer his purpose to continue it. However, the credit must remain to Messrs, Daniell and Co. for the perfection and general introduction of a plan which has since been universally acted upon.

Up to this time the general plan had been to dye blacks Cy to this time the general plan had been to dye black; as in the piece, of a common day; In this new meltod was in the piece, of a common day; In this new meltod was found difficult to make the day presente through the improved finding; this led to the gradual introduction of daying in the word of a permanent kind,—a process which, of the common daying in the word of a permanent kind,—a process which, the common daying in the word of a permanent kind,—a process which, the common daying the day in the word of a permanent kind,—a process which is now to perfect at as the level little or aching to be desired. While speaking of the improvement in woodless manufacture, it is but justifies to mention the introduction, by Mesers, Daniell and Wilkins, of a new method of weaving stout beaver cloth for winter went, called the "patent double cloth," which was patented by them in 1838, the material possessing considerable secrit for its soft phable character, united with great durability, enusing it to entirely supersede the old milled cloth, which was hard and macomfortable. By this straint to give some siner account our events numer excess manufacturing treatment between our home produc-manufacturing treatment between our home produc-ms and those of the Continent. In Executary in new era for this trule may be said to in Executary in new era for this trule may be said to have commenced, in the year 1824, by the introduction of travelling was unknown, and the requirement more felt, This kind of cloth has a good sale, and is much sought after by foreigners, who require the stoater kind of fabrics.

The centinental suchois of probeing a permanent into a continental suchois of probeing a permanent into such a continent and a continent at a mate charge rate. Their matches are,—the one by relike the chit sightly read more general one, by fishing the chit and parting it mitroduced on protein the sixther effect, the other, and more general one, by fishing the chit and parting it is necessary to the charge of the chit and parting it is necessary which is observable as all the evaluational properties the whole balls. Both them entrols causes a lauritous, which is observable as all the evaluation of the chit of th

Considerable attention has been given to the dyving of cloth in the different countries; opecially the fare fabrics, which are all equally well and permanently dyvel. In the middle qualifies some any permanently dyvel and lower qualifies with some few exceptions; they are all of a common dyc. This is a ricromassness easily accounted for by the cost of the permanent dyc being considerably move, and from the chartening slightly from the appearment of the cost of the permanent dyc being considerably move, and from the chartening slightly from the appearnent permanent dyclamates and the considerably move are great impediments in those competitive times, although there can be no destit that real and ublimate economy.

must remain with a permanently dyed stricle.

We shall now proceed to enumerate the different sents of manufactures from which this department of the Exhibition has been supplied,

The weeklen menufactores of the West Riding of Yorksbire, and those of the West of England, were established in the reign of Edward the Third, in the year 1336; and from that period to the present time, the principal weeklen trade of Great Britain has been located in these two imp-rtant districts.

Leeds is the most important town in England for the extent and variety of its manufactures in wool, and exhibits here a fair specimen of its productions; but its principal trade is in the middle and lower qualities, of which a large amount are exported.

The bounds of Leeks, which, seconding to the census of the precent year, centries as positions of 11,360 of the precent year, centries as positions of 11,360 are strongly in the central properties of the properties of strongly in the central properties of the properties of the central properties of the central properties of the central properties of the central properties of the supply central properties of the central properties of the central properties that of our of the central properties of the central properties that of our of the central properties of the central properties that of our of the central properties of the central properties that of our of the central properties of t

Much attention has, of late, been devoted to perfecting the woollen unanufacture in all its hrameloss. It is probable that the opportunity afforded to our local manufacturers of seeing the various productions of other manufacturers of seeing the various productions of other materials in the Great Exhibition, will materially assist in effecting this object.

Holdenfield, with its neighbourhood, is the second place in Importance for the quantity and great variety of woollen cluths which it produces. Here, an immense portion of the funcy trunscrings are made, beides broadcluties, but the productions of this town are principally for home consumption, and of the middle and lower qualities. This town, in 1520, made goods from homegrown wood only, but since that period it has gradually rises into great importance. The manufactures of this megidaturinos challed in great variety of fibrire which fairly represent their prolinets; among these may be reduced a number of cloubs-freed cloths, presenting a modern a number of cloubs-freed cloths, presenting a modern and the cloth of the cloth

Where or Emilann—Strond, or Strondwister, Gloscotershire, is so sailed for the purity of its saster, which have been in repaire for dyving scaletes and light dyes for contarior. This town and neighborhood, with 1264 gr great sents of manufacture in the West, principally for fine broad-cloths. They exhibit great variety, in colours of the finest character and permanent day, but few in repard competentiage the react object of the Eshibition, which they imagined to be for the display of goods of a pre-unional character, rather than for variety of

production. Trowbridge, Wiltshire, is the next town and neighbourhood of importance in the West, exhibiting principally narrow or trouser goods of the finest quality and permanent dye.

Chippenham, Melksham, and Bradford, Wilts, also

chibit a variety of very choice and fine permanent dye, in black and coloured cloths. Frome, Somersetshire, and Twerton, near Bath, exhibit likewise some beautiful specimens of cloths, beaver, and

likewise some beautiful specimens of cloths, beaver, and Venetians.

Scottasto.—Galashiels, Aberdeen, Selkirk, Hawick, and other places exhibit a great variety of fabrics in trouser goods, of a beautiful soft character and permanent

dye.

BELEND.—Mr. J. REID, of Dublin, exhibits a good variety of frieses, and 4-tweeds of considerable merit, particularly deserving of encouragement, as a fair specimen of the products of that country.

ment of the procurses or some consury.

PRANCE—The principal seats of this manufacture in Prance are Sedan and Elbernfi—Sedan, of blacks, broads, and surrows. Sedan exhibits a clone and beautiful this fibric in these articles, all dyed in the piece, but the fibric in the articles, all dyed in the piece, but beautiful variety of face of the season a great not beautiful variety of face; of being shown a great and beautiful variety of face; of being shown a great and beautiful variety of face; of being shown a great and beautiful variety of face; of being shown as a surrow of the season and the season and the season and the season are season as a surrow of recolor activities of considerable merit.

a BLEGHER.—Verview and its neighborhood are the principal set of munificators for woollens in this country. The value of mannfactured goods is about one million sterling per annum (population 24,000), the markets for which are the interior of the country, Holland, Switzerland, Italy, and Auserica. The manufacturers of this country exhibit a small quantity, but a nice cluster of a thin factor.

Cutting to a com more.

ZOLLYZEIN,—The Zollverein, including Saxony, exhibit an iumenue quantity of woollen goods, from a great number of places and munufactories, chiefly of the middle and lower qualities, though several are of a fine character, all very well manufactured and of considerable merit. The chief market for these coods is American.

ACTIMA.—Brunn is the chief seat of manufacture in this country. The products exhibited are without any face, or are of what we should call the "old make;" but this appears to be the fashion in Vicena: in other respects they are of a good character. Reicheoberg, in Bobenia, also exhibits a variety of middle and lower qualities of considerable merit, dressed after the German plan.

Russia exhibits a small quantity of woollen fabrics of good character, prepared after the German plan; and being of a stout make, they exemplify what the Jury previously stated of the hardness produced by that method.

SPAIN has sent a small variety of woollens; some of these made of wool from their own sheep, others from the fiecce of German sheep, which is much superior—a singular fact, as the Germans formerly imported their sheep from Spain.

AMERICA exhibits a small quantity of woollen goods of SWITZERLAND sends a small and indifferent lot of woollen productions.

TUBERT forwards a small assortment, tolerably good for a first attempt

Holland contributes a few coarse woollens. PORTUGAL exhibits a pretty good variety, but of very primitive character

Canapa shows but few woollen goods, SOUTH AUSTRALIA. - From Sydney are exhibited three pieces of 2-tweeds, manufactured by J. Walake, which

deserve great praise, as coming from a young colony, and certainly show that with a few such men, aided by capital and machinery, the colonies might soon be made to produce many of their absolute necessaries of this description, Three exhibitors and manufacturers of woollen cloths

are members of this Jury, and are therefore not strictly within their cognizance, or eligible for any award. The Jury, however, desire to record their opinion of the goods exhibited by them. These exhibitors are:—
COOPER, D. and J., of Leeds. (42, Classes XII, and

XV., p. 486.) RANDOING, J., Abbeville, France. (No. 973, France. p. 1226.) The principal of one of the oldest establishments for the manufacture of wootlen cloths in that country.

Stmonis, E., Belgium (464, Belgium, p. 1166),-who resents a particularly beautiful assortment of piece-dyed blacks for exportation, of permanent dye and finish Each of these gentlemen would have been entitled to a Prize Medal for the excellence of his productions, had he not been a member of the Jury.

The Jury have carefully examined all the woollen goods in the Exhibition -- a task which has been much prolonged by the non-attendance, in due time, of any Juror from the Zollverein, Russia, or Austria, to explain or give informa-tion as to prices. This was a source of great difficulty; but after a long and patient investigation, the Jury have come to the resolution to award Prize Medals to the following manufacturers and exhibitors:

AKSENOTE, J., Klintz, Government of Tshernigoff. (182, Russia, p. 1372.) For excellence of manufacture and finish APPERLY, J. and D., Strond, for the fine specimens of black cloth exhibited by Messrs, Bell. and Wilson, St. Martin's Lane (12, Classes XII, and XV., p. 486). Jury conceive that the merit of the production is doe to the manufacturer, and not to the exhibitor, and therefore award the Medal to Messrs, J, and D. AFPERLEY, whose

award in cateda to refeste, 5 and 5 Arrandas, whose mines appear on the cloth.

ABSITATOR BOOTHERS, Manufacturers, Huddeesfield, (105, Classes XII, and XV., p. 469.) For excellence of manufacture, combined with economy.

Arronara Coornav, Huddersfield. (276, Classes XII, and XV., p. 596; Exhibited through Lewis and Allenby). The common for the common forms of the common forms of the common forms of the common forms of the common forms.

Bacot, Paul, & Sons, Sédan. (1062, France, p. 1229.) For excellence of manufacture in fancy black and satin doeskins, and fine piece-dyed black cloths of a thin make,

of permanent dye and finish.

Banktoor and Huser, Manufacturers, Huddersfield.
(105, Classes X11, and XV., p. 489.) For great excellence of manufacture BEARDSELL, ISAAC, and Co., Manufacturers, Thoughridge, near Huddersfield. (109, Classes XII. and XV

pp. 489, 490,) For excellence of manufacture, with great beauty of design. Beardseas, C., and Co., Manufacturers, Holmchridge,

(120, Classes XII. and XV., p. 490.) For beauty of mano-BENNETT, J. and A., Bradley Mills, near Huddersfield.

(95, Classes XII, and XV., p. 489.) For ingenuity in the application of new materials.

HENNHARD, W., Leisnig. (121, Saxony, p. 1110.) For general excellence of maturfacture.

HENNHARD, CHENNON, and Co., Sédan. (1082, France,

p. 1230.) For excellence of manufacture and beauty of design in fancy doeskius.

BIOLLEY, F., and Son, Verviers. (195, Belgium, p. 1157.) For superior manufacture in piece-dyed blacks of a thin fabric for exportation, of permanent dye and

BRAUN BROTHESS, Hersfeld, Hesse, (491, Prussia, p. 1079.) For excellence of manufacture. BROOKE, JOHN, and SONS, Manufacturers, Honley, near

Huddersfield, (86, Classes XII, and XV., p. 489.) For general excellence of manufacture, finish, and dye, Bnows, J. and H., and Co., Manufacturers, Selkirk, Scotland, (469, Classes XII, and XV., p. 501.) For general

excellence of manufacture, Cass, T. and W., Manufacturers, Twerton, near Bath, Somersetshire, (273, Class XII, and XV., p. 499.) For excellence of manufacture in fine cloths of permanent dye and finish, with beavers of a superior quality and con-

siderable novelty of production.

Chenneyear, Turopour, Elberd. (1559, France, p. 1251.) For extraordioary merit of manufacture and novelties of desigu, in great variety.

CLARK, J. and T., Manufacturers. Trowbridge, Wilsteine. (13, Classes XII, and XV., p. 486.) For excellence in manufacture, permanency of dye, and finish, in a variety of articles

Chombie, James, and Co., Manufacturers, Aberdeeu. (228, Classes XII, and XV., p. 497.) For superior manu-(228, Classes A11, new facture and beauty of design, and Soxs, Manufacturers

nature and leasily of design.

DAVIS, H. X., and SOSS, Manufacturers, Stonehouse
Mills, near Stroud, (14), Class XII. and XV., p. 496.)

For excellence of manufacture in fine scarlets.

Dicksoss and Larkson, Manufacturers, Hawick and
Glasgow, (23), Classes XII. and XV., p. 497.) For superior manufacture and extraordinary fine qualities.

DEROIS, G., and Co., Verview, (196), Berjann, p. 209.)

DEROIS, G., and Co., Verview, (196), Berjann, p. 209.)

For general excellence of manufacture in trouser goods,
For general excellence of manufacture in trouser goods,
Evens, William, and Sons, Leeds. (27, Classes XII,
and XV., p. 487.) For excellence of manufacture, with economy.

FIELDER, A. G., Upatovka, near Kalish. (351, Russia, p. 1383,) For excellence of manufacture and dye FORTIN-BOUTELLIER, Beanvais. (484, France, p. 1201,) For beautiful production of felt cloths for pianofortes. FORSTER, FR., Grueneberg, Silesia. (220, Pras p. 1060.) For excellent manufacture of Spanish stripes,

GEISSLER, C. S., Görbtz, Silesia, (100, Prussia, p. 1054.) For excellence of manufacture, and permanent dve and finish.

dye and nassn. GEVERS and SCHMIDT, Görlitz. (50, Prussis, p. 1050.) For excellence of manufacture, dye, and finish. Gort and Soxs, Manufacturers, Leedu. (47, Classes XII. and XV., pp. 487, 489.) For excellence of manufacture, in a great and beautiful variety of colours, for facture, in a great and beautiful variety of colours, for exportation

GRAY, SARUEL, Manufacturer, Calverly, Leeds. (67, Classes XII, and XV., p. 488.) For general excellence of GROSSMAN, C. G., Bischofswerda. (124, Saxony, b. 1110.) For excellence of manufacture, dye, and finish,

for exportation, HAS, L. F., and Sons, Bortscheid. (357, Prussin, p. 1071.) For general excellence of manofacture. HABERLAND, G. A., Finsterwalde. (99, Prussia,

p. 1054.) For general excellence of manufacture, Hacture, Cookx, and Wonnald, Dewsbery. (25, Classes XII, and XV., p. 487.) For excellent production of Spanish stripes HARGREAVE and NUSSEYS, Manufacturers, Farnley Low

Mills. (28, Classes X11, and XV., p. 487.) For general excellence of manufacture, and great ingenuity in the application of new materials, HELME, W., Manufacturer, New Mills, Strond, (207,

Classes XII. and XV., p. 496.) For very apperior black doeskins, with a very great variety of cass and cash-meretts, in a variety of beantiful and delicate colours. HENDRICHS, FRANCIS, Eupen, near Aix-ta-Chapelle. (367, Prussia, p. 1071.) For excellence of manufacture and finish.

HENRY, A. and S., and Co., Manufacturers, Leeds. (38, Classes XII, and XV., p. 487.) For excellence of manufacture, economy, and uniformity.

Hearmann, W., Leisnig. (139, Saxony, p. 1110.) For general excellence of maunfacture. Hoorea, C., and Co., Manufacturers, Eastington Mills,

near Strood. (210, Classes XII, and XV., p. 496.) For apperium merit in the manufacture of fine cloths of permanent dye and finish, and for great variety; also for a beautiful production of clastic cloths for gloring.

INGLES and Baown, Manufacturers, Galashiesis. (191, Classes XII, and XV., p. 495.) For general excellence of

manufacture and style.

Isatery, P., of Klintzon, Government of Tshernigoff.

(184 Burgle, p. 1372). For reveral excellence of manufacture and
184, Russia, p. 1372.) For general excellence of manufacture.

Mono Baothess, of Klagenfurt. (218, Austria,

p. 1018.) for the hearty of their colours.

WALKER, J., of Sydney. (23, p. 487.) For three pieces of tweeds, of great merit for so young a colony.

Wostern Start Goost.

The term "Western Start" is expelled to fabric under the term "Western Start" in expelled to fabric under the term "Western Start" in expelled to fabric under the term of the considered with cotton and silk. These fabric was a considered with contract the term of the term

of the Duke of Alva, in 1570, drove over a large number of Flemish refugees, to whom both the woollen and the Many settled in worsted trades were much indebted. Yorkshire, especially at Halifax, which was, for many years, the principal seat of the manufacture, and has always maintained its superiority in the production of damasks, lastings, and other heavy goods. The inventions of the spinning-jenny, the mule, the threstle, and other machinery, in the latter half of the last century, were gradually extended from the cotton to the worsted The first spinning machinery erected in Bradford was in 1790, when a few frames were set up in a private house. At this time the wool, after being combed, was carried into the villages to a considerable distance around, and there spun hy the hand-wheel; a primitive method, which was gradually superseded by the spinning-france. The first factory in Bendford was built in 1795; but it was not intil thirty years afterwards that the power-loom was introduced, and considerably later before its use became general. From the year 1825, the worsted manufacture has made most rapid and unprecedented progress. Up to that period, and for some years afterwards, all the goods were made from weol aboue; but about the year 1834, manufactures of worsted weft and cotton warp were first brought forward, and gave a great impetus to the trade, This was still further increased by the introduction, in 1836, of the wool of the alpaca, an animal of the flower tribe, inhabiting the mountain ranges of Peru. This weel is of various shades of black, white, grey, brown, &c., and is remarkable for brightness and lustre, great length of staple, and extreme softness. Considerable difficulties were at first experienced in the working of this material; but they were altimately overcome, and the alpaca manufacture now ranks as a very important hranch of the worsted trade. About the same time, or shortly afterwards, mohair, or gout's wool, from Asia Minor, was brought into general use in the West Kiding of Yorkshire, and many beautiful fahries were produced from it: silk, also, in combination with wool, alpaca, and mohair, has been largely used. Improved machinery has been devised; more rapid processes of manufacture adopted; and the results of all these improvements, and the introduction of these new materials have been-the opening of new branches of industry,-the quadrupling, within thirty years, the number of workpeople employed,-and the production of an immense variety of fabrics for the purposes of clothing and furniture.

poses of clothing and turniture.

The rapid progress of the trade may be illustrated by a reference to the town of Brailford, which is the centre of the manufacture, and the great market where its productions are disposed of. The population of the borough has increased in the following ratio, viz.,—

ln	1801	It was		-	-	13,264	
_	1811	12	-	-	-	16,012	
	1821		-	-	-	26,300

• We except of course bombasines and other articles manufactured in Norfolk, which come under the head of "Mixed Fabrica."

The following is a summary of the whole of the worsted factories in Great Britain and Ireland, nearly sevencighths of which belong to the West Hiding of Yorkshre.—See Table, p. 355.

The classification of worsted stuffs contained in the list drawn up for the Jurors has reference to the naterials of which they are composed; viz.—

with cottou or silk.

Fabrics composed entirely of wool,
 Dite of wool and cotton,
 Ditto of wool and islk.
 Ditto of wool, silk, and cotton,
 Ditto of spees and mohair, mixed

The first of these divisions comprises the well-known fabrics called "merius," double-twilled, so denominated from the Spanish wool of which they were first manufactured. In this article the French have always had an anquestionable superiority, and many of the specimens in the Exhibition fully maintain their reputation. There are some goods of this class, however, in the Bradford department, had little inferior to them. In single-twilled merimos, the worsted manufacturers of Yorkshire have. at all times, had the decided pre-emineuce. Shalloous says, serges, lastings, all stout and heavy articles, are manufactured cinety at Halifax and at Keighley. Da-masks for curtains and hangings are also made at Halifax; and this branch of the trade has arrived at great perfection, both in excellence of material and elegance of design. Of the fabrics composed of wool and coston, the articles denominated Cobourg and Orleans cloth, the former being twilled and the latter plain, have been st-ple manufactures, of which the consumption has been immense: they are made chiefly at Bradford and Keigh-ley. Many of the silk warp and worsted weft fabrics are distinguished by their richness and durability. The alpaca and mohair manufactures (carried on at Bradford and Bingley) are remarkable for their softness and brilliancy, and the great variety of purposes to which they are applicable. The importation of alpaca weol has inare applicable. The importation of alpaca wool has in-creased from 7,000 bales in 1836, to 20,000 bales in 1850; and of mohsir, from 5,621 bales in 1841, to 12,884 bales in 1850. It is in the production of articles in which wool of various kinds is combined with cotton and silk, that the superiority of the British manufacturer is most apparent; no such goods being produced on the Continent in any extent, or of any great excellence. This result could not have been attained had not the skill and enterprise of the manufacturer been nided by that of the worsted dyer. The chemical processes required, in order that a fabric composed of both vegetable and saimal substances may be made to receive an equal and regular dye, are neces-sarily varied and intricate; but so successful have been

the efforts of the dyers, that goods made of white cotton warp and worsted week, can be dyed quite as perfect in colour, as French merines composed of wool above. The cosmangious of these various namedicurus inrible commission of these various namedicurus inrible commission of the control of the colour interest in the colour interest in the colour interest in the 80,000 pieces per week, averaging 50 yards each. These goods are not only sold in the United Kingdom, but are largely experted, as the following returns will show, to the United States of America; and to Germany and other

parts of the continent of Europe.

Exports, during the six mouths from the 1st of January to 28th June, 1851:—

Woollen and worsted yarns, 5,567,854 lbs.

Woellen and worsted yarns, 5,367,854 lbs.
Woollens and cottons, mixed (value) £830,478.
Stuffs, woollen, and worsted do, £1,896,228.

All that is now wanting in the English worsted trade is, that the same enterprise should be exhibited, as heretofore, in the working-up of materials into new forms, combined with greater taste in the production of fancy

goods. The goods of this division, contained in the Exhibition, include a very large wariety of fabrics need for ladies' and châthreis dereses, for familiare hangings, for costings, and other purposes, made from well-place, and mohair, combed and span, either slone or in continuion with cotton, silk, see. The Jury have carefully and minestly examined all the fabrics hought under their

notice, and award Prize Medals to the following Exhi-

ASSOTD, JAMES, and Son, Manufacturers, Halifax, (130, Classes XII, and XV., p. 491.) The productions of this firm are eminently diversified and beautiful. The damasks are distinguished by elegance of design, richness of colour, and superiority of weaving. The "union damasks," composed of worsted and cotton, are noticeable also for economy of production. The satin Turc goods have a regularity, which shows that all possible eare has been bestowed on their production. Some fabrics, cutilled "Moires d'Exposition," are remarkable for their povelty and the brilliancy of their effect. The articles made with silk warp and China grass are very beautiful. The patterns, colours, and combination of materials, are alike deserving of praise. The ponchos are well made and adapted for the markets of South

Burray and Sox, Manufacturers, 102, Rue Richelien (356, France, p. 1194.) For cashmere fabrics of Paris. (1996, France, p. 1997). The great finences and regularity.
Borronter, Mossa, and Son, Shelf, Bradford. (165, Classes XII, and XV., p. 499-4.) The goods shown by this firm are woven with great regularity, and the designs

of the figured fabrics are good, BOUCHEZ-POTHIER. (34, France, p. 1173.) For merinos of excellent manufacture,

Brown, W., Manufacturer, Halifax. (129, Classes XII, and XV., p. 490.) For damasks composed of com-binations of wool, silk, and cotton. Great taste is dis-Dinations of wool, silk, and cotton, terest taste is dis-played in the designe; and in brilliancy of effect, and per-fection of manufacture, the goods approach very cearly to those exhibited by Messra, Akroyd.

Batus and Natura, Manufacturers, Gera. (816, Parasla, p. 1095.) For cloths made with worsted weft and

silk warp, well woven and dyed.

CAILLET-FRANQUEVILLE, Marfen. (82, France, p. 1175.) For merinos of excellent manufacture.

Dauphinor-Prinand, Manufacturer, Isles-sur-Snippes (Marne). (471, France, p. 1200.) For merinos of excel-

leut manufacture. DAVID, BROTHERS and Co., Paris. (157, France.) For

merioos, and cloths mixed with organize and spun silk. The average of these fabrics is very good, the weaving satisfactory, and the colours and elegance of design very praiseworthy. Payter Lanes and Co., Sains, Richanmond. (138, France, p. 1178.) For the lowness of the prices at which

their fabrics are produced.

DELATTRE and Son, Manufacturers, Roubsix (Nord), (142, France, p. 1178.) This firm is eminently distin-(142, France, p. 117-3). This firm is emineatly distinguished by the excellence of its productions, and the specimens, now shown, fully justify the numerous distinctions which the French fovernment has, at several preceding Exhibitions, accorded to it. The Jury has noticed particularly a fabric, all wool, denominated "Chambard," or which the work is admirably perfect; the cleth named "Tole Victoria,"—equally beautiful; and the "natin de Chiné"—made of the finest materials and with unequalled

accuracy of workmanship. These goods occupy a very cuinent position amongst the French productions, and in the judgment of the Jury fully entitle the manufacturers to a Prize Medal.

Deliosse, Baothers, Manufacturers, Roubaix (Nord). (144, France, p. 1175.) For great merit in the articles they display. The "Chambard" is very admirably manufactured, and some of the "satins de Chiné" are remarkably fine in their texture.

remarkanty and to their exture.

Foster, Jostx, and Son, Manufacturers, Black Dyke
Mills, near Bradford. (143, Classes XII, and XV., p.
492.) The goods exhibited by this house are interesting, 492.) The goods extinited by this house are interesting, not only on account of their intrinsie excellence, but as displaying the great variety of fibrics produced in the worsted staff trade. They comprise articles for ladies' dresses, coatings, vertings, linings and serges, umbrella and parasol cloths, and damasks for hangings. The display of alpaca and mohair manufactores is remarkably densese, contiaga, vertings, lissings and sergese, unibrella and parasol cloths, and damassis for hangings. The display of alpaca and mohair manufactures is remarkably varied, and the worstigs is erea and regulats. The con-bilation of materials is very good; general designs of the jahries broaded by the Jacquard bounts are departs, and

the effects well brought ont. The contings shown (of which large quantities are exported to the Continent and the United States of America) are distinguished by their stoutness, fineness, and general excellence.

Gourchkory, E. and J., Manufacturers, Moscow. (189.

Russin, p. 1373.) For cloths, "satins de Chiné," all wool, brocaded; fabrics of worsted and organzine silk warp, and ca-limere-de-laines. These goods are distinguished by unsurpassed neutness of manufacture, excellence of

by unsurpassed nearness of manufacture, excenesses of design, and economy of production. Guessas, F. W., Glanchan. (101, Saxony, p. 1109.) For merines, all wool, of great regularity in weaving, and of excellent colours,

HAAS, P. and Sons, Manufacturers, Vienus, (259, Austria, p. 1019.) Damasks for furniture, of excellent combinations. The styles are magnificent, and the shades beautiful; and altogether the goods are of unquestionable

Holdmonth, John, and Co., Halifax. (166, Classes XII. and XV., p. 494.) For damasks and other furniture cloths, which are well made, and of good colours and considerable variety; some of the styles being very elegant.

etegant, Hoopers, G., Carroz, and Tarouraira, Mannfacturers, Paris, (1625, France, p. 1255.) For a great variety of light goods of the Burye class, plain, checked, and bra-caded, of excellent combinations. The cloth called "Bresilence," though very difficult of execution, is admirably worked. Medal awarded in Class XIII.

Hossvall, J. G., and Co., Mannfacturers, Bradford, (174, Classes XII, and XV., p. 494.) For fabrics made entirely of wool, and of wool combined with cotton and silk. The Jury have noted, as particularly deserving of silk. The Jury have coled, as particularly deserving of commendation, the article denominated "Saxony eloth," for ladics dresses, The weft is used from the finest Saxony wod, and the warp from the finest Australian wod, both combed by hand. The "Cobourgs," in cuton warp wefted with worsted, are admirable, and manifest a high degree of regularity, obtained by the excellence of the yarn em-ployed and the talent of the weaver. The "Henrietta" ployed and the fatent of the weaver. The "Henrietta" cloths are made from spun silk warps and weft of the finest Saxony wool, and are distinguished by a softness, combined with firmness of texture, that has never been surpassed. Hosel, R. and Co., Chemnitz. (86, Saxony, p. 1108.)

For damasks of superior manufacture,

JONETT, TROBAS, and Co., Mano facturers, Bingley, oear Bradford, Yorkshire. (144, Classes XII, and XV., p. 452.) For a great variety of stricles produced from alpaca werk, and silk and cotton warps, plain and figured. These goods are very well made, and show a good lustre. A new fabric of silk warp and linen weft is very neat, and affords encouragement for increased attempts in this direction KAY, RICHARDSON, and WROE, Manufacturers, Man-

chester. (186, Chasses XII. and XV., p. 495.) For a very admirable range of Chiné goods produced from com-hinations of worsted, cotton, silk, and linen, with printed warps. These are distinguished by the excellence of the designs and the economy of their production.

KNUEPFER and STEINHAUSER, Manufacturers, Greiz. (528, Prussin, p. 1080.) For merines and broended satins de Chiné.

LOHSE, EDWARD, Manufacturer, Chemnitz. (85, Saxony, p. 1108.) For damask goods, made with worsted and cotton, and worsted and silk. Their designs are in good taste, the combination of colours and materials very cre-

ditable, and the weaving of superior regularity.

M'CREA, H. C. and Co., Manufacturers, Halifax. (135, Classes XII. and XV., p. 491.) For damasks of great excellence.

MATRIEU, ROBERT. (France, 1443, p. 1245.) For merions of superior manufacture.

MILLIOAN, WALTER, and Son, Manufacturers, Bingley, (140, Classes XII. and XV., p. 492) For

blocks may fit; this point has been very successfully accomplished. All the designs are nearly executed, and the whole of the goods shown by this firm are highly creditable to their ingennity and industrial skill. MOLIET-WARMÉ BROTHERS, MANUSECUTES, Amiens.

(64) France, p. 110-2). For goods composed of worsted, mixed with silk, largely used for foreign consumption. The designs are in excellent taste, and the fabrics of heantiful texture.

MORAND and Co., Manufacturers, Gern. (731, Prus.a., p. 1690.) For draps d'été, or summer cloths, twilled like

merinos, very creditable in their manufacture.

Movacxax, —, Manufacturer, 27, Rue du Mail, Paris.
(1668, France, p. 1256.) For a remarkable exhibition of stuffs for furniture hangings, screens, table-covers, &c.
The zoods manifest an enisoust superiority in their mann-

The goods manifest an emission of the the control specialty in their manafacture; being stout, woven with great care, and peculiarly rich in their effect. The colours are beautiful, and perfectly shaded; and the designs indicate an artistic taste. This species of manufacture is adapted, mainly, for the saloous of the rich and the elegant.

PATRIAL-LEYS, SETOOIS, SUREAS, and Co., Mussificatore, Paris, (138), France, p. 1242. That firm has long been celebrated for the decided superiority of internal control of the decided superiority of internal control of the control

hy Russia, deserves especial notice. It is made from camels' hair, spon by hand, and is produced by the Bashkirs, a wandering tribe on the banks of the Caspian Sea. The yern is of astonishing regularity, and the texture remarkably good. The dresses made of it, the Jury are informed, are intended for Her Majesty the Queen of

HIS ROTAL HIGHNESS PRINCE ALBERT exhibits in Class XII, (p. 495) cashmere brocade fabrics, manufactured by Thomas Gregory and Brothers, of Shelf, near Halifax. These goods are composed of silk warp, and weft of wool shorn from the Cashmere goats in Windsor Park, the roperty of His Royal Highness. The Jary have examined these goods with peculiar pleasure, as being the first finished, and at reasonable prices.

made from customere wool grown in this country, and as one amongst immumerable punifestations of the deep and artive interest which His Boyal Highness has ever taken in promoting and encouraging British manufactures. Viewing these goods as distinguishable for the novelty of the materials employed, and the opening thereby offered for the production of a new class of fabrics, the Jury have unfeigned pleasure in drawing attention to this

PLANNILS

Wales is the country in which this article was originally made, and the flannel produced there is still beld in high repute, and deservedly so, for vests worn next the skin, though it is not so cheap as some others. It contioues to be chiefly manufactured by hand-labour, but few power-looms being employed. The finest is made from the fiecees of the flocks of the adjacent mountains. The supply exhibited is not large, but sufficient to show the neculiar quality and fuish of this fabric.

LANCASHIRE, especially Rochdale and its neighbourhood, is the district where flannels are made more extensively

than in any other part of the world, and in the greatest variety of widths, finish, and substance; that is, the thin the medium, and the thick, double-raised, or swanskin quality; both for home consumption and ex-Machinery is more generally used here than portation. chewhere; that is, the mule for spinning, and the power-loom for weaving. The greatest number of goods and Exhibitors are also from this district. SADDLEWORTH and its neighbourhood are remarkable

for the manufacture of Saxouv flannels, especially those of very fine make, which have been very much admired in the London and other markets. A few are produced in the neighbourhood of Leeds, of common quality, and finished the natural colour of the wool, In the west of England some white and dyed finnels

and coatings are made, but not extensively. The fine dyed flamels partake somewhat of the quality of light cloths, but very few are in the Exhibition. largand supplies a few low flannels and ecutings, commonly called Galways, made of Irish-grown wool,

and adapted for the native population, Canada furnishes a few common and low flannels, but not much in this line has been yet attempted here, prices were furnished for the few exhibited, nor do they profess to compete with those of England

FRANCE.—There is considerable merit in the five light flanuels made in France. They are fine spun, and of light texture, approaching nearest to the Saddleworth in wool and make: they are very suitable for printing, dveing, and outer garments. The quantity exhibited is not large, but sufficient to show the style and quality: the prices are reasonable.

Bragaru.—There is a very good assortment, especially

from one house, here (but which furnishes no prices), of various kinds of fianucis of the ordinary substance, and of medium and stout make, both twill and plain, white and dved of various colours; and of dometts of cotton warps. The wool, make, finish, and dye are good.
UNITED STATES.—The few flaunels exhibited from
America are well made and finished. They are made

from wool of the United States' own growth,

The Jury desire to record their high opinion of the

flannels exhibited and manufactored by Nesses, Kelsall. and HARTLE NORE, of Rochdale (486, Classes XII. and XV., p. 502), the excellence of which would have fully entitled them to a Prize Medal, had not Mr. HENRY KERALL, one of the firm, been an Associate Juror: also the productions of Mr. Lawson, of Ashton-under-Lyne, as exhibited by Mr. J. Wilks, 79 and 80 Wating-street, London. (6, Classes XII. and XV., p. 486.)

The Jury award Prize Medals to the following manufacturers, viz.:-

BENOUST, MALOT, and WALBRAUME, Rheims. For fine flarascis, well grade and finished, and at reasonable prices, CHATELAIN and FORON, Rheims, Marne, (86, France, p. 1175,) For flannels of fine qualities, well made and Dr Hovelle, A. J., Manufacturer, Themester, Dowlers, near Verviers. (203, Belgium, p. 1157.) For n large assertment of white and dyed finnels, swanskins, mediums, and dometts, well made, dyed, and fluished.

Ginuerr and Systems, of Massachusetts. (44), United States, p. 1463.) For n good make of finness of American grown wool, exhibited by Jostson, Switzia, and Co., Boston, United States, Learn, J., and Soxs, Mannfacturers, Calillards, Roch-

Leach, J., and Sons, Mannfacturers, Cailliards, Rochdale. (5, Classes XII. and XV., p. 486.) For a good general assortment of flauncls, of meritorious make and finish, at reasonable prices.

finish, at reasonable prices.

LLOTE, WILLIAM, and Co., Manufacturers, Newtown,
Wales. (234, Classes XII. and XV., p. 488). For all only assortment of real Webb flames, of good make and finish, and all made from the Webb mountain wool.

SCHOPIELD, BROWN, DATIS, and HAMAS, I Gerehamstreet. (3, Classes XII. and XV., p. 486). For a large assortment of meritorious financis, well assamblentered.

and of new designs. The manufacturers of these are Messex, John Schoffeld and Co., of Haybrook, Rochalde. Sultin, J., and Soss, Saddleworth, near Manchester. (235, Classes XII, and XV., p. 437.) For merit in very fice well-made flameds. Twerdall, J., and Soss, Manufacturers, Healey Hall, Rochdale. (, Classes XII, and XV., p. 456.) For finned

of excellent make and finish.

Money Award.

The Jury award a prize of 10% to J. Ramford, Mannfacturer, Rochdale, Lancasbire (237, Classes XII. and XV., p. 497), hand-loom weaver. For fine light gauze flancels, well your and woven.

BLANKETS

In Tuxus (pp. 5, 9, 11, 30) a very peculiar make of blanketa is arbitined, some of these with a regular strips across, others with alternate white and red stripes through out, about an inch wide, made very similar to the gazaces shared worn by ladies in summer; also a very fincieff, therefore the stripe of the stripe of the stripe of the berked dismond pattern blanket, entirely, kuited, the perfect workmanship of which possesses great merit. The Jury award Prize Needslas to the following Ex-

hibitors:—
ALBINET, jnn., 19 Rne de in Vieille-Estrapade, Paris.
(400, France, p. 1197.) For a small quantity of biankets,
which are extremely fine.
EASLY, EDWARD. (269, Classes XII, and XV., p. 499.)

Early, Edward. (269, Classes XII, and XV., p. 493.) Fur Witney blankets of a genuine eharacter and moderate price. FABAY, JOHN, and Co., Manufacturers, Witney, Oxfordshire. (268, Classes XII, and XV., p. 499.) For an

fordshire. (288, Classes XII. and XV., p. 499.) For an excellent assortment of real Witney blankets, of sterling useful qualities. Fight, E., and Sons, Manufacturers, Heckmondwike, near Leeds, Yorkshire. (37, Classes XII. and XV...

near Levels, 1078Shipp. (14), thusees A1s, mon A1s, p. 487.) For blankets with cotton warp, with good workmanship and elicapsess combined. This is a new article of produce, and it has become a great branch of trade to the slave states of America.

GANELS, W., of Milton Mills, Dundas. (139, Canada,

9.96.) For fine specimens of blankers, and well made. HACHER, COOK, and WOARAM, Dewbury, Yorkshire. (25, Classes XII, and XV., p. 487.) For a great variety of excellent blankers, in all qualities, for the Irish, English, and American markets; scarlet and blue blankers, for the American trada; and travelling rugs of various kinds.

PATTERION, J., Dundas Mills. (146, Canada, p. 966.)
For fine specimens of biankets, and well made.
ROSINSON, TRONAS, Devabury, Torkahire. (34, Classes
XII. and XV., p. 480.) For bhankets. This person is a
small manufacturer; but his goods are the shot of their
kind for quality and workmanship.
WILDOS, J., and W., Mannfacturery, Kendal. (245,

WILOON, J. J. and W., Mannfacturers, Kendal. (245, Classes XII. and XV., p. 497.) For excellent qualities of railway wrappers and Windermere rugs, of good styles. ZAALIJAO, J. C., and Sox. Manufacturers, Leyden. (34, Netherlands, p. 1144.) These geutlemen have exhibited a fancy blunket, of particular merit,

The Jury desire to make Honourable Mention of the reductions of the following grattenen, viz :-
BUFFAULT and TRUCHON, Essenne, (1122, France,

p. 1232.) Gerox, E., 57 Rue Galande, Paris. (1264, France, p. 1237.) Houses, B. T. and D., Coucord, United States. (United

States.)
Thounton, Firth, Ramsder, and Co., Leeds. (32, Classes XII, and XV., p. 487.) Awarded in this Class. Zeuradezo, 1, and Son, Leyden. (33, Netherlands, p. 1144.)

WORSTED AND WOOLLEN YARNS.

In reporting upon weeted, wouldn, algan, and inhar years, we have great to done them used reflection
that years, we have great to deep the most of efficient
to the property of the property of the control of the con

The Jury have divided the yarms which they considered to come within their province, into worsted, woolen, alpeca, mohair, realmere, and mixture yarms, white and colosured. The worsted yarms again, although all come soler the same general term, yet, being different in chawifer the same general term, yet, being different in chawick of the province of the province of the worst which is the most numerous, the Parry will call "Merino Yarm;" another, "Lustre Yarms," a third, "Genappe and Sundi Ware Yarm."

There might, perhaps, have been a further distinction made in the merior spars; namely, between such as were combed by machinery and those which were combed by hand; but as this distinction was not in all sease; expreced by the Ethibiton in that not been adopted. In weather years, gain, a further distinction might to deword to year, the property of the property of the carded well only any other than the property of the lange or hard stapled wood, fase or cours. Wood, therefore, which has not passed through the precess of combinge, either by meather; or by Inada, is stread "woolline."

With these preliminary remarks the Jury begin their Report on worsted merino yarns. Of these there are a larger proportion than of any other, principally from France, the districts included in the Zollverein, and Austria. There were also one or two samples deserving Austria. I nere were and one or the amount of note shown by English spinners, and one sample by a Russian establishment. The samples of 160 weft shown by J. Kand and Sons, and of 144 shown by H. Pease and Co., are very good indeed; but although deserving great credit, as specimens of threatle-span yars, yet the Jury were of opinion that the same yarn, had it been prepared on the French principle, spun on the mule, and equally weil managed, would have been improved in character. The mule, which is in all but universal use on the Coutinent for spinning short-stapled wools, is (combined with the Freech mode of preparation) better than the throstle for the production of yarns adapted to the manufacture of merino cloths; and this circumstance, no doubt, has been the chief came why the French have been able to take the lead through the world in merinos and mousse-line-de-laine fabrics. The best specimens of yarn, both as to softness, evenness, and fulness of thread for the number, belonged to PATURIX-LUFIN and Co.; computed by the English number it was No. 178, or 200 millimètre, and we have never seen a more perfect specimen of west yarn.

The French house which exhibited the negrest approach

The French house which exhibited the nearest approach as to number was that of ROGER BACTHERS and Co.; but their yarn was not made from so fine a wool as that of Paturle-Lupin and Co., and certainly not so well managed in the spinning; they were, however, upon the whole pretty good, especially their finest numbers of warp yarn. The samples shown by the house of BILLIET and HOOT (p. 1251) were equal to the best in the spinning of the

yarus, although not spun to so high numbers. The finest humber of merino weft yarn exhibited by the LEHPEM SPINNING CONPANY (165, English, p. 1106) was very good, and deserving of great praise, being very little inferior to that of Paturle-Lupin and Co. In addition to those already named, there were very good specimens of merino varus shown by the following houses:-

Hindenland, sen. (p. 1238), La Chapsele, and Levablet (p. 1238), Lucas Brothers (p. 1240), Pradine and Co. (p. 1243), Cauvet (p. 1232), Fournival, Altand Co. (p. 1243), Cauvet (p. 1232), Foundmar, Althouse, Bold Co. (p. 1487); Harthans and Co. (p. 1189), Deleguer and Co. (p. 1178), A. Them (p. 1017), Vol. and Worstein Varn Stinning Company (p. 1017), A. Schmidger (p. 1018), C. F. Solinio (p. 1108), Persolut and Ember (p. 1107), Solinio (p. 1108), Persolut and Ember (p. 1107),

Weiss, Jr. and Co. (p. 1090).

The Jury may also here mention a rather peculis kind of Barège yarn, said to be spun by the hand, exhibited by LANTEIN and Co. (1205), used in the manufacture of very fice gaute cloth, chiefly for men's veils. In the medium numbers of merino yarns nothing appeared superior in management to a specimen of No. 72, shown Mr. Pamasa, but spon by Jonas Smith and Sons; this yarn was shown in connection with specimens of tops ed by the patent machine of Mr. Preller, and if these were an average of the work done by this machine, it has almost attained to perfection in clearing the wool from noil, as well as leaving the staple unbroken. The No. 72 named appeared to be made from an ordinary quality of Australian wool, yet the yarn was clearer, feller, and more even than any other we examined of the same number. Perhaps it ought to be stated here, that as Mr. Preller, one of the Jurors, is a relative of the Exhibitor, he gave no opioiou in this case, but left the other members to themselves in the examination of this specimen.

Although there were many more Exhibitors of merino arus beside those named, whose yarns were npon the whole good, yet the Jary are of opinion that the houses already named excel the remainder in one or other

either in warp or weft yarns.

In lustre worsted yarns very few samples were shown, as compared with the merino yarns; those exhibited by J. Fortes and Son were thought the best. There was a good sample shown by William Thomas (p. 502), dyed in the preparation.

in woollen yarns, or such as were carded only (not combed), the specimens exhibited are numerous and connect, the specimens exhibited are numerous and generally good. Among the best of those which were carded from long-stapled woods, of low quality, were J. Axrovo and Son (p. 491), and Franc and Mastrian (p. 1236). In the fine numbers spin from better qualities of wool, there were beautiful yarns shown by Choutelle (Nerdew) (p. 1177), Sentis, Son, and Co. (p. 1227), Lantein and Co. (p. 1205), Xnorray and Co. (p. 1157), Joseph Kellen (p. 1217), Clasennach and Son (p. 1079), E. Leidenmost (p. 1017), and L. THOMAS (p. 1017).

There were also some good yarns shown by other bouses, but not equal to those of the parties named.

The specimens of hosiery yarns shown by A. Bergerss and Co. (p. 497), Barwix and Wheterstone (p. 497), and WINTIMORE and Co. (p. 497), were good, and gave full proof of the deserved fame which the Leicester houses have long maintained for the production of this class of yarns; there were also good samples of this kind shown by R. Poppleton (p. 497), and J. G. Schmidt and Sons (p. 1106).

There were very few exhibitors of cushmere yarns of these those exhibited by HUNDENLANG, sen. (p. 1238) were the best. Their finest number was a beautiful

In yarns made from a mixture of silk and wool (mixed in the carding and preparatioo), there were samples shown both white and coloured, which, so far as we were com-petent to form a judgment, were very good; but as this b.nuch of the worsted trade is comparatively new (at all 1106.) For merino yarus.

events to ns), the Jury could not venture to give as opinion as to the relative merits of the different yarns uf

In sipsca and mohair yarns the samples shown appeared to be very good, both in evenness of thread and mixture of colours, for the various descriptions of fancy goods made from them. This branch of trade, although comparatively new, has made rapid strides towards perfec-tion. A few years ago these raw materials were of little or no value, but through the skill and enterprise of those engaged in this trade, amongst whom Mr. T. Sait must by universal consent have a pre-cusinent position, they have now become very valuable; and it cannot be doubted, from the beautiful specimens exhibited, that they are destined to maintain a high price as compared with ordinary qualities of sheep's wool. In the first stage of its progress, alpaca yarus were found to be very imperfect in their evenness for the manufacture of plain goods: this obstacle is now entirely overcome, and every rimen of alpaca yarn we examined was all but perfect

in this respect Although the wool in its natural state is either black, brown, or white, yet from these three colours an almost endless variety is produced, enabling the manufacturer to secure shades adapted to all seasons. The specimens of fine numbers, exhibited by T. Saxt. (pp. 491-2) and J. Fostrax and Sox (p. 492), show that it is capable of being term as small in the shade of the capable of being spun so small in the thread as to reader it available, either alone or in combination with cashmere varus, or silk for fabrics of the lightest description

Most of the samples of mohair yarn exhibited, single and folded, were very good, both in lustre and evenness of thread, especially those shown by T. Salt pp. 491-2), J. FOSTER and SON (p. 492), STOWELL and SUODEN (p. 502), and TOWNEND BROTHERS (p. 493). The mohair poplin yarn made by the last-named house, is the only yarn of this description prepared for the manufacture of poplin fabrics, and appeared perfect; they had also some press assers, and appeared perfect; they find also some beautiful specimens of coloured mobiair yaras, suited for the small ware trade. There were also very good speci-mens of alpaca and mobiair yaras exhibited by— D. W. Shaap (p. 434), J. Whitzer (p. 494), W. Mit-

LIGAN and Son (p. 492), and BAUGHEN BROTHERS (p. The Genappe yarus shown were numerous and gen rally excellent in management: in the finer numbers of

this class there are very good specimens shown by Town-END BROTHERS, and J. ARROYN and SON. The variety of small-ware yarns shown by J. Scoden and BROTHERS was very great, and their general management must give them a good position in the market for this class.

The Jury recommend as deserving of Prize Medals the exhibitors named below, who, to the best of their judgment excel in this class of yarns:-

AKROYD, J. and Son, Halifax. (130, Classes XII. and XV., p. 491.) For carded and Genappe yarns BILLIET and HOOT, 43 Rue dn Sentier, Paris. (1550, Prance, p. 1251.) For merino yarns. CLARENBACH and Sox, Hutteswagen. (506, Prussia,

p. 1079.) For woollen yarms.
Choutekle Nephew, Rheims (Marne). (132, France,

p. 1177.) For woollen yarus.

Ecnorn, W., and Son, near Burnley. (130a, Classes XII. and XV., p. 491.) For carded and Genappe yarus. FOSTER, J., and Sox, Manufacturers, Black Dyke Mills, near Bradford. (143, Classes XII. and XV., p. 492.) For alpaca, mohair, and lustre yarus. HINDENLANG, SCH., Cramoisy (Oise), and 24 Rue des Vinnigriers, Paris. (1269, France, p. 1238.) For cash-

mere and merino yarns. KELLER, JOSEPH, Brunn, Moravia. '191, Austria, p. 1017.) For woollen yarns.
Lacuarette and Levanter, Rheims (Marne). (1285,

France, p. 1238.) For weolies yarns.
Lanyers and Co., Rheims and Tinqoeux (Marne),
(366, France, p. 1205.) For Barège and woollen yarns.
Lanyers Spinning Co., Puffendorf. (44, Saxony, p.

LUCAS BROTHERS, Baraneourt (Marne), (1331, France, p. 1240.) For merino yarus, PATURLE-LUPIN, SEVENUX, STERER and Co., le Cateau,

PATULE-LEPIN, SETIOUX, STERRE and CO., le Catean. (1814, France, p. 1242.) For merino yarms.
PASS, II., and Co., Mannfacturers, Darlington. (184, Closex XII. and XV., p. 453.) For merino yarms.
RAND, J., and SONS, Bradford, Vorkshire. (173, Classes XII. and XV., p. 494.) For merino yarms.
ROGER BROTTERES and Co., Trie Chalessu (Oise). (1449,

France, p. 1245.) For merino yarns,
Salt, Tirros, Bradford, Yorkshire. (139, Classes XII.
and XV., pp. 491-92.) For alpaca and mohair yarns.

SCHMIDT, J. G., jun., Sons, Penig. (49, Saxony, p. 1107.) For folded earl yarns.
SCHMIDDER, A., Neudeck, Bohemin. (193, Austria, p. 1017.) For woollen yarns.

SENTIS, Son, and Co., Rheims (Marue). (1011, France, p. 1227.) For woollen yarna. Solmato, C. F., Chemnitz. (47, Saxony, p. 1107.) For meripo varus.

Louien, September 1851.

STOWELL and SUCDEN, Bradford. (496, Classes X11, and XV., p. 502.) For mohair yarns and Av., p. 502.) For monary yarrs.

Scourse, J., and Bornizas, Dockroyd Mills, near
Keighley, Bradford. (167, Classes XII. and XV.,
p. 494.) For Genappe, mohalir, and popin yaras.

TOWNERS BROTHERS, Collingworth, user Bingley.

(162, Classes XII. and XV., p. 493.) For Genappe and mobair yarus.

XHO FRAT and Co., Dolhaim-Limbourg (Liege). (204, Belgium, p. 1157.) For woollen yarus. The Jury also desire to make Honourable Mention of the two following houses:-

Cavver, Chantilly, near Paris. (1138, France, p. 1232.) For merine yarns, FOURNIVAL ALTMAYER, and Co., Rethel (Ardennes), (221, France, p. 1187.) For merino yarus,

(USBRI MARIKA, ARIPOTA, AVANORA FABRICA, ARIPOTA, VICE-President of Chamber of Commerce, Verous, J. Ventre, Sardhia, Chaules Wanwica, 132 Cheapalde; Silk Warehouseman,

Tax Jean of this Class have in their awards endeavoured to adhere to the instructions they received from the "Soh-Cusmittee of Chairmen," as to the principles by which it was describle they should be governed; and athough in many cases the great ment of individual exhibitors seemed to justify such a deviation therefrom as would have enabled the Jury to recommend the Conneil Medal, they have abstrated from so doing.

Meisl, they have abstanced from so donog.

They have also make their assays in other with regard.
They have also make their assays in other with a remparison between the productions of exhibitors from different countries, or from the same country, might, of the
Meisla were insited in number, have rendered accessary,
Itali it leve of therwise, the defents, and to some extent
Itali it leves of therwise, the defents, and to some extent
and it has the contribution of the contributi

justice to all parties whose productions have heen submitted to their inspection and judgment.

Not among the least of the difficulties under which the Jury have felt thenselves placed, is that which arises to out of the discretion they were allowed to exercise of animing exhibitors whose aggregate productions, though of high merit, are not yet sufficiently so to entitle them to Prize Medals.

It must be obvious that unless all these articles are of the first class as to quality, a line must be drawn between those which are and those which may be very nearly so: this the Jury have endeavoured to do, and in naming those exhibitors who in their judgment appear in this latere entegory, they fithis it better to abstant from mentioning the grounds on which in each instance their judgment is based.

As there is a very proper rule which prohibits Jaryman from receiving Medias in the Clause where they serve, the Jury can only mention that three of their number elling children, no opinions on their productions are lettly as the control of the control of the control Turin (p. 1930); Mr. Sumed Courtsald, of the firm of SAMETI. CORTACTION and Co. 1930; and Mr. G. T. Kerny, Spittlifeld (p. 0.40) of Kerny, Six Manufactures, Spittlifeld (p. 0.40) of Kerny, Six Manufactures,

The important position which the silk trade, in all its stage and limaches, sow complex, would appear to call for an extended report on its present condition in each country where it is entimeted; has the Jury do not feel country where it is entimeted; has the Jury do not feel as the several classes of productions to be found in the Exhibition, and complete it in Una XIII, may suggest. They do not powers the elementh accessary in a statistical feer address the suspective to such points of interest as may arise out of the awards they have made, taking the averal countries which alwave callstell on lightaritiest order.

Before, however, they proceed to those particulars, it of this susadistion, the several amples to be found in the Eshkhistic affects that fixed except almost to be found in the Eskkhistic affects that fixed except a fixed particular articles are almost the process of the Eskkhistic affects that fixed except a fixed particular, it is no influently consecred with the three strike, it is no influently consecred with the three strike, it is no influently consecred with the three strike, it is no influently consecred with the three strike, it is not harder of the consecred to the proposed beautiful to the cross-strike and the consecred with the three strike, it is not harder to be consecred with the consecred beautiful to the consecred with the consecred to the cons

a angle sample. The importance of this material to France, as an article of national industry, may be gathered from the fact that the annual value of the quantity of the product of the contract of the product of the product of the other contracts is gat mentioned, the Jury have not the means of ascertaining: it cannot, however, but be very considerable.

Accessor

The silk productions of this country, as seen in the Exhibition, comist principally of thrown silks, ribbous, garments, furniture, and ecclesisatical mounfactured goods, landkerchiefs, craps, &c., all of which are more or less indicatory of a high state of cultivation, and reflect credit on the skill of the amounfacturers.

CHINA

The critivities of manufactured silks from this country, while it maply vartains the reputation she has long enjoyed for damask and other articles, is not sufficiently moved to justify mover than passing notice. The Jury have, however, much pleasare in tendering their thunks to Mr. H. H. Lurheax (p. 1422), and to Mr. L. Draxt (p. 604), for the benatiful collection they have made, and sent for imspection, of the goods peculiar to that nation.

ENGLAND.

A very slight glance at the goods exhibited by the English manifectures will enable those who have atteoded to the state of the slik trade of this country, of cherre the great progress which has been made in quaitiv, design, and chespoess during the last twenty year. Until within talls period this beamch of nonnefector was unspectures, both in regards the quantity and value of the goods produced, and the geater of the markets opcode for their rule and consumption. It is remarkable that theselved her are untited in the continuous contents, the characteristic in the continuous contents and the continuous contents are continuous contents. The temperature is a substitute of the contents consumed to the contents co

rated as special problètion on the firetige manifectured critic was reductived in an illustrational intensity of the control o

fabries are now produced apon the largest scale. It may be doubtful whether excess of competition is not rather calculated to lower the standard of perfection than otherwise; but where, as in the silk management the market is the word, and the consumption suffinited, the reope for the exercise of taste and skill in all producing countries is proportioustely extensive and producing countries is proportioustely extensive and pro-

https://ec.errainating these proliminary remarks, the Jury deem it right to merion that the bone of Lewrs and ALEXEN, of London [p. 505], exhibit some breends that the first of the highest order of artistic and mannfastering edits of the highest order of artistic and mannfastering this of the highest order of artistic and mannfastering they formithed both the pattern and the premainy means they formithed both the pattern and the premainy means the producing it by the waver, vp at they are not then-active mannfasteriores, the Jury did not noiseive it to be 10 which, under other circumstances, they would be 10 which, under other circumstances, they would be

emitted.
The Jary are of opinion that those sals should have controlled to the control of the co

Section Inclusion on the Pointering and Co. (p. 205); J. M. Pocer (p. 2001); R.DMATERIAL and SWILEROFF (p. 505); J. W. Pocer (p. 5001); R.DMATER and Co. (p. 504); SEWELL EVAS, and Co. FRANCE,

Loog the cradle and chief seat of the silk mammfacture, amply sustains its position in the present Exhibition. It would be difficult to do adequate justice to the varied chains of the throwster, dyer, designer, and waver, of the magnificent assortment of goods which occupies the department a viceor with the country, and which excites the portant branch of industry. The Jury have had no heritation in avanting Medials to the large number of exhitation in avanting Medials to the large number of exhihines where muses will be found below, and have redescring of that man, of dissistents. The well-surfield descring of the manefertures of Frame, and the number of the manefertures of Frame, and the number of the properties of the superior of the surfield of the results. The properties of the surfield of the surfield of the standard of the surfield of distributions, and has alread to the surfield of the disstance of the surfield of the surfield of the surfield of the first which they stribute mainly to the circumstance that for the surfield of the surfield of the surfield of the probability delay, which approach the translation of man-

GREECE

Only exhibits a few articles of comparatively small importance.

Holland,

The same remark applies to the comparatively small assortment from this country.

Indta. The manufactured silks from this important dependency

of the British Empire which have been exhibited, are inconsiderable in quantity, and out very movel in character. The Jury have been unable to award Medals to exhibitor, not only for this reason, but also because the parties exhibiting are not the producers or manufacturers. They are such, however, the less contrided to thanks for perment of the Entribution to be manufactured and exhibited.

ITALY.

The reputation of this country, as the chief preducer of the raw and thrown metrial, is well austained by the namples exhibited. Manufactured goods of great north are also to be found in this department, among which the velvets of Genoa and Turin must be signalised as fully sustaining their ancient character for beauty and quality.

PORTUGAL.

The manefacturers of this country exhibit a small assumement of rise gold and silver breeades for ecclesian it rial purposes, and miscellaneous articles in gauze, televic, smin, Res., but nothing of smill-ient importance to merit special notice. Considering the advantages of eliments and the administration of the control of the contro

Ressta.

Although, an before observed, raw silks are not comprised in their Class, the Jury has noticed mone very fair samples from this country, which, as also some thereon silks, affed promise of an important branch of trade being opened at no distant period. The same may be emphasically said of the manufactured silks to be found in this department. They are highly credible to text, the colours, the design, or the manufacture. Some magnificent silks for furniture and eccleiustical purposes decree special nodes.

The progress made in this important branch of mannfacture during the hat few years, is illustrative of the advantages which seldem fail to result from the removal of probibitory duties, and the introduction of n low tariff.

SPAIN.

The Jury have only been able to award one Medal to on exhibitor from this country; but specimens of good raw silk, and of considerable manufacturing swrit in ribbons, broad silks, &c., may be found in this department

ment.

A very little attention to details might make this branch
of manufacture of great importance to the country.

SWEDEN AND NORWAY.

The few articles exhibited by these countries offer no feature for particular notice.

SWITZEBLAND.

The character of the silk manufacture in this country demands a discriminating notice. The goods exhibited are of a low class, as to weight and texture, but are well made in all respects. The material employed is generally inade in all respects. I he numeron employed is generally from Italy, and excellent of its kind; the workpeople are economical in their habits; the manufacturers confine their attention to the precise kinds of goods which lost anit their localities, and their means of obtaining a regular sale for them; and, altogether, a trade of much importauce is sustained with Germany, Russia, Italy, and the

two Americas. Forty-two manufacturers of the canton of Basic ex-hit. In one case (152) are shown the united contributious of twenty-six ribbon manufacturers. This case contains some very good specimens of figured ribbons, which are clearly indicative of the improved condition of this trade in that district,

TCRRET.

The silk fabrics sent from this eastern part of the globe exhibit a pecaliarity of taste and execution, such as might have been expected from a country so essendifferent in all its habits from those of Europe generally. While there is much to excite currosity, and even admiration, there are no goods so strikingly superior and novel as to justify the Jury in awarding more than two Medals. There is, however, in the articles exhibited by this conatry, the most satisfactory evidence that at length the more intimate interconese with other countries which steam navigation has superinduced, has begun to tell favourably on their national character and domestic economy. It appears that, with the introduction presty generally by the Suhlime Porte of Europeaa attire, a relish for business, and an aptitude for mercantile trans-actions, have supervened. To the active exertions of the Turkish Comul-General, M. Zohran, we are mainly indebted for the highly ereditable display of goods in this department of the Exhibition, in which are to be found cocoons, raw and thrown silks from Brussa, Salonica, Adrianople, and Syria; manufactured silks from Constansimilar goods, made under the immediate superintendence and with the pecuniary assistance of the Turkish Government. The Jury would also direct attention to the light silk shirts, made from a comparatively inexpensive and otherwise useless raw material, specimens of which are worn by the boatmen who take charge of the graceful caique now floating on the Serpentine, and sent as a model of the boats which line the shores of the Bos-There are other woven fabrics, particularly phorus. ome gold embroidery peculiar to Constantinople and Smyrna, which deserve notice, but which do not belong to this class.

ZOLIVERITY.

In this department, embracing the manufacturing talent of a large portion of Germany, including Prussia, a con-siderable variety of silk goods is exhibited. The greater part, however, are of low qualities, suitable only to the home and the American markets, in both which they command an extensive scale. The velvets are perhaps the most important of these products, and are charac-terised by the regularity and evenness of the pile, and the economical application of the skill and labour neces-sury to their manufacture. They are articles which are largely exported from Crefeld and Vierzen, which are the chief seats of this peculiar branch of the silk trade.

The Jury award Prize Medals to the following Exhibitors:-

THEOWN, SEWING, AND SPEN SILE. ALSOP, ROBESS, and Co., of Leck (48, p. 506), for some excellent samples of sewing silks,

L'annia Baothess, St. Julien en St. Alban (Ardèche).

(41, France, p. 1173), for the perfection of their trans-for talle, and for organizine 16/18, 20,22, and 26/24 deniers, for sain and plush. BONNETON, J., St. Vallier (Drôme), (771, France p. 1217, for his organzine for plush and satin.

Buavo, Micharl, Pignerol (24, Sardinia, p. 1303), for excellent organizme for sating BRIDGETT, TROMAS, and Co., of Derby (49, p. 506),

for newing silks, purse twist, and sarsnet ribbons BRODUM, J. and J. and Co., of Leck (44, p. 506), for some excellent samples of sewing silks, CHANDON, CASIMIR, Alaix (Gard), (113, France,

p. 1170), for his fine six-thread greatedine, for the manufacture of " tulle bobin," and for his organzine 26/28 deniers, for satin. CHARTSON and Sox, Vallier, Drôme (796, France,

p. 1218; for organizine 13/13 deniers, for tulle; 32/34, for ribbous; and 19/20, 24/26, and 26/28, for plush and Coupene and Soucaser, Montaulan (Tarn and Garouse), (96, France, p. 1176), for gaze à hister (used by millers), of extraordinary perfection, numbering from 10

to 220 threads per inch.
DUNAINE, XAVIER, Tournon (175, France, p. 1181). for organtines 18/19, 20/21, and 26/28 deuler

Hanwan and Sons, of Halifax (42, p. 505), for beantifel spun silk yarus iu all numbers. HERME, AUGUSTY, Cross (537, France, p. 1204), for organzine 18/19, 26/28, and 37 deniers, for ratin

Negamente 10/19, 20/28, and 32 seniets, for salin.

Hottasourta and Sox, of Leeds and Congleton (61, p. 5/67, for spun silk yarus in all numbers, in the production of which they appear to have arrived at a high point of perfection, JAME, BIANCHI, and DURIGNEUR, Lyons (Rhône),

(1087, France, p. 1230), for grenadine and organizes. The Jury consider the productions in raw silk of M. Duseigneur, and of other exhibitors of this material, as belonging to Class IV. LANGEVEN and Co., Laferté Aleps (Seine-et-Oise), (898,

France, p. 1223.) for spun silks, in great perfection, from

France, p. 1223, 100 span sust, in great perfection, from the lowest to the highest numbers. MENSET, JEAN; Benufieu and Ausonay (Ardéche), (1657, France, p. 1236), for heautiful qualities of organ-zine, both white and yellow, especially those which are suitable for the difficult and delicate manufacture of

bloosles. POIDEBARD, N., di Porsici, near Florence (51, Tuscan) 1291), for organizoes and trams 22/24 and 36/40 deniers

Rignos, F. and Co., of Piedmont (30, Sardinia, p. 1303), for execulent organizine for satins.
SCHEIBLER and Co., of Milan (80, Austria, p. 1011),

for organzine, 28 deniers for satin, and for their greandinc. 48 demera in four threads, Surneymann, Louis, St. Jenn-du-Gard (1490, France,

p. 1248), for organizor 18/20 and 26/28 desires.

TEISSIER DU CROS, L. and E., Vallerangue (1031, France, p. 1228), for organizine from 20/21 to 32 34 desires, and for grenadines. (Prize Medal, Class IV.) VERTA BROTHERS, Milan (874, Austria, p. 1012), for

Rennove

BALAY, JULES, of St. Etienne (1064, France, p. 1229), for ribbous made of silk in the gum, and dyed afterwards, They are well finished, and command a considerable sale. Brussos and Co., of St. Etienne (1125, France, p. 1232), for the good taste and quality of their gauze ribbous, COLLIARD and CONTE, of St. Literae, Loire (1154,

Frauce, p. 1233), for the assortment of ribbons, which are considerable in quantity, novel in design, and credit-able to the manofacturer and draftsman in every way. Cope, Hannerron, and Co., of Coventry (70, p. 507), for an assortiment of figured ribbons made by power, which is good, when taken in connection with price.

Connella, Lyella, and Wynstyr (22, p. 504), of London and Nunea on, for ribbous which are in good taste, well executed, and the colours judiciously blended COVENTRY RIBBOSS CONSISTER (72, p. 507), for a ribbon exhibiting much taste and skill in its production.

Cox, R. S., and Co., of London and Coventry (66, 5.77), for an assortment of fancy ribbons of good quaties and mextures.

DE BART and BISCHOFF, Basle (152, Switzerland, p. 1275), for good specimens of figured ribbous.

FREYYOUGL and HEUSSLER, Basle (152, Switzerland, p. 1275), for good specimens of figured ribbons.

Larchen, Faure, and Co., St. Essenc, Loire (1293,

France, p. 1238; for good specimens of ribbons,
MESST, ANT, Vienna (246, Austria, p. 1019), for an
assortment of figured taffetas, gauze and erape ribbons, well manufactured. Mornino, Charles, Vienna (247, Austria, p. 1019), for

a good sud well executed assortment of figured and chine RICHTER, LINDER, PAle (152, Switzerland, p. 1275). The ribbous exhibited by this manufacturer are all plain

sain, of different qualities, and woren in the gum. Some are left undved, to show the process. They command n large sale ou account of their comparative cheap-

Sanavin and Co., Basle (152, Switzerland, p. 1275), for good specimens of figured ribbons. SARASIN, J. F., Basle (152, Switzerland, p. 1275), for good specimens of figured ribbons.

Solden and Co., Basle (152, Switzerland, p. 1275), for good specimeus of figured ribbons. SCLORE and STUCKERSHERGER, Basic (152, Switzerland,

p. 1275), for good specimens of figured ribbons.
Vionat Brothers, St. Etienne (1524, France, p. 1249). for chine ribbons, which are beautifully designed and executed; and for some specimens of figured ribbons.

MANUFACTURED SILER.

ANDAKAE, C., of Mulbeim on the Rhine, near Colorne (360, Prussia, p. 1071), for plain velvets and stamped fancy velvet ribbons, in good taste and cheap. Balleidiks, F., of Lyons (1065, France, p. 1229), for an excellent assortment of vestings in large variety, both plain and fancy; and for the figured velvets and terry, which also bear testimony to his extensive knowledge of

the resources of the Jacquard loom. Massing, and Patcuon, of Sarreguem Moselle (21, France, p. 1172), for an assortment of black

silk plash for bats, remarkable for the brilliancy of the suk pitch for Ints, remarkable for the brilliancy of the colour and the excellence of the workmanship, BAYMAN and STRETLE, of Hoggen (133, Switzerland, p. 1276), for plain and armure silks of the best work-manship, and for shot or glack grounder-Naples, which are excellent for a low-priced article.

REPORT ON MANUFACTURES FROM FLAX AND HEMP.

I'The figures after the Nanes (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOG; E.]

Jury.

Count FRANK ERNST VAN HARRACH, Chairman, Austria; Chamberlaia of Ilis Imperial Majesty, Presi-Count Frank Ensir Van Habhardt, Challman, Austril Chimeserian in the deep of the Chimeserian Society of Arts and Manufactures, Pragac.
Charles Tax, Deputy Columna, Fluder Oak, Barneley; Manufacturer.
WHAMAN CHARLEN, Joint Repeter, Symmon Hill, Bellatt Bencher,
Germen Lettwar, Joint Reporter, Belgium; Member of Senate, President of Clamber of Commerce,

LIZILATI, France; President of Chamber of Commerce, Paris, and of Ceatral Jury, &c. Jans M. Mastras, Guilford, Banbridge, Ireland; Massafacturer. Jonn Mon., Dumber; Maudicturer.

CARL NOBACK, N. Germany; German Commissioner.
ALLYANDER SCHLERER, Russin; of the Ministry of Finance.
John Wilkinson, J. P., Leeds; Flax Spinner.

BEFORE proceeding to describe the various flaxen products brought under our notice, we wish to uffer a few abservations on the progress and position of this im-portant branch of manufacture. We shall, however, con-fine our remarks to those portions of it which are in some way exemplified by the objects collected in the Exhibition from the mannfacturing countries of the world; as, in a Report like the present, a great accumulation of statis-tical details would be out of place, even were we prepared to offer such.

In consequence of the great autiquity of the Egyptian nation, we shall first call attention to the specimens of linea cloth sout from that country. These are in many respects much surpassed by the European manufacture, It may, however, be interesting to remark, that the first mention of linen in the ancient chronicles of the Jews certainly alludes to the productions of Egypt or some adjoining country. The Jewish priesthood were directed to use "linen garments and clothes of service;" and linen has been so generally looked upon as emblenastic of purity, that it is still considered becoming in the costume of ministers, and in the services of the Christian churches.

From the Asiatic continent we have some specimens of cloth made from "Color grass," This article is no donly, in its essential qualities and uses, a species of flax, and therefore properly comes under our notice. It has been produced for many years by the industrious and ingenious people of China. We have remarked that in the course people of Chinn. We have remarked that in the coarse kinds of cloth made from it, the fibre appears to be split into lengths, and attached to each other at the smaller ends. In this simple state the pieces are pat together with great dexterity. This is an interesting example of the position of this manufacture amongst one of the most ascient untions of the world.

Beside the coarser kinds of cloth, there are exhibited ome beautiful handkerehiefs and other fine lineus made from this material. At the present day "China grass is occasionally used in making coloured fabrics, combined with other substances, such as silk and cotton; and from with other substances, such as SIK and cotton; and riven the poculiar brilliance; in the fiber it shows to much ad-vantage in this way. It has not as yet entered into ex-tensive use for plain goods; but some very meriturious attempts to ascertain its stilly for that purpose have been made, and are still in progress, - (See pp. 370, 371.) Among the continental nations of Europe, the northern have long been celebrated for the production of flax and its manufactures; Flanders being especially distinguished for the beauty of its fine goods, and Russia and Germany for the strength and durability of their beavy and other

and Ireland were not much noted for the manufacture of lineus. The wonderful change, however, wrought by the invention of the "spinning jouny," and its application to cotton machinery, speedily led to the development of the same principle in making mill-spun yarn from flax and

same processes.

The immense and cheap supply of coal possessed by Great Britain, and the consequent facility in producing steam-power, combined with the privilege of first apply-to-administry in machinery to any great extent, has given ing spinning by muchinery to any great extent, has given her considerable advantage in the production of many descriptions of mill-span yarns and manufactured goods. Lately this system is becoming more general on the Coninent, although there has been for a long time a strong prejudice in favour of hand-spun yara, especially in Flauders. This latter country (comprising portions of Belgium and France) has long been celebrated for the production of the finest kind of flax, and the superior production of the inice and the last seem that the texture of its hand-span yarms. These latter require most careful and skilled manipulation, more particularly in the exceedingly fine description used in making the benutiful lawns and handkerciness of Cambray and Valenciennes. Ireland is producing, very extensively, both lawns and bandkerchiefs, more distinguished, without doubt, in the lower and middle-priced qualities for general consumption than in the extremely fine goods. The same country has now for many years enjoyed a high and merited reputation for its lineu manufactures, and supplies large quantities of the usual kinds to the differcut markets of the world. Scotland is pre-eminent in low-priced goods, of the qualities extensively used at hume and abroad. The principle of weaving by powerloom appears to be coming into very general use in that country, and also on the Continent, as will be found by

cetting our Report further on. The Jacquard loom is now much used in making damasks, and has tended to improve, in many re-

the manufacture of that article, both in the British dominimus and on the Continent, England produces a large quantity of mill-span yarn

from tax. Although her attention is more directed to the manufacture of cotton, she has contributed heavy finens, which, for texture and darability, are deservedly For the better elucidation of our decisions, we Invo-

divided our remarks on this Class into two principal departments, viz., 1st. The perpured fibre and spon or Inited fibries, such as yarn, threads, and cordage; and, 2ndly, The waves fabries of all kinds.

We have also divided these into minor sections, keep-It is a remarkable fact, that so long at hand-spinning ling, as near as possible, to the printed form of classifica-tion is such by the Royal Commissioners for the guidance of the Jurica. As a general rule, we have endeavoured to abstain from mentioning any person more than once in the Report; but there are a few cases where such persons deserve special mention in more than one of the subdivisions or minor sections. Some of their productions might be overlooked if all were mentioned together, and therefore we have occasionally noticed such cases twice We shall now proceed to detail the results of our ex-

I. FLAXEN FIRME.

In the specimens of prepared flaxen fibre the Jury did not observe anything worthy of very particular comm or any feature exhibiting a decided improvement in the management of hax for manufacturing purposes. Honouruble Mention, however, is made of two Exhibitors:— DESCRIPT and Co., Zele, East Flanders, Belgium (104, Belgium, p. 1154); and Lowis Draostica, of Bousbecque, There are other samples of Fictush flax which are

meritorious on account of their extreme fineness The Jury regret that the specimens of good that from Ireland are so few in number. Those exhibited by Mesers, Branash and Co. of Belfast, and rated on Schenck's patent hot-water steeping process in sixty hours, are the best samples; and those by Gailley, of Coleraine rated on the old cold-outer principle, are good specimens of the material prepared in that way. Both are worthy of commendation, and the Jury make Honourable Meration of them. [See "Royal Belfast Flax Improvement Society:"

The particular attention of the Jury was directed to the specimens of English flax, as illustrating the successful growth of that useful and valuable plant by some of the

agriculturists of this country

The samples exhibited by Messes. Haves and ATRANSON, of Leeds (45, Class IV. p. 1988), and grown by Mr. Wannes, of Trimingham, Norfolk, possess a large propertion of the uccessary qualities of perfect flux, and are equal, in point of quality and strength, to any the Jury met with of similar flueness. The dressed line, with the yarns from it, are excellent, and run up to a tolerable

degree of fineness.

The specimens exhibited by Messes. Caros. Neasox, and Co., of Selby (46, Class IV., p. 1984), are also very good, the finzen fibre being evidently well rated, scutched and put out of hand. The quality is sound, tough, and good. Great credit is due to both these firms for the pains they have taken to bring forward such meritorious opecimens of English-grown flax, The Jury have also to notice that an execulent assort-

ment of prepared flax, of various qualities, has been sent from Russia; but in comparing these with other specumens, the Jury did not observe anything worthy of special

Before quitting the department of fluxen fibre, the Jury desire to report that as it was questionable whether preparation of flax by the method of M. CLADSEN (Cl. 1V., p. 202*-3*) should properly come under their cognizance, they have not pronounced any judgment on the merits of this novelty. After being discugneed from the merits of this novelty. After being disengaged from the flax straw, it may be said to become by M. Claussen's process "cotton," in all its essential qualities, and is intended to be manufactured by cotton machinery, and to compete with that material. The Jury, therefore, do not feel competent to venture an opinion as to its practical utility and value.

China Grass.

Among the specimens shown of the different stages of reparation, dressing, and manufacture of " China grass, the Jury consider the series exhibited by Messes. Manare early consuler and series cannoted by Michael Mar-Brall and Co., of Leeds (Class IV., p. 192*), the most suitable for manufacturing purposes. This house is deserving of great commendation, for the trouble and expense it has incurred in testing the utility of this material.

Leeds, and spun from the flax grown by Mr. WARNES (of report), as already noticed, are superior in quality and spin-ning, without reference to price. They consist of from 40 to 200 leas line, and are, in all respects, good in quality, fully confirming the opinion already expressed of this

irchind produces a great quantity of flax yarns, but is not adequately represented in this department. There are u few specimens from Scotland, of fair quality.

in the exhibition of hand-spun yorns there is a great amount of excellence displayed in the various specimens, more particularly in those from Belgium. The samples shawn by Mesors, Berrnettor and Boxri, of Cambrai (p. 1158), are surprisingly line, perfect, and beautiful, being up to 1200's warp and 1600's weft yarn, and are certainly equal, if not superior, to anything of the kind hitherto produced. The specimens from Ireland are also very eredstable; that spin by Jane Magill, 8t years of age, being the finest (760 leas), and that by ANN HARVEY (about 600 leas), being the most perfect in quality and spinning (No. 106, p. 203* (lass IV.) The Jury recom-mend the award of money premiums to these individuals, in quality and as, from their lowly condition, this will be the best and mest useful recognition of their skill. The yarns from the HEEPEN SPINNING-SCHOOL, Biele-

The Jamis Hom the IRAPEX SPIRASHO-KHOOL, DIVER-ded Jobs, Zeildevein, p. 1083), me also very excellent, enableding the youth of the spinners. One sample pro-duced by a little gird of 10 years old, in very flaw, and exceedingly will span out of a weak unstrial. Another sounds, by a claid 8 years of age, is very good, but her quite so perfect. The dury ensistent the farmer of a proper subject for precunity resund, and have recommended that, and the two previously-noted cases, for thin distinction.

In the samples of linen threads, there is such varied and general ment, that the Jury found it exceedingly difficult to draw any marked distinction as regards superiority. Those exhibited by Messes Manshatt and Co., of Lanna, (No. 26, p. 511) are found to be the most perfect as regards evenuess of spinning, particularly in

the fine numbers; and the Jury desire to state that the Prize Medal already awarded to this house for examples of China grass, is intended also to mark the high merit of the threads exhibited, which would certainly have recrived a Prize Medal, if the award had not been already number on another ground.

In shoe threads, those exhibited by Mesers, W. R.

In since threads, those exhibited by National Holoton-wearin and Co. Locale (53, p. 512), are the best; and the samples shown by Misson, Fisharoon, Botssind Helding, Co., Glasgow (48, p. 512), and Messer, Trans, Tathan, and Walkers, Lecch (51, p. 512), are of good quality. The two former firms having been maraded good quality. The two former firms having been awarded Medals on other granuds, it is sufficient to record this opinion of the shoe threads. Cordage, 4c.

The Jury found the collection of ropes for morine and are stry rouns use collection of ropes for morne and other purposes, with cord, twine, &c., very limited in extent; and from the few goods exhibited it is impossible to have a precise idea of the progress made of late years in these manufactures. They found but one exhibitor worthy of the bonour of a Mcdal.

II. WOVEN FARRICS,

In the second department of flaxen products, namely "woren fabrics" of all kinds, the following constrict lave contributed: - England, Scotland, and Ireland, France, Belgium, Brasia, North Germany, Spain, Por-tugal, China, and Egypt. From the British dominions there is about one-half the

umber of the entire exhibitors and goods. (a) Cauras, Sailcloth, Sacting, Carpeting, 4c.

Some goods have been exhibited by several manufac-turers in conjunction, from the town of Bridport, and the Torus,

In mill-span yarst torus nppcars to be little competition.

The yarus exhibited by Mestre. Haves and Arrassoss, of being of options, in such case, that Medias could not be awarded, think that Particular and Honourable Mention is due to them. In this subdivision the Jury have found great excel-

In this subdivision the Jury have found great excellence, the exhibition of the various countries being highly creditable to the manufacturers engaged in this branch of industry.

(b) Woren Febrics, heavy and homoprical Linear; Rechabacks, Crash, Duck, Taba; Low Sheetings, Errorn and Finey-striped ditto, Doubles, Holland, Low Bruce Linear, Omalonys, &c.

The goods of this mobilition are of very extensive consumpton, and their chief characteristic, especially in the Scotch and Irith, is lowness of price; those exhibited by the manufacturers of Barnsley are of very imperior quality for family nee, and consist of an extreme assorment of these and the late previous properties of the mobility of the contract of the contract of the town and district. The Jury were much pleased with the general excellence of these goods.

(c) Plain Linen of all widths, bleuched or unbleuched.

In this subdivision the exhibition is very extensive and varied, and the goods generally display much care and skill of manufacture, particularly the finer descriptions. Const Harracts, of Janowitz, Moravia (285, Austria, p. 1020), has exhibited band-spon Nesched lines and

p. 1020), has exhibited band-spin bleached linen and bleached yarn of very fair quality. Also fancy damasks for lining extrigues and for covering furniture, made in limitation of silk. These latter the Jusy consider worthy of special notice;

These latter the Jusy consider woway as special member to and Harmeh, being a member of the Jusy (and also Chairmans), cannot compete for any Medial. The kill and merit, however, in producing these goods, deserve bigh commendation.

The Royal Beleast FLAX INTROVENENT SOCIETY

(p. 203*), have exhibited a very interesting series of patterns of the flaxen manufactures, characteristic of that country; comprising sacking, huckabacks, drills, diapers, ticks, linens, lawns, hollands, &c.

Wintrus, a merchant of Cunton, China (1419), has shown, in the department allested to this aution, a suriety of cloths and handkerchiefs made from China grass. Homorable Mention is due to him, as the only exhibitor of this peculiar article from that country.

Some sample have also been contributed by Massmath. Some sample have also been contributed by Massmath, the contributed by Massmath, and the surface of the contributed by Massmath, and the contributed by Massmath, the contributed by Massmath, and the contributed by Ma

developing the manufacture of this material.

Willoan, John, & Sons, of Northalberton (42, p. 512), have sent, with their other goods, a piece of sheeting made from China grass, and bleached in Ireland. This is also worthy of notice.

(d) Drills, Damasks, and Twilled Liness of all linds.
In this subdivision the Jury have had much difficulty in discriminating, the competition being so close and the excellence of the goods so general.

The town of Barnsley, as before mentioned, exhibits very deserving specimens of its manufacture in this and division. And the names of those manufacturers who lative contributed to this Exposition will be found only classified amongst those of whom Honourable Mention has been made.

CHARLES TER and Sox, of that town (37, p. 512), have exhibited a raried and beautiful assortment of plain and funcy cloths for welstecasts and dresses of excellent quality, and made with great taste in the patterns. The Jury would have awarded a Medal to these goods, but Mr. Tex, senior, being a member of this Jury, cannot enter into competition for such a distinction. Honourable and Special Metalon is therefore due.

(e) Cambrics, Lucas, and Printed Linear, for Decases, &c. This subdivision is the last of Class XIV.

Conclusion.—In conclusion, the Jury wish to remark, that the management of flax and its products involves a great amount of skill and labour, from the sowing of the weed iff the completion of the numericated activities, and the New ten expects that relatification is the excellence of the New ten expects and the state of the confidence of the new ten expects, as to render thirt task of the new ten expects, as the new ten expects of the thirty as much the many case, we exceeding difficult, they have equificate to recent appears need wherever and they have equificate to recent appears need wherever and they have equificate the new girns Models. Or Honourable Medicine, in each of the pattern The Jury have needed. Medicine, in cash of the pattern The Jury have needed. Medicine, in cash of the pattern The Jury have needed actives. The remarks in this Report, as before mentioned, as needed, as the pattern through the three notice, in

The Jary have decided on not recommend. Council Mechals in this Chas, an they considered that such a distinction was intended to mark either discovery or investion, or such a new application of known materials as might tend to important results in the department of industry to which it was applied, and not to perfection of manufacture or taste. It is antifactory to the Jury to be able to state, that

It is satisfiated by to the Jury to be able to state, that there has been no disagree-cureat amongest the members in making their decisions. This fact not only confirms then in the function of their awards, but will tend to strengthen the public relinace in their impartiality. The office of Judge or Jurur is at all times one of great

responsibility, and on the present evension more particularly so, as the whole world is marting their decisions. The members of the Jury are sensible of the confidence placed in them, in being selected for such an heasurable task, and they have endeavoured intitlifully to discharge the important and oneroos duties cutrusted to them.

The Jury award Prize Medals to the following exhibitors in the various subdivisions:—

INFFERIAL ALKLANDSOVER MARVIACTORY, Russis, (19a, Russis, p. 1366, for casuus of superior quality, Andrews, Michael, Ardoyne, Belfast, Ireland (3, Andrews, Michael, Ardoyne, Carlot, C

p. 510), for excellence in double damask table-clotbs and napkins.

BERTHELOT and BONTÉ, of Cambrai, Belgium (216,

Belgrium, p. 1158), for superior excellence and fineness in hand-spin flax yards. BETERS WIDOW & Co., Zittau (51, Saxony, p. 1107), for superiority of design in damask cloths and napkins. BERSELL, DAVID, DUMFORMISIC (27, p. 511), for damask

table-cloths and napkins of superior quality, fineness, and design.

Boxesure and Noate, Bielefeld (562, Pressia, p. 1082), for fine linear.

Boxtrack and Sox, of Cambrny (32, France, p. 1172),

for cambries of exceedingly fine and beautiful finish.

CLINDORS, HILL, & Co., Beshridge, Ireland (20, p. 511),
for dispers. An excellent assortment, bleached.

COORSMAN, A. J., Rebecq, Belgium (212, Belgium,
p. 1150), for the finest and most perfect lace thread made

from hand-spun ynrus.
Coruson, Janes, & Co., Lisburn, Ireland (92, p. 516),
for an extensive and admirable exhibition of fine, wellmade damask table-cloths and mpkins.

COX BROTHERS, Dundee (63, p. 513), for low-priced striped hedding and hessians. Crnoxr-Decleracy. Alost, Belgium (235, Belgium, p. 1158), for superiority in the colour of his lines

threads.

DAUTRENES and Co., of Lille (Nord) France (187, France, p. 1178), for excellent quality and evenly-span flax-yarus, from 100 to 320 less.

Discock-Wattmator and Battootts, Roulers, Belgium, (221, Belgium, p. 1158), for fue liness. A good variety, Exemour, Astrox, Heirs of, Warendorf (549, Prassia, p. 1681), for neatures of design in his exhibition of damasks, and ecoders-s of colour in his liness.

masks, and goodness of colour in his lineas.

France, Boyal Manufactory of babells II. at, Spain (193, Spain, p. 1341), for canvas of superior quality.

FISLAYSOS, BOUGHELL, & Co., Glasgow (48, p. 512), for the strong threads exhibited in the coarse and

2 B 2

- middle sizes, and for the great taste and neatness with which they are got up FRASSIS, DOUGLAS, Arbroath (79, p. 515), for canvas of
- superior quality, made by steam-power locass, Grassor and Co., Lyons (52b, France, p. 1204), for superior style of damasks, and excellence in carrying out the patter Haso, E. F., 18 Rue des Petit Augustins, Paris (806,

France, p. 1221), for the extraordinary dimensions and excellence of canvas for historical painting. Henring, John, Waringstown, Ireland (16, p. 510),

for damask table-cloths of superior patterns and quality, bleached, brown, and mixed colours HIVES and ATKINSON, of Levels (45, Class IV., p. 1951),

for good quality in mill and span yarns.
Holdsworth, W. B., and Co., Leeds (53, p. 512), for the superior style and colour of their satiu-fluish lines threads, being the best examples of threads prepared by that method.

KIRK, WILLIAM, & Son, Armagh, Ireland (10, p. 510), for brown lineus, of low description and prices; Hollands, brown, black, and state-coloured, &c.

KRARITA, C. G., and Soss, Freyburg, Silesia (128, Prussia, p. 1055), for a good assortment of blenched platillas of export quality.

Kuss, E., Antwerp (468, Belgium, p. 1166), for variety

of low heavy goods, comprising canvas, imitation Russia sheeting, &c. Laino, J. and A., Dundee (63, p. 513), for ducks, imitation Russian sheetings, striped ditto, &c., of excel-

lent quality, LAWSON, ALEXANDER, Fifeshire (63, p. 513), for a large and low-priced variety of dowlas, hneks, sheeting, window-blinds, &c.

M'CAY, THOMAS, Dromore, Ireland (19, p. 511), for an exceedingly fine piece of fronting linen, made of millspun warp and hand-spun weft, exhibited brown,

MALO-DICKSON and Co., Dunkirk, France (329, France, p. 1192), for canvas of superior quality. M. MURRAY, TROMAS, and Co., Dromare (25, p. 511), for a superior assortment of fine linens, bleached,

Marshall and Co., of Leeds (55, Class IV., p. 190* for their examples of the preparation of "Chius grass for the purposes of manufacture.

Meanie-Lerevae & Co., Havre (926, France, p. 1224),

for a varied assortment of cordage of remarkably good Mestivien and Hanoto, Valenciennes, France (636 France, p. 1208), for the great excellence and superiority,

exceedingly-fine and very beautiful finish, of their assortments of cambries, plain and bordered.

Milvain & Haarond, Newestle-on-Tyne (71, p. 514), for eanyas of superior quality, mode with bands, which

add to the strength. Mönnan-Vanlagre, J., Ghent (231, Belgium, p. 1158), for variety of canvas of tow, flax, and hemp, and very

broad coverings for milway waggous.
PARMETER, P., Isighem, Belgium (222, Pelgium, p. 1158), for fine linens of superior quality, exhibited brown, and made from mill-spun yarn of Liege. Also a

small assortment of handkerchiefs, very well manufactured.
PELDRIANS HEIRS, Hoheueile, Bohemia (288, Austria, p. 1021), for fine lines, of hand-span yarn RICHARDSON, I. N., SONS, & OWDEN, Belfinst (7. p. 510),

for a superior assortment of light shirting liness for export, SADLER, FENTON, and Co., Belfast, Ireland (18, o. 510-11), for a superior assortment of heavy shirting

nens, for home trade, bleached, SCRIVE BROTHERS, Lille, Nord, France (1007, France, 1227), for damasks, including their yarus and poweroom goods. SMICTON, J. and Sox, Dundee (63, p. 513), for dowlar, crequillas, ereas, &c., of light and low-priced quality for

export.
WARNIG, Cus. Dav., and Sons, Gress-Schonau, Zittan and Leipsie (53, Saxouy, p. 1107), for damask table-

cloths and nipkins, of superior neatness in design and good WARNER, JOHY, of Trimingham, Norfolk, for the drabbets, &c.,

growth and preparation of the hax cameron of Hives and Atkinson, of Leeds (45, Class IV, p. 198*).

(543, Prassia, p. 1081), for lineus, well bleached. Williams, Jones, and Sons, Northalterton, Yorkshire (42, p. 512), for plain and fancy drills of very superior

The Jury make Honourable Mention of the following Exhibitors :

ANDE-BEATE Chest (209 Belgium, p. 1158), for waggou-coverings and other beavy goods made by power-Been and Soxs, and other exhibitors, Switzerland (163,

Switzerland, p. 1277), for damasks and drills of fair quality BECK and Son, Courtrai, Belgium (324, Belgium, p. 1161), for a very fine piece of linea of hand-span yara, bleached. (Prize Medal awarded in Class XIX.)

sleached. (Prize Medal awarded in Class XIX.)

Braz., T., and Co., Lurgan, Ireland (6, p. 510), for a
rood assortment of cambric hundkerebiefs. Bennand and Co., Belfast, Ireland, for good hot-water steeped flux. (245°.)

BEVERIDGE, ERSKINE, of Dunfermline (29, p. 511), for damasks. (He also exhibits a good variety of stair and floor covering, &c.)

BOLENES and NOLTE, Bielefeld, Germany (562, Prussia, 1082), for evenly-pun flax yarns, 480's being the Baudohin, Alexander, Kaluga (216, Rossia, p. 1373),

for good canvas. Bt anacst Bnormens, and Co., Horfelgii, (799, Prussia, p. 1094), for water-pipes of hemp, with Canten, J., Barnsley (3:, p. 511), for ducks, drab-

bets, &c. CARTER BROTHERS, Burnsley (35, p. 511), for ducks, drobbets, &c. Castragena, Royal Arseual, Spain (191, Spain), for

excellence of cordage. CATOR, NELBOX, and Co., of Schy (45, Class IV. p. 198*), for the excellence of their flaxen fibre. (Honourable mention awarded in Class IV.)

Court, Blass, and Co., Belfast (24, p. 511), for good damasks, made with power-looms; and a beautiful and novel design, on paper, for a table-cloth, not yet executed Courses, Whillam, Lisburn, Ireland (93, p. 516), for

very fine damask cloth.

Datuné, A., St. Quentin (1170, France, p. 1233), for ood dannsks, Denocuars, Hesse, Contrai (239, Belgium, p. 1158), for good drills and other articles DESCRIPT and Co., Zele, Fast Flanders, Belgium (104, Belgium, p. 1154; for specimens of Flenish tlax, being

the most perfect from Belgium. (Prize Medal nwarded in Class IV.) Donntarar-Hulis, Ghent (208, Belginin, p. 1158), for brown hand-span sheetings, imitation Russian ditto,

good quality, Donnen, T., Alost, Belgium (233, Belgium, p. 1158), for some good eambrie handkerchiefs, white and printed, and a variety of other linen articles

Dox, W. & J., and Co., Forfar and Dundee (63, p. 513), for brown sheetings and Osnaburghs of good quality. Don PROTREES and Co., Forfar and Dondee (63, p. 513), for brown sheetings and Osnaburghs of good quality.

Documentum, Locas, of Bousbeegue, near Lille, Nord.

France (177, France, p. 1182), for the best and most perfeet specimens of scutched flux, rated and prepared on the Courtrai system. (Prize Bedel awarded in Class W.) Eason, Alexandra, Duidee (63, p. 513), for rail-cloth and socking of tow, homp and jute.

EDINDUBGH HOPE AND SAIL-CLOTH COMPANY, Editburgh (p. 513), for good canvas, ELEXENDOR, E. F., (470, Prussia, p. 1078), for sych-

ess of good middle-sized yarns. Frank, Wenzer, Bohemia (284, Austria, p. 1020), for laws of fine quality and colour.

Figure 182, H. T. Barasky (36, p. 511), for ducks,

GAILEY, D., Coleraine (106, Class IV., p. 203°), for flax steeped upon the cold-water system. GHENT LINEN COMPANY of Belgium (250, Belgium, p. 1158), for the heavier examples of tow yarn

GODARD and HONTENDS, Valenciennes and Paris (240, France, p. 1188), for a good variety of white and printed fine cambries. Goess, L. J., Termonde (237, Belgium, p. 1158), for

general excellence of cordage GUYNET and RECOVET, of Combeny and Paris (254, France, p. 1189), for fine cambrie

HATTFRSLEY, PARKISSON, & Co., Barnsley (36, p. 511), for ducks, drabbets, &c. HANNORTH and CARNEY, Barneley (36, p. 511), for

decks, drabbets, &c.

HEXXIVO, JOHN, Waring town, Irrland (16, p. 510);
Honourable Mention is here anale, as this exhibitor is awarded a Medal for damasks, which also includes the

variety of cambrics and printed goods he has exhibited in this subdivision Holloway, T. J., Salisbury (74, p. 515), for the general excellence of the cordage exhibited by him.

HUNT, W. and Sox, of Dunfermline (28, p. 511), for

good quality and designs in damasks.

Journal Honnaire, and Co. Augers (532, France, p. 1295), for good canvas, principally made of hemp. (Prize Medal awarded in Class IV.) JACKSON and MATTHEWHAN, Parmiley (36, p. 511), for

ducks, drabbets, &c. KAZALETT, A., St. Petersburgh (102, Rassia, p. 1369), for general excellence of cordage

Davity Kiver, Chispow; Shawl Merchant, N. Kivasini Yi, Initel States; Manufacturer, Jona Mionava, Grindow, Phisby; Manufacturer, William Francer, Reporter, Di Climecuter Cardena, Taris Saar, J. P., Bradford; Manufacturer, Franchise Seava va, Hubbles-field; Merchant, Juny II, Swire, Enited States; Merchant, SB Ganova Wikasswo, Tarkey.

Associates, F. Bravoviller, France; Spinner and Manufacturer. (Jurer in Class XX.) Gronge Haus, 31 Milk Street, City; Stawl Manufacturer.

A.—Mixen Woven Farrics, of various Materials, 20,000 lules per annum. Of mobair, in 1841, 3,621 short with enther Cotton, Linex, Wood, Silk, bles; in 1850, 12,884 holes. MORAIR, OR OTHER SUBSTANCES.

Ting description given in the "Classification for the use of Juries" of the articles to come under the examination of this Class is so very miscellaneous, manuely, "for dresses, damasks, aprous, shoe and boot cloths, livings, ureses, unusass, aprous, ance and noot cloths, licitizs, cravats, vestings, pouchos, pantalum cloths, coatings, tweeds, quiltings, plaids, tabinets, poplins, paramatas, chalis, barèges, cashineres, articles for funiture, shawls, that some necessity was found for drawing a line more definitely between this and Class XIL, where, under the head of "Woollen and Worsted," many of the above articles would be better placed.

We have consequently confined our notice to the fol-lowing articles:—Vestings, coatings, tweeds, linings, pantaloon stuffs, shoe and loot cloths, cravatings, plaids, tabinets, poplins, paramattas, cashmerets, cassinets, chalis, bardges, cashmeres, shawl cloths, and Utrecht velvets.

General Renvarla.

It is difficult to give a correct idea of the origin of many of these fabrics. Varieties of them have been made in Yorkshire, Gloncestershire, and Nurfolk, from time in Torkshire, thoucestershire, and Aurtois, from time immemorial, and are of equally ascient date in many parts of Europe. The introduction of spin silk with wood may be dated from 1685, when the revocation of the Edict of Nantes brought over to Spitalfields and to Norwich especially nearly 30,000 artisans from Paris and Lyons, who established these manufactures in England. We find that the importations of silk into Ireland in that year were of 80,000%, value. Tabinets or poplins have been produced in Ireland ever since 1771. Novelties are being constantly introduced, both in style and texture. as well as in new combinations of materials, and many most valuable experiments of this character have been adopted, particularly within the last ten years. We may notice two articles in particular, which have become of great importance to this class of manufactures, viz., alpaca and molair. The former is the wool or hair of an animal of the llama tribe from the region of Peru; the latter, that of a goat peculiar to Asia Minor: and some idea of the rapid development of such novelties may be formed the Byon seventy-many returns of imports, vis...—Of alpice. Portugal has exhibited some good copies of French and from the fallowing returns of imports, vis...—Of alpice. Portugal has exhibited some good copies of French and the portugal from the fallowing the fallowing from 186 to 1856. [82] has backed give fair promise of excellence. Issti to 1845, 13,000 backs per annum; from 186 to 2566, [82] has contributed some specimens of its carry usages.

We believe that to England must be accorded the chief credit of searching for and adopting most of the new and credit of searching for and adopting most of the new mod important materials which are every year being intro-duced into these manufactures, tending naturally to in-crease the value of the trade; she also takes the lead in the quantity of production. France, ever ready to adopt and improve, produces very largely the same articles, and is peculiarly successful in the fiper and richer descriptions, where delicacy of design and colour is most favour-ably applied; and had she equal facility with England in sending her productions into foreign markets, the development of her medium classes of these goods would have been more complete. Anstria has made very great progress within the last ten years in these fabries; her materials are excellent, and ably put together; and she presents them at low price, for a large internal consumption. Bohemin, in particular, supplies tissues of a quality that bears the stamp of decided progress. Labour in these countries is extremely cheap, and the artisaus are intelligent, and if the progress now apparent continues with gent, and it me progress now apparent continues with increased energy for the coming ten years, their pro-ductions may vic, particularly in price, with those of all Europe; hot we find no originality among them, whether of design or manufacture. Prustia and the States of the Zollvereis have given valuable proofs of their powers of copying the productions of France and England. They require but the support of capital, and the encouragement of a natural taste for design, to become the producers of the best articles at low prices; for in many cases they have the raw material at hand, and they are not wanting in either energy or ingenuity to give the fullest develop-ment to such advantages. In Belgium we find proofs of a very active commerce in these fabrics, and an increasing desire to take advantage of the demand for exportation of midding and low-priced goods. The ancient excellence of the weavers of that country has not, apparently, prompted the manufacturers to keep the lead in textile fabrics, either in character or quality. Their produce is very extensive, both for the home and foreign demand, very extensive, som for the mone man though a commo, and they appear to prefer leading purchasers to their stores by cheaponess and goodness of manufacture, rather than by the attraction of superior excellence or novelty.

in these fabries; but as they are chiefly the produce of artisas of other countries, they should only be noticed as evidence of her desire to promote the industry of her population in working upon the raw masterials at her command.

The peculiar feature of this manufacture is, that is most descriptions the hand-loom aloue is made use of giving employment to a vast number of persons, we may perhaps say millions; who are thus, by the various occunations connected with it, placed entirely above want.

Particular Remarks,

Exhibitors of various articles are in number as follows:-

Among whom we proceed to notice those who are most worthy of remark.

SCHWANN, P., Haddersfield (115, p. 400). All his sasortment of embosiner calculures and other descriptions are of perfect character, particularly the valentine. The designs are rich, and in good taste; and the execution such no cereate regret that the mames of the artisans are not recorded. This contributor being a member of the Jury of this Class, his goods are not under consideration in compse-

tition for the reward of merit.

The Jury award Prise Medals to the following Ex-

hibitors in this department:

ATRINSON, R., and Co., 30 College Green, Duhlin (256, p. 488), for puning of excellent quality, rich in colour

p. 498, for poplins of excellent quality, rich in colour, and perfect in manipulation. There are some double and triple corded, of admirable excention. The figured pieces are of good design and brilliant effect. The specimen given of their weaving, by the presence of one of their weaving, who works at an elegant loom apon a rich and elaborate design, is hubly uteresting and instructive.

claborate design, is highly interesting and instructive. BOLINGBROKE, C. and F., Norwich (311, p. 501), for poplins, Palin, striped, watered, of superior make and excellent colours; the character of their manufacture is highly neritorious.

Biown and Fonstron, 5 Vigo Street, Regent Street, London (9, p. 480), for a variety of superior vestings, of cetton warp and well of wood, worked by Jacquard, in designs of excellent taste; likewise stuffs of other descriptions. Their, wastecontings of plants vegonia will be found remarkable for novelty and excellence, and as heing well adapted for a longe consumption.

CATTAXX BROTHERS, Bruse-le (244, Belgium, p 1159), for pantaloon stuffs of cotton-wool and lines with cotton. They are fabrics of good taste and extensive consumption, and highly deserving of marrist for cheapment. CATTAXX—GAUGUS, Courtray (245, Belgium, p, 1159), for fabrics of the same description, has theirly calculated.

for fabrics of the same description, but chiefly calculated for the lower classes. A Prize Medal is awarded for goodness of texture and cheapness.

ness of PXTUTE and encapness.

CONMAID, D., Vienna (not in the Catalogue), presents
specimens of vestings of spun silk and wod, also in fine
SXXON wod, figured on the Jucquard. There are some
with comera embroidered on a new principle. These
goods are of decided merit

Casco, F., 163 line de Charonne, Paris (809, Franco, p. 1219), for vestings distinguished for the parity and elegance of their design, and for fineness of execution, particularly in the cashnere descriptions, attention being apparently more given to quality than to chemposes of price: his goods are of high merit.

Dar, Jonn, and Son, Mold Green, Haddersfield (113, p. 490), for a pantaloon stuff, warp of cotton with a weft

of carded wool, crossed on one side only, of the character of ensainer. The surface of this stuff is soft to the touch, without having been sheared. This fabric is rentaricable for excellence and equality of tints, difficult to accomplish.

Emisson Brothers, Victora (304, Austria, p. 1022), for vestings of a strong and useful character, made with cotton, wool, and silk, of moderate price, worth about 4e, per yard; some with combination of colours.

Fassis, "jim," librium (France's, for a variety of excellent goods of a similar description, destined for home coassumpton, and got up with good taste, shiefly waincutings of cetton warp shot with wool and silk, also with combeil wool, such as cashimere and victuitas, figured with span silk, of good design and quality. These examples are of great merit, both in execution and lownum

of price.
FENER, B., Gladbach (587, Prassis, p. 1083), for a variety of superior fabrics, well coloured and of excellent materials, in several combinations of cotton, wool, and silk, for summer cloths and dresses, such as the Victoria cloths and cassines, which deserve particular notice.
GRAIR and NEVEARDY (591, Prussis, p. 1083), for extince, made on the Jacquard loom, of cotton warp

vestings, made on the Jacquard loom, of cotton warp shot with weed, and figured in various styles; they are of superior merit. Hass, Philary, and Sons, Vienna (259, Austria, p. 1019), for woollen velvet shot with eviton, of superior

quality, soft in texture, and strong. Medal awarded in Class XII.

HETMANN, CHABLES, and Co., Cerfeld (575, Prinsia, p. 1082), for vestings, chiefly made on harness looms, of the character of poplin, corded with cotton in weft. Some worked with good thread have a first effect, at a moderated

price, averaging not more than 3c, 7d. Their productions are not devided merit.

KACTPRANN, H., Berlin (117, Prassia, p. 1055), for speciments of woodlen velvets, of planshes of goots' latt of various descriptions, printed, and elinis, and all of high

Variotis El-Septement, protects, most castle, and compenies, full descreting the guards.

Lamorte, Jacob, Hedder-Sield (115, p. 40%), for cassinets of a very superior quality, exhibited abong with the goods of Mr. Schwamri although his time does not appear to the control of t

excellence.

Leanorra, W., Huddersfield (115, p. 490), for ensincts
of a superior quality and novel make, presenting different
faces of natin and cloth, where the difference of tint in
dying is not perceptible; and other fabrics of superior
merit. This manufacturer has exhibited his specimens

Lexinxus - Decarruse Buornaus, Roubuix (1000, Pracee, p. 1220, for vestings of excellent quality, and although clainfly prepared for the middle classes, distinguished for good design and make. We noticed particularly a waisteening of cotton warp, with sect of conshed wood, checked with silk. Also some calentins, figured with silk, of admirable design and fabric. Their tasteful and vested edseign goods are prepared for a very

with those of Mr. Schwann.

large consumption.

Laranter, Discamps, and Plissast, Tournay (240,
Belgium, p. 1188), for specimens of pantaloon stuff of
lines warp and weft of satisf. Those at the price of
64d, are extraordinarity cheap.

Lienar-Charpara, Madame, Tourany (242, Belgion, p. 1158), for specimens of pantaloon stuff of linea warp, and west of cotton sating, well manufactured, and at the low price of 7d, and 8d, per yard.

bow price of Jd, and 6d, per year, an amount of the per year, and year, ye

mere, surp of cotion and weft of word (carded merina). This stuff is milted and worked with a faif, and is remarkable for its softman and perfection. The tints of both cotton and word are so perfectly equalized as to be rearcely distinguishable. There is another keney mere warp of cognatine silk and weft of carded wool, equally well blended in colours, of which the fiel and quality are admirable. Their merit is undoubted, Morgensorie and Kregmann, Elberfeld (502, Pressin, p. 1080), for woollen velvet, plain and figured, of a

quality of distinguished merit.

Weaker, vs. usettingui-f. on the character of the character of the character of velvet with goods hair and orders of out on which with sold well. These are of superior character: but their vs. with sold well. These are of superior character: but their vs. with sold well. These are of superior character: but their vs. Their enthroid and silk are truly remarkable. Their enthroidered waist-castings by the "button becker," aren't puri-outs attention for excellence of workmanship. This house-

process arrives of high metts. (1900, Tenze, p. 1107. Eventus, Chance, Beliani (1900, Tenze, p. 1107. Eventus, Chance, Beliani (1900, Tenze, p. 1107. Eventus, Chance, with cotten warp and wift of silt and work the control of which period and the control of the

but this was not confirmed by the Council of Chairmen.
Preapments and Klerkeren (573, Pressia,
p. 1082), for an excellent description of vestings of cotton
warp, with weft of carded and combed wool, worked

with slik checks, of varied and good designs. PM BROTHERS and Co., Dublin (255, p. 49%), for excellent specimens of poplin got up with great carefulness and evenuess of make. There are some on the Jacquate, figured of single colour, worthy of particular notice, and one expecially worea with Sur colours highly descring

of merit for perfection af make and design.

(ROCKTROM, E., Vienna (10.8, Austra, p. 1022), for good apociment of waitestanting of cetten and wood, with good apociment of waitestanting of cetten and wood, with They are sold at the love piece of 1s. 7d., and, in this respect, the merit af the exhibitor entitles him to reward. STRIPT and HAMARAM, Forbandin (16.1, Priessis, p. 1087), for a variety of imperior restings of silk warp and cotton effect, at very moderate priess. They also show was certainly not considered in the contract of the

pictures of Jacquard imitations of engravings. Their productions are of high merit. TAYLOR, J., and Sos, Newsome, Huddersfield (111, p. 490), for vestings of great variety and superior make.

The cashmeres are of good taste and high aeril. There is among them a novelty of good invention, being a variegated cloth of cotton warp, figured and shat with goats' hair, styled Tiger. The faliries of this house are of the bighest merit, and in the opinion of the Jury entitled to the award of a Conneil Medal; but this was

not confirmed by the Conneil of Chairmen. Træ and Sos, Barnely (37, Closs XIV., p. 312), for a variety of finites of excellent quality, distinguished both worthy of merit, being the introduction of a new material called China grass. a substance which has larly been pun by Mears, Markall, of Leeds. The employment of this new thread in vestings and pantaleon obthis gives Torston and Sosson, Bullon, Hadderfield (116, p. 490). Torstow and Soxos, Dalton, Hadderfield (116, p. 490).

To ssox and Soxs, Dalton, Huddersfield (116, p. 490), for an excellent assortment of vestings and other articles af superiar quality, among which we particularly distinguish some Scotch designs, with silk and wood, brilliant and cheep. There is also a lady's cloth, lightly drossed, af particular merit. Their fubries generally are of high merit. Medal awardel in Class XII.

Walmsplett, H., Fallsworth, near Manchester (51, Class XL, p. 483), for poplins at a new and cheap description, with several other fabrics of excellent character, showing great ingenuity. WRIGES, J. J., Ludwigsburg (29, Warth-mburg, p.

WEIGLE, J. J., Ludwigsburg (29, Wirthenburg, p. 1115), for a fabric of restings of cetton, carded wood, plnin, and crossed with tilk, an excellent description of valentia well manufactured. Medal awarded in Class XI.

The Jury make Honourable Mention of the following Exhibitors: -Asen, T., and Sovs, Halifax (107, p. 491), for panta-

loon cloths of cotton and gonts' hair, and light coatings, wery well manufactured, and of very good colours. Racmovers and Vollschwitz, Zerbst (850, Prussia, p.

1095), for silk and cotton plush, highly esterned for the hinings of caskets. (Awarded in Class XIII.) B Annoza, J. (683, Portugal, p. 1315), for excellent fabrics for pantalous, of good manufacture, strong, and

printing read promine of equality with the productions of other countries.

Bassarr and Co., Abing-lon Street, Manchester (185, p. 4°5), for speciment of Utrecht velvet. One design in refief, made in the Jacquard loom, is well worthy of notice; more, however, for the happy idea than for the excellence of its execution. Credit is due to them for

the introduction of the article, BoxTr, L., Bouloix (33, France, p. 1172), for pantaloos stuffs of cotton warp, shot with wool, of well-chosen colours and good materials, at prices suited to the working classes.

ing classes. Braa. and Witsox, London and Bradford (12, p. 480), for waistecasings of wool called backskins, being a kersymere of very fine texture, cultivathered with slik by children of twelve years of age. The work is of remarkable beauty, particularly in its character.

BURGARANT, H. T., Crimmitzschan (109, Saxany, p. 1100), for light cloths, cassincts, the qualities and colours of which are good.

Cocu, A., 58 Faubourg du Temple, Paris (125, France, p. 1177), for vestings of cashmere design, af good quality, and well-assorted colours for general consumption.

Dantaz and Co. (855, Portugal, p. 1315), for most creditable goods of various kinds. We nuticed waist-

coatings in the Scotch style, made of wool, catton, and silk. (Honourable Mention awarded in Class XIX.) Far, W., and Co., Dublia (267, p. 499), for furniture pieces, manufactured in a superior manner; also far some

fair specimens of dress pieces plain and figured.

Gausex and Bosser, Tournay (241, Belgium, p. 1158),
for specimens of pantaloon stuffs of lines warp, strong,
useful, and cheap.

Ilass, G., 6 Rue de la Villère, Paris (263, France, p. 1189), for vestings of considerable excellence of manafacture.

LEMBANN, D. J., Berlin (126, Prassia, p. 1055), for specimens of plush and woollen velvets, plain and printed. We also noticed some in two colours made on the Jacquand, after French designs. The manufacture is good and the colours well chosen.

LEVIN, II., SONS, Berlin (114, Prussin, p. 1054), for vestings af a similar description, also worked with wool and silk on the Jacquard. Their goods are of excellent

Max METER and Co., Berlin (133, Pressia, p. 1055); for sik nod cotten plush, of excellent quality. Pressurences: Biorranas, Gladlach (574, Prassia, p. 1082), for light elohs, called cassinets, with contour warp and carded wool weft. The manafacture is good and price moderase.

REFIGURE and SULEXET, Lyons (1432, France, p. 1244), for goods almost entirely composed of silk, and perhaps belonging to Closs XIII., but we find some variateoutings of silk velvet shot with cotton, and some poplins of good quality; the waisteants being in particularly good taste, (Princ Medal in Class XIII.)

REFIGURE W., 81 Grafton-street, Dublin (266, pp. BERYSOLES W., 81 Grafton-street, Dublin (266, pp.

RECEOUDS, W., 81 Grafton-street, Dublin (266, pp. 498-99), for poplins for furniture, manufactured in a

superior manner.

RENEARS and MECKEL, Elberfeld (580, Prussia, p. 1082), for vestings distinguished for their moderate cost, Cotton warp shot with silk and cotton made an the Jacquard, some of popin and satined descriptions.

quality, some or popul and standed descriptions.
Senontian, J., Rastrick, Hindder-Seid (125, p. 490), for
pantaloon cloths, vestings in wool, silk, and cotton, and
kersymeres called "patent Britannies," all of good
quality.

SCHELTE, J. H., Burmen (675, Prussia, p. 1087), for valentius and cashinere designs of good manufacture. Thendel, jun. (41, Bavaria, p. 1100), for specimens of light puntalson stuffs of cotton and wood, of excellent make, good taste, and moderate price.

WILLETT, E. NEFBEW, and Co., Norwich (310, p. 501), for paramattas and bombazines of excellent quality.

B.—Shawer. General Ecouries. Kasemin Shawes from the East, and Imitations

The superintry of the woollen fabrics of Kashmir is to
be found recorded in many anciest custom works. In
be found recorded in many anciest custom works. In
place at the policies of Gonte-bullinia, the related of the
Pauda princes, about the period of two humalized years
before Chrat; it is stated." "that the people of Kancheis
(the morthern districts currounding Kashmir) brought
wood, and embeddered with gold, being, in fact, sharris

and brocodes Again, in the Ayeen Akbery, being the institutes of the Emperor Jilaledsteen Mohamed Akbur, sixth in descent from Timur (Tamerlane the Great), proclaimed emperor in 1556, we find the following interesting necount of shawls :- "His Majesty has ordered four kinds of shawls to be made: 1st. Toos affee (grey affee), which is the wool of an animal of this name whose natural colour, in general, is grey, inclining to red, though some are perfectly white; and these shawls are incomparable for lightness, warmth, and softness. Formerly they were made of the wool in its natural state, but his Majesty has had some of them dyed, and it is surprising that they will not take a red colour. 2nd, Sufed alcheh (white alcha), which they also call terclular. The natural colours of the wool are white or black, and they weave three sorts, white, black, and grey. Formerly, there were not above three or four different colours for shawls, but His Majesty has made them of various haes. 3rd, Zerdozy and others,; which are of His Majesty's inven-4th. From being short pieces, he had them made long enough for jamels (gown-pieces). The shawls are classed according to the day, month, year, price, column, and weight; and this manner of classing is called missel. The mushrifs, after examination, mark the quality of each apon paper affixed to its corner. All those brought into the palace on the day Ormand of the mouth Ferirdia (10th March) are preferred to those received afterwards, of the same floeness, weight, and colour, and each is written down in order. Every day there are received into store the following kinds, and from this account of

one day may be formed an iden of what is done in the

Foreserfy, shawls were but rarely brought from Krabmin, and those who had them melt to wer them over the shoulder in four fields (vide ancient sculpturm), so that they haded for a long time. It is Majery has no that they haded for a long time. It is Majery has the other, which is a considerable addition to their beauty. By the attention of Illi Majery the insumfacture in Keslmir is in a very flourishing state, and in Leafest there are upwash of a thousand musificative of Leafest there are upwash of a thousand musificative of with the vary of silk and the word of wood, and this hild is called neares. Of both kinds are made term

bans, &c." With this account before us, it is reasonable to suppose that varieties of every kind were introduced about this period; and the evident encouragement given to these inprovements doubtless tended much to the progress of this trade, while these showls continued to be a favourite article of dress, during the Mahommedan dynastics in particular. After their decline, it is probable that the troubled state of Upper ludin, and the general turbulence of the mountain character, had its effect in retarding the progress of a trade involving the labour of so many hands; but its absolute necessity as an article of wearing suppose to every well-dressed native of India, Persia, and parts of Turkey, effectually prevented the manufacture from fulling into decay, even at the worst of times. It was open said that there were upwards of 30,000 looms at work; but Strachev, who visited the country in 1809, gives whole produce was estimated of 35 lacs of rupees, but Mooreroft, who was there in 1822-23, says it had deelined to half that sum. A renewed vigour has been instilled into it within the last thirty years by the constantly increasing demands of the Paropean markets; and the present improved state of coverament, of social rights and intercourse, in that part of India, will of course add greatly to the energies of a persevering and pains-taking people, and will most probably give curly proof that its resources have never been fully developed. The valley itself is now in the hands of Golab Singh, a chief who fully appreciates the value of the trade; but many of his measures are oppressive to the manufacturer, and some of the best makers are finding it to their advantage to settle in the neighbouring elties, under the British Government, where they are able in perfect freedom to push their trade to any extent. Unritzer and Labore are already showing rapid progress in this trade, and there is no reason why their productions should not equal in all respects those of Kashmir; while the demand for Europe is actively promoted by European agents residing there, for the express porpose of encouraging perfection in design, colour, and texture. The activity of the present trade may be estimated from the following returns, procured from the firm of Kipley and Brown, the leading

brokers in this trade:-

of the first introduction into France of the ta-te for this article of dress, and of their first importation from Egypt, where undoubtedly they had found their way from the custern emporium, chiefly through Persia. In Empland, however, the fashion had been earlier introduced by those connected with the East India Company's trade, and they were included in the periodical sales of prohibited goods, held at the East India House as early as 1750. In 1787, we find they were admitted by our Custom-house, up-ur payment of an od roberes thaty of 274 per cent, which duty has since been thus changed, by various acts and - £81 2 11 per cent.

and Alderman Watson, of that town, succeeded in wearing the first Justina style of shawl we believe ever made in Europe. The process was too slow and unprofitable to

induce them to contione their operations; but Mr. John

Harvey, of the same town, followed up the enterprise with Piedment silk warp and fine worsted shoot, the designs eing worked in by a process of darning by the hood. No great progress, however, appears to have been made in this tedious and expensive process, and not till 1805 was an entire shawl produced from the loon in Norwich. In Paisley and in Edinburgh they took up the monufacture about the same time, but the former town has alone retained it, making India imitations now of real Kashmir wool thread, at very low prices, to a large In 1802 a commencement was made in Paris; and it is related that the enormous expense of 60,000 frances, expended in setting the loan prepared for the purpose, induced the immortal Jacquard to invent his wonderful process of working intricate designs with facility. 1819 great success had been reached upon looms h la Tire, with Kasimir wool imported for the purpose, and spun with great skill in France. Not earlier, however, than 1834 was the present process, called sponline, which is the exact initation of the Kashuirean, so introduced for working intricate designs that one man, with a Jacquard loom, can produce the excellence now attained in In fact, we find the true Indian shawl there produced, but perfected by the addition of nuclinary, and sold at about a quarter of the cost in India, their range of prices being, for squares of full size, 25 to 600 france, and for long shawls of full size 50 to 150st frances: 4,000,000 frames is given as about the value of the total production of these fulries in France at the present time; that of Scotland cannot so easily be estimated, but it is very large, though the shawls are chiefly of a cheaper description, ranging from 7s. 6d, to 3d, per square, and 1d. to 15d, for long slawly. We have dwelt thus at length upon the productions of France and England because of the greater development of the manufactures in these

in the eyes of those who can afford to pay it. The fines descriptions cannot be purchased in the valley under 300 to 1,500 rupees for square, and 450 to 2,000 rupees for long. Particular Remarks. We find the following number of contributors of the descriptions called "woven," se printed," "cubroidered," and "tortans: "-

at command, and such ingenious and industrious artizans,

they may soon vie, in cheapness at any rate, with either

of their predecessors in the trade. There is a peculiarity

in the character of a real Kashmir shawl, as well in originality of design as in solidity and darability, which, notwith-

standing the energous difference of cost, will retain its value

Among whom we proceed to notice those who are most worthy of remark.

1. WOVEN SHAWLS.

The HONOURABLE THE East India Contant has contributed to this Exhibition such a costly and gorgeous display of the very best specimens of every descri of mnumfactures within their dominious, each in its kind so choice and perfect, and of a taste so original, as to afford example to all Europe, that as exhibitors of the most distinguished character we cannot but recommend that their deplay should be suitably recognised by Her Muissta's Commissioners

There are many articles which do not strictly come under the cognizance of our Class, but it has been conidered preferable to combine as much as possible the Report upon this collection of fabrics, rather than scatter e notices upon each different substance among many

We proceed to notice particularly,- -

From Kashmir, a square shawl of perfect design and tissue; two long, fine white ones, of beautiful texture, and others (p. 915), presented by Мананалан Golan Sasan; some pieces of superior shawl challs, called kid cloth, and Purrepus; this is looped in the west at the lnck.

From Indore, shawls and embroideries, and other articles, by Maharajan Rao Scindean (pp. 915 and 916). From Pattenlia, shawls, scarfs, and rich tissues, by the RAJAN OF PUTTEAULA.

From Loodinia, shawls for cheapness of price From Beurres, splendid brocaded shawls and scarfs, from Badoo Deo Nabayn.

From Ahmedahad, the same description of goods. From Moorshedshud, the same, with some gold prints, From Indore, the same. From Madras and Bengal, beantiful embroidered mus-

countries, where it had been first introduced; but we find lin scarfs and shawls, of remarkable texture and elegant that within the last five years Austria, the States of the Zollverein, and Belgium have been setting their looms From Bengul, a very curious white muslin shawl-scarf, upon similar produce; and with such excellent material

worked with gold, in which the turning of the shuttle shows extraordinary skill, From Deca, two shawls, embroidered with gold and

silver needlework; executed for Her Majesty. Some elegant searfs, embroidered with coloured silks of Sherry; oriental tect From Delhi, some splendid specimens of needlework

From Abmedahad, a curious specimen of chall of gold, worked by hand; exhibited by Mr. Charles Copland. From Kashmir, a aplendid shawl, worked in many colones with gold and silver; exhibited by the PENIN SELAR AND OBENITAL STEAM COMPANY. A very hand A very handsome long shawl, called an Alvandar; exhibited by Mr. JOHN GRAHAM.

It would be endless to point out all the excellencies which this portion of the Exhibition puts forth. The called the correct list of them, for all of them are worthy of notice, and will, no doubt, afford to manufacturers of

all nations a means of finding that they have still something to learn. CLARBURY and Son, Norwich (284, Classes X11, and XV

p. 500), are exhibitors of the very first-class shawls of a similar style and perfection. They also present poplins, paramattas, and a variety of beautiful fabrics of the highest order. The fabrics of this firm are remarkable for their perfection of manufacture, and good taste in design, for their variety and novelty, and for all those qualities which characterize first-rate manufacturers; but a member of the firm being apon this Jury, their productions are not under our review for particular distinction GAUSSEN and Co., I Rue de la Banque, Paris (1242. France, p. 1237), have furnished a selection of very beautiful shawls of ludian wool, got up in the most perfect and classic style. Their manufacture is of the highest class; but the leading member of the firm being upon our Jury, they are out of the pale of competition,

Moroax, Jonx, and Co., Paisley, Scotland (299, Choses XII. and XV., p. 500), have contributed a fine collection of showls of the highest character for design and monufacture. They are dyers of their own yarn, and dressers of their own produce, and are in all respects namufacturers of the very first repute; but the senior member being upon this Jury, their goods are not under consi-

deration for any Prize distinction.
WERDER and HAIRS, Loudou (277, Classes XII, and XV., p. 499), have exhibited a great variety of printed showle of excellent taste. Mr. Hairs being, however, an Associate Juror, their goods do not come under Prize consideration.

Com-il Model,

DENEIROUSE, E., BOISGLAVY, and Co., 16, Rue des Fosses Montmartre, Paris (1182, France, p. 1234), for a long white shawl, made precisely upon the same prinlong white shaws, mane prevery upon the come pan-ciple as thuse of Kashuir, and distinguished by the elm-racter of "snouline." This shawl is of peculiarly fine texture and design, combining natural flowers, in all their various tints, with the style peculiar to India: it is per-fect in all respects. There is also a long white, of a new and original design; it is remarkable for the introduction of a new process, adapted to the Jacquard Ioom, by which, with the usual colours, a great variety of tints may be made by combinations of different threads in the welt. This is a new and important discovery, which, added to the excellence of their manufacture, in all rest tles these exhibitors to the recommendation of the Coux-CIL MEDAL, and this award was confirmed.

The Jury award Prize Medals to the following Exhibitors:-

BERGER, JOSEPH, and Sun, Vienna (209, Austria, p. 1022), for a highly creditable collection of almois of elaborate style, a long ane in particular with variouscoloured compartments, and a square of Kashniir wool worked with gold, are deserving of great merit for good taste and colouring; others of entire wool are highly creditable for their moderate cost,

BLAKELY, E. T., Norwich (285, Classes XH. and XV., p. 500), for a square showl of purple ground with many omportments, of various colours, in which gold is introduced, perfect of this particular school. The Barrege scarfs are of superior quality and novel taste. His goods are of the highest merit.

HLISS, WILLIAM, Chipping-Norton, Oxfordshire (270, Classes XII. and XV., p. 429.; for a variety of shawls, made from different materials, and of great merit for the adaptution of new articles for to-sac, such especially as vicada, which is here shown to great advantage; he is an enterprising manufacturer of great merit.

Boas, Ilnorusus, Paris (68, France, p. 1174), for shawls of a very particular style, and of extraordinary composition; we notice in particular a long white of curious design and colouring, which possesses much eri-

ginality, and is well assunfactured. Their shawls are of Indian wool yers, and deserving of a high degree of

Dantson and Co., 6 Ree des Capucins, Lyons (1167, France, p. 1233), for a collection of fine wool shawls of good style and make, and at very moderate prices

Decase and Co., 1 Rue St. Petits Peres, Paris (1592, France, p. 1263), for great general excellence. This firm manufactures the largest quantity of fine shawls in France, and has exhibited the greatest variety of rich specimens in this Exhibition. They are of superior unker and design. We particularly call attention to a long white shawl, of extraordinary manipulation, manufac-tured entirely of Indian wool yarn, and the finest ever made, having 320 shoots to the inch. Another long white, of new and original aspect: the inner border is formed by double grounds, shaded of different tiats, gradunting from the durkest to the lightest; the colours, being clear and distinct, show the design in all its perfec-Gold and silver threads are used both in warp and weft, to increase the number and brilliancy of the tiuts. There is also a square, with different compartments of various colours and ground, of very perfect design. We considered that the Council Medal should be awarded to this Exhibitor; but this recognizedation was not confirmed by the Council of Chairmen. The productions of this house are of the very highest order of perfection, combining excellence in material, manufacture, colour,

and design, with much originality Forms and Heremison, Paisley (291, Classes XI). and XV., p. 500), for cheapuess of amoutacture and ge-

aeral excellence. GARSSEN, FARGETON, and Co., 2 Place des Victoires Paris (1243, France, p. 1237), for a variety of shawls of ludin wool, with very elaborate effects, and of superior assunfacture. We notice particularly a long white on minufacture. We notice particularly a long white on two grounds, in which there is excellent harmony in colourney and design; again a square white of very rich style and enceful manupulation. In all there is great

GRILLET and Co., 11 Place Croix-Paquet, Lyons (1259, France, p. 1237\, for two long showls of very elaborate worthy of particular notice for novelty and harmony; their known superiority of manipulation gives rise to regret that they have not exhibited a greater variety HEDGUT, F., and Son, 13 Rue du Mail. Paris (162)

Prance, p. 1255), for sluwls woven from Indian wool yarn of the very first class, being a classic and humo-nious imitation of the Indian style. There is a lung one with ground of four colours, very successful in its colouring; a square number colour is very time to its Indian origin; and altogether this firm is decidedly worthy of merit for its cureful products.

KERR, HORART, Phisley, Scotland, and of the firm of Kerr and Scott, London (200), Classes XII, and XV., p. 5600), for remarkably fine specimens of every description of shawl, in all textures, all of which are stanged with the character of superiority, and the highest degree of skill in manufacture. We considered his goods to be precurrent in design, novelty, variety, and texture, and accordingly recommended him for the Council Medal, which the Council of Chairmen did not, however, grant, LION BROTHERS, and Co., 9 Place des Petits Peres, Paris (1327, France, p. 1239), for a handsome collection of shawls, of elaborate design and excellent make; a long white is well worthy of notice. There are two squares of peculiar style, in which the white and yellow effects are produced by gold and silver thread. Their manuare is of distinguished merit.

Mentas, A. and V., Government of Risson (281, Euroia, p. 1375), for a long white slaw) made of face wool, complexous for its heautiful texture, and for a landsome border of modern thoral design, quite original, which presents the same effect on each side of the show), the centre being sewed in according to the Indian manner. It is a novel and extraordinary production of high merit, and though scarcely to be considered an object of trade, it may lead to one of importance hereafter

ROBERTSON, J. and J., Paisley (301, Classes XII. and

XV., p. 500), for changess of manufacture and general | 2. Smanls or Ranige, Chare, Gauze, Silk, and other excellence.

TOWLER, CAMPIN, and Co., Norwich (309, Classes XII and XV., p. 501), for a very choice collecton of long shawls, of different compositions of spins silk and wood. They are of claborate and original designs, showing superior skill in workmanship, and the highest degree of ment a manufactorer can attain. Every improvement is here adopted without abandoning the distinguished character of the original Norwich style. We tind also printed shawls on a grenadine gause of great merit, and a square with silk worked on cashmere ground, very beautiful, All their productions show great perfection in a school peculiar to this town, and always to be admired, and they are of the highest degree of merit. We therefore recom mended a Conneil Medal to these exhibitors; but it was

not conceded by the Conneil of Chairmen. ZEINEL, J. and J., and C. BLUMEL, Vicuna (320, Austria, p. 1022), for a collection of shawls, among which a long white of woollen warp, and another with four compartments of elaborate French designs in good taste, made of Cashmere wook, are worthy of particular remark for excellence of manufacture. Others of more moderate cost are also deserving of great merit, showing much perfection in the working of their woollen thread.

The Jury make Honourable Mention of the following Exhibitors:-

BONFILS, SOUTHAZ, and Co., 3 Ray des Fossés Mentmattee, Paris (1094, France, p. 1230), for specimens of shawls of excellent design and min offerture; we point in porticular to a long one with pink ground and orange compartments: a very successful constitution, and pos-

sersing much novelty, Chambellas, G., and Co., 8 Rue des Foorés Mont-martro, Paris (1140, France, p. 1232), for a collection of shawls of superior manufacture from Indian wood yarts;

in particular a long one of excellent design, and a square in four compartments, are well worthy of notice CHINARD, CHARLES, 9 Rue de Cléry, Paris (89, France p. 1175), for a collection of shawls of very good make and careful combination of colours; particularly a new style of square adapted for annuncr fashion, differing from the

Ordinary method of wearing.

Harry, Jony, and Soy (58, Classes XII. and XV. p. 488), for some peculiarly soft fannel shawl-, me ats' hair, the produce of stock reared by H.R.H. Prince

Albert in Windsor Park. HAYDTER, SERASTIAN, Vienna (311, Austria, p. 1022). for moderate-priced goods, and very erestitable specimens of long shawls of good effect, at from 40s, to 45s., and a

black square at 24., which are decidedly cheap.

MARY and WEILERT, Berlin (113, Prassis, p. 1654). for a collection of long and square shawls on spun silk warp, with wool and mixture weft; of good design and y effective, and of moderate prices

OFDENHOFF and HARTENG, Herlin (134, Prussin p. 1055), for several harness shawls, as well as tartaus, o good taste and manufacture; their colours are few but

eff-ctive, and prices very moderate, Ptn-Bayaso, Ronbais (682, France, p. 1211), for a collection of damask worsted shawls, of peculiarly soft texture and excellent make: when their moderate cost is considered we cannot but give him much credit. (Prize

Mechl awarded in Class XII.) REINHOLD, W., Vicuna (315, Austria, p. 1022), for a variety of long and square shawls of very good taste in colour and design, and for effective goods at n low price,

Riss, Joseph, Vienna (316, Austria, p. 1022), for simula of a low quality, presenting them solely for merit as to eheapness. Roxnenger, Jones and Annew, Paisley (296, Clauses X11. and XV., p. 500), for specimens of woven showls,

of good designs; also shawls made on spun silk warp, in which an ingenious advantage is taken of short reeding in design, which reduces the expense of production SARIN, REBEYRE, Lyons, for a good assortment of erasearfs, square and long shawls, of good colour

and design, chiefly suited to a large consumption at low prices.

DESCRIPTIONS. General Benser by

The mpid progress in the manufacture of showls, and the increasing taste and demand for this style of garment, has led to the introduction of many kinds of lighter falcies, in either wood, sak, goets hair, or the various combinations of these with other materials, such as cotton, spun silk, &c.

These descriptions are generally traded in under the following demonituations

Crapes, made of sell, in initiation of Chinese fibries; chiefly manufactured at Norwich and Lyons. made in the Pyreness, by the pensantry of a place so named; remarkable for their lightness, elasticity, and strougt

Another sort, with silk warp, and with a check of silk; a new introduction for increasing the effect of printing. Greundines, made of silk of a peculiar twi-t, while ives lumbuess and durability, but at the expense of

Levastines and Albanians, made of silk and span silk, in imitation of the scarfs from various parts of the Medi-

Chemile, a novel application of silk, sometimes with

Chird, a printed warp before weaving, The trade in these articles has already in a few years

become noot important, giving employment to an immerce number of artisans in various branches besides these of spinning and weaving, such as designers, carvers, chemi-In the perfection of these goods, France has taken the

lead, and to her early encouragement of schools of design, and well-known national taste, may be attributed the tone and fosition also has given to all Europe ; but her work is re expensive than that of England, and large quantities of these goods are brought over to be printed here at tho lower cost, which the greater division of labour and the more extended development of the trade has accomphylical.

In these printed articles, Austria shows evidences of ou active endeavour to produce imitations of the designs of In the exhibition by the States of the Zollverein we also perceive the foundation of a future trade in these fabrics.

Particular Remarks. The Jury award Prize Medals to the following Exhibi-

tors in this department: Chocorres, Frank, Paris (1148, France, p. 1233), for reat excellence in the printing of light showls. For a great excent ree in the praining of light shows. For a long time foreman to his brother, he has nequired much of his perfection. We point especially to a long white showl of elaborate design, the entting and printing of which prove him to be a manufacturer of great merit. CHOCGEREL, LOTIS, Labricht, pear St. Denis (90, France, p. 1175), for a collection of printed shawls, on barege, enchemire d'écosse, and other finey goods, of great excellence in design, harmony of colours, and perfection of printing, which is conspicuous in the great clearness of his white grounds, the whole being of the very highest merit. Medal nwarded in Class XVIII.

Ganx and Mclypor, Glasgow (279, Classes XII, and XV., p. 499), for the economical execution of the printed shawls exhibited by Messra. Keith, Shoohridge, and Co. KEITH, SHOOREIDGE, and Co., 124, Wood Street, London (279, Classes XII. and XV., p. 499), for a large col-lection of printed shawls, searfs, and mufflers, of excellent design and execution. They are deserving of merit for the goods they have made up on their own designs. But to Glen and McIndoe, Glascow, their printers, we consider much credit to be due, for the execution of the detail, which for colour and neutness is very remarkable.

SWAPSLAND, C., Crayford, Kent (283, Classes XII. and XV., p. 590), for goods that prove him to be n printer of the very first class. We point especially to an elaboration.

rate design on a barège ground, which has required 550 blocks to complete the pattern. The colouring is bright and clear; the execution perfect. At his extensive works the art of printing on wool has been carried to great ex-

THIRRY-MEZO, Mulhouse (1506, France, p. 1248), for a large collection of shawls, square and long. The designs are of classic style, clearly and neatly executed, and the sharpness of outline well preserved. The goods are cheap,

nul of decided merit. Towlea, Campin, and Co. (286, p. 500), and E. T. BLAKELY, Norwich (285, p. 500), are both maunfact and exhibitors of first-class printed goods, but have reecived their awards of merit under the head of woven

The Jury make Honograble Mention of the following

Exhibitors :-DEPOULLY BROTHERS, BOLVAUX, and Co., Paris (1586, France, p. 1232), for a good selection of burdge shawls, printed with taste and accuracy. The colours and compo-sition do much credit to M. Boivaux, the designer.

Gonzenov, LEON, Purtenux (1252, France, p. 1237), for a few specimens of shawls printed on fancy burdge,

with dark grounds of great perfection in clearness and precision. He is a printer of the first class; but having a larger collection of dresses than of shawls, he will be more particularly noticed elsewhere.

JAMESON and BANKS, Honey-lane Market, Cheupsid London (278, Classes XII. and XV., p. 499), for a large collection of superior shawls on various grounds, some with novel floral designs, executed in the most perfect manner, and printed by the first men in the art; such as Swaisland, Littler, and David Etnas and Co.

LAWSON, J., and Co., Calculouis Print Works, Paisley (294, Classes XII. and XV., p. 500), for excellent speci-mens of printing, of good effective and clear designs, which are moderate in price.

Lewis and Allersin, Regent Street, London (276, Classes XII. and XV., p. 439, for a design of their own composition of peculiar Indian style, very classic and effective; printed on several grounds by Swaisland in a superior manner.

LITTLER, MARY ASS, Merton Abbey, Surrey (282, Classes XII. and XV., p. 500), for shawls of Indian style, designed and executed by herself, showing great executed.

lence in the art of printing. Medal awarded in Class 3. SHAWLS, EMBROTHERED WITH WOOL, SILE, TERRAR, GOLD, SILVER, &C.

Graced Branche. There is no doubt of the origin of this description of manufacture being traceable to eastern nations, where, in truth, we still find the most perfect workmanship and the greatest variety of design, with perfection of colouring, There, magnestionably, all uses of the embroidery-needle have been learned. The web of Penelope was no new thing in her time to the nations farther cast. The Is nelites were enjoined to have the door of the tent of their first tabernacie a " hanging of blue and purple, and senshet and fine twined lines, wronght with needlework."

Debrail, in her song of triumph, 1296 years n.c., sings of the "pery of divers colours of needlework, of divers colours of needlework on foll: \$\delta \cdot can be needed of the natiquity of enducodery.

exquisite work of this kind, ausarpassed by that of any other antion. We recret that nothing has been sent from Japan, where it is understood that embroidery is carried that Russin has derived her exerdence; the specimens colored on this occasion not being shawls, will, we trust, be noticed in their proper Class. India stands pre-eminent in the exhibition of embroidered shawls, whether in coloured wool or sitk, upon Kashmirs, cloths, or in gold and silver brocades; in short, in almost every variety of form or description.

* Exelus, chap xxvi , v. 36. † Judges, chap. v., v. 33.

Persia is not fairly represented on this occasion, for she has artisans of the highest ment; witness the beauty of her carpets, a species of embroidery in the manner of their manipulation; and she could have sent some excellent shawle, scarfs, and roomals.

Turkey has given a very handsome display of the excellence of her manufactures, and of the richness of her taste in embroidery of every kind; but her shows do not evince equal talent or originality, being mostly copies of Indian designs

Greece exhibits only some gauge searfs, worked with tinsel. She does not appear to maintain the character she formerly held for this kind of work.

Egypt shows no originality in this fabric; her silk and gold scarfs are not of a fine character, and are of the same description as those of Turkey.

In Paris, Paisley, and Vienna the embronlery of showls and scarfs on various materials is carried to great perfection; but the demand for such goods is not very great, the process being naturally expensive.

Particular Leworks.

Terler.-The Government of Constantinople have placed on view a valuable collection of embroidered scarfs and roomals (handkerchiefs), of superior taste and fabrication, fully maintaining the renown of Levantine manufactures. The shawls are searedy equal in character for excellence. There are some kumeabs, made at Damascus, worthy of remark; also some Albanian searfs, of cotton cloth mixed with silk and timed, made at the Imperial factory; not without merit, considering the difficulties attending the

introduction of machinery into that country. Altogether, the collection is a valuable exhibition of the progress of manufactures in Turkey, and worthy of the most Honourable Mention Labra - The East India Company's collection has already had special notice. We however point particularly to the gorgeously-brocaded square shawls, and the long red shawls embroidered with gold and pearls; to the mislin searfs embroidered with gold thread and beetles' wings.

It would be tedious to mention the various excellencies, as all are of the very highest order of merit. The Jury award Prize Medals to the following Exhi-

bitors :-Foulques and Co., Paris (1603, France, p. 1253), for net shawls embroidered with silk, rich, elegant in design, of sovel character, well executed, and quite worthy of the Prize Medal. (Medal awarded in Cluss XIX.) GRAHAM, JOHN, Ludgate Street, Loudon, curbroidered

crape shawls of peculiar excellence in texture, colour and design. They are probably the finest specimens ever becought from Chima, and of the highest possible merit. We hold the Evhibitor to be worthy of the Prize Medal

as the jurporter Laroura, H. F., Vienra (387, Austria, p. 1029), for subconderies on several textures, most of which show great skill in that art, and a perfect adaptation of material to colour and design.

WHITEHILL, M., and Co., Paisley (287, Classes XII, and XV., p. 500), for superior merino shawls embroidered with silk, of which the taste and execution are conspicuous, proving them to be manufacturers of high

The Jury make Honourable Mention of the following Exhibitors :-

We have from China some specimers of the most HENRY, EMFNEZER, and Sons, Glasgow (13, Class X1 p. 480), for a good selection of embroidered merines, of good taste and execution.

Mair, Joun, Son, and Co., Glasgow (59, Class XI. p. 4823, for a good selection of embroidered merinos of good taste and exerntion. (Medal awarded in Class XIX. SIEBERT, FREDERICK, Vienna (271, Austria, p. 1020), for well-executed embrooderies.

4. TARTAN PLAIDS, SHAWLE, SCADES, General Bemarks.

This poeuliar manufacture is of very pocient date, and many learned researches have been made to endeavour to trace its introduction into the British isles, and into Scotland in particular, where it has so long remained the well-known national costume, giving a name to its peruliar style that is universally adopted in every part of the world where the manufacture is produced or traded in. Great deficulty has been found in the derivation of the word Tartan: it does not appear in Gaetic, nor was it used in the Highlands, where the word Breachen was its equivalent, until the sixteenth century. The ancient bank invariably used the word Brauch or Breaclan in Scotland, Hryean in Wales, and Brencan in Ireland, where the dress prevailed from very early times. A woollen fabric of this description appears to be clearly traced from the northern tribes of Europe, very far east. In Russin. and among the Calmacks, it is common to this day; in Burmali, the chopiered design, although mostly in silk is the common dress of the country. There are strong evidences of its having been of Seythian wear; it may be fauciful to trace Tartau to Tarnarie origin, but it is curious to find the Arabic word Becton meaning "partycoloured." Livy describes the party-coloured woollen cloths of the Gauls, Germans, and Goths. Pliny, again, states that the dress of the Gauls was woven in squares of party-coloured fine wool. Dio, writing in the third century, describes the Britons in cloths of divers colours, which were called by their bards "Breach," or "Brea-chan." There is no record of their having been the distinctive dress of the clans of Scotland before the sixteenth century; but in a chartulary of Alerdeen, in 1269, the canons of the Church forbid the clergy to wear the party-coloured garments under the name of Type tries. This word was brought into use from Normania in the eleventh century, and may very probably be the origin of the word Tartan, for it is frequently used in reference to these woollen cloths of many colours. In the fifteenth century the records of the Royal Wardrobe give an item of expenditure, describing the rolours of these Tyretimes. In 1570 an aurient Scottish manuscript gives n list of the colours of the plaids of the dif-ferent claus. In 1747 the wearing of this distinctive dress was prohibited by Act of Parliament, and the grey shepherds' mands were nade instead. This Act was, however, repealed in 1782, but the fashion was not netively revived until very lately. The visit of George IV. to Seofland, in 1822, gave the first impulse to this revival, and in the neighbourhood of Stirling fancy plaid shawls began to be made. In 1828 clau Tartan shawls, anawis began to be unuse. In least the latest latest land and square, became very popular. The Galashiels weavers took up the trade very actively, and from that period the consumption has each year been greatly on the increase. Paisley opened extensive manufactories about eight years ago, which now throw off a vast quantity. The example of that town was quickly followed by France, Belgium, many parts of Germany, Amstria, and Bohemin; and in 1849 a very extensive concern was opened in Massachusetts, North America, for the production of this fabric from native wool, which has given evidence of excellence that will compare with any other country. We find also a specimen from Canada; but in this article it will probably be long before Scutland can be surpassed in design, fabric, or cheapuess.

Mongan, John, and Co., Paisley (299, Classes XII. and XV., p. 80), have a very handsome collection of tartans of very superior make; but, as already stated, Council Medal, which we trust will be confirmed.

they are not under consideration for distinction in consequence of Mr. Morgan being a member of the Jury. The Jury award Prize Medals to the following Exhi-

bitors in this department :-

Cases, William, 62 Queen Street, Glasgow (202, Chases XII. and XV., p. 500), for tartans of fine Iulian word, of superior make, the colours excellent, and the

Kean and Scott, 31 and 32 St. Paul's Churchyard, London (275, Chasses XII, and XV., p. 499), for a variety of tartans of the very test description, manufactured by Robert Kerr, the beauty of whose fabrica has already

been fully appreciated by this Jury.

LAWRENCE, STONE, and Co., Boston, United States
(464, United States, p. 1464), for n few tartans of excellent manufacture. fine in texture and bright in colonys. They are made from native wool, and show much excellence as the produce of a manufactory only three years at work, but estimated to turn out this year 5,000,000 pieces.

This concern, from its rising importance, is considered to be of decided merit, LEYS, R. and G., Galashiels, Scotland (192, Classes X11. and XV., p. 4955, present such perfect specimens of their manufacture that we cannot but consider them as nukers of the highest merit, and fully entitled to the

Prize Medal. PATON, J. and D., Tillicoultry, Scotland (466, Classes XII. and XV., p. 50t), for a collection of tarinas remark-able for their fineness and softness of texture, for the

excellence and variety of their colours, and perfection of Naxorason, R. and A., and Co., Galushicle, Scotland (196, Classes XII. and XV., p. 495), for an excellent collection of tartans; their mands, or shepherds' checks, are

particularly worthy of notice. Vax Dea Beren, J. C., Dasseldorf (Prussia, 494, p. 1079), for a collection of fancy turnan, with ends bro-ended, of peculiar style. The taste and excention are both superior; and, with reference to moderate price, this manufacture is considered to possess a decided merit.

The Jary make Honourable Mention of the following Exhibitors:

HARRIAUS, J. C., Soxs, Elberfeld (567, Prusia, p. 1082), for a good collection of medium-priced tarians, well made and of good colonis. They are extensive manufacturers. HOLMS, WILLIAM, and PROTRERS, 7 St. Mirron's Street,

Paisley (288, Casses XII. and XV., p. 500), for a con plete collection of clan tartaus, sixty-two in number, got up with great care, of excellent colours Wilson and Sox, Bannockhurn (468, Classes XII. and

To prepare the skins from the raw state, and reader them fit for organizatial dress, is the first process of the for drysser. In this country it is the usual practice to trample them in closed tubs with a little salt butter, luraing them over and over for several hours; by this means the skins are made into soft and pliable leather. The next operation is to rub them on the flesh side over a blast iron to remove loose pieces of integuments, and to reduce the substance, after which it is necessary to cleanse the far and skin completely from the grease; for this purpose, it is again trampled with sawdust (usually from malingany), which being braten out, and repeated several times, conduces to make the fire glossy and clean, and to fit it for the cutter to fashion into any shape that may be required.

The fur of most anionals is in its greatest perfection at the approach of winter, and before the animal has attained its greatest age. It is the object of the furrier, by dyeing the inferior skins, to imitate the more perfect specimens. Some difficulty has attended this process, as the nature of the skin will admit of the dyes being used only in a cold state, but the method which has been practised in Paris and London has been so far successful, that the remanence of the colour in the dyed sable is frequently and of equal durability to that of skins of the natural colour. Considerable excellence has been attained also io dveing tabbit and inferior furs of those colours which are more suitable to the novailing taste.

The several contributions of furs in the Exhibition, taken as a whole, form a complete collection of all the skins known to be used for ornament or dress; those of the Hepson's Hay Contany, and the CENTRAL CON-MITTER OF NOVA SCOTIA, are advaned with some of the choicest skins knowe to commerce; but our notice would be very incomplete if we postted to mention the remarkably beautiful and extensive collection of skins, and speeimens of taxidermy, furnished to the Exhibition by several members of the nobility and other gentlemen, under the superintendence of Messrs, Nictional & Son, of Oxford Street. We have also to notice the valuable articles exhibited by the same firm, on which the Jury ocade the following minute, 9th July, 1851:-

[The Jury having elosely examined the extensive and interesting collection of fars exhibited by Me-rs. Nicholay and Son, Her Majesty's furriers (301), as well as the large assortment of manufactured articles, of raceilent design and workmanship, resolve;-that they enosider them worthy of especial notice, and have pleasure in recording their judgment that the collection would fully entitle Messrs, Nicholay and Sou to a Prize Medal, quence of one of the firm being a member of this Jury.] We proceed to give a brief account of the animals that

are captured for their fur, the skins of which are exhihited in various parts of the Building, commencing with-The Russian Sable (Modele and for the This rich and beautiful skin has long been esteened one of the most valuable and useful fors that have been brought to our country. About 25,000 are assuably collected in the Russian territories, of which only a small number is im-ported into England. The fur is brown, with a me gree snots on the head. The darker varieties are the most highly valued, a single skiu being frequently sold for 9%, though the average value does not exceed 2% or 3% Antaralists. are not agreed whether to consider the animal form which the skin is procured as a distinct species. Some are of opinion that the Russian sable, the stone and pine martens, as well as the Hudson's Bay saide, are but one species, on which the differences of food and climate have produced some slight variations in form and colour. To the furrier, however, the Russian sable is easily distinguishable, from the length and fulness, as well as the darker colour of the fur. The use of this choice variety is necessarily limited to the wealthy, on account of its high value. In the reign of Henry VIII, by a law which sought to regulate the expenses of the different classes, and to distinguish them by peculiarity of costume, the use of the sable was confined to the nobility above the rank of viscount.

Hudson's Bay Salde (Most le Couelouis).—The sable skins next in repute to the Russian are those imported by the Hudson's Bay Company, of which no less than 120,000 are annually brought into this country. natural colour of the skins is much lighter than the prevailing taste, it is the practice to dve many of them a darker colour, and the furs thus treated are scarcely inferior to the natural sable.

habitations of mao, and presing on birds and the smaller animals. They are distinguished from the stone marten by the yellow colour of the throat; other parts of the skin are brown. When dyed, they have a similar appearance to the best sable.

Stone Marten (Mustela su como),-This marten is generally found in mountainous and stony places, though a frequent visitor to farm-yards and bomesteads. It is generally distributed through most European countries. The nuder fur is a bluish white, with the top bairs a dark lessus. The throat of this variety is usually of a pure white, by which character it is generally distin-guished. The Freuch minufacturers excel in dyeing

this for, from which circumstance it is frequently called Freuch salde. It is also dyed in this country, the excellent qualities of the skin adapting it to a great variety of purposes to which furs are applied,

Fisher, -There are about \$1,000 of these skins annually hrought to this conotry from North America; they are larger than the sables, and the fur is longer and fuller, The tail is long, round, and full, gradually tapering to a point, and quite black; a few years since it formed the common ornament to a national can your by the Jew merchants of Poland, and at that time was worth

from 6s, to 9s., but its present value does not exceed 6d. Mink (Models visus) .- There were 245,000 skips of this little animal brought to this country last year from the processions of the Hudson's Day Company and North America. The for resembles the sable in colour, but is

considerably shorter and more glossy. It is a very durable and media fur, and is expected in large quantities Ermine : Mortela erasinor .- This animal is similar in form and habit to the common wensel of this country;

but in Silecia, Russia, and Norway, from whence the skins are imported, the little animal, during winter, beskus are majorited, the little animal, during winter, be-cence as white as the snow, regions it inhabits, and is extremed as the whitest for known, though its summer does is a dinay brown. The tail of the skin, of which the lower lanf's jet black, is generally introduced as an ornament to the purely white far. It is worn on state occasions, and in the rejor of Edward III., its use was reatricted to the royal family. Fitch or Polecat (Mustela polocius),... These rkins are

produced throughout Europe, and in no place of better quality than in our own country. The ground of the fur is a rich yellow, while the top hair is a jet black. This fur is nt present very little used in this country, but is much worn in America. It is very durable, but the

difficult to counteract North American Skunk (Mephitis Assertions),-The

skins known under this name are imported by the Hudson's Fay Company. The animal from which they are taken is allied to the polecat of Enrope, and, from the fortor it emits when attacked, which has been known to affect persons with sickness at 100 yards distance, has received the soubriquet of "Enfant du Diable." It has a soft block fur, with two white stripes running from the head to the tail, which is short and hoshy. The skins, though imported into England in small tumbers, are usually re-exported to the continent of Europe. Kolinsky : Mestela Scherica), .- The Kolinski or Tartar

sable is of a bright yellow colour, and is sometimes used for ladies' dress in its natural state, but it is more frequently dyed brown to imitate other sable, to which it beers a strong resemblance. It is remarkable for the uniformity of its evicine, having no spot or difference of shade in any part of the ludy. The tail, which is of the same colour, is exclusively used for the best artists'

Musquash, or Musk Rat (Fiber 2Delhiess), ... The animal known moder this punce is found in great munifers North America, frequenting swamps and rivers, and, like the beaver, building its habitations of mud with great ingenuity. Dr. lichardson states, that it has three litters taken for the aulmal from which the musk of commerce is procured, which is a native of Tiber. About one million skins are brought to this country annually; the fur resembles that of the beaver, and is used by hat manufacturers. The skins are also dived he the furrier.

and manufactured into many chang and useful articles.

Natria, or Coypeu (Mypotamas capus).—This redent
quadruped is an expert assimmer, and frequents the neighbautrood of water, where it lives in barrows; it is mainler
than the beaver, and consideraby larger than the missmusab, but but a regenthance to both these animals into

bourboad of water, where it lives in burrows; it is smaller than the beaver, and considerably larger than the musquash, but has a resemblance to both these animale in its natural habits, and is the qualities of the fur. Until lately this fur was very much used by hat mannafecturers, and as many as 600,000 skins have been annu-

facturers, and as nany as 630,000 dkins have been annaly imported from Bueno Ayres and Chili, in which countries the animal abounds. Owing to the wars that continue to be carried on between the different states of Buenos Ayres, and the consequent withdrawal of the trappers from their accessioned occupations, the important of the control of the contr

of the hamster are annually collected in central Germany, where the animal abousday; it has a pore, short, and carne far, and is almost exclusively used for clouds hinge by the Girveia, it he colour of the beak is a reddis-levens, the colour of the six is a reddis-levens, and the colour about 9 inches in length, and lives noder ground, forming several parturants for storing grain agranted rens in sow hybernaciams. It is so industrious and providest, that when the peasants go 'hamster nowling' in the vinter, they possess themselves not only of the aline but of the exceed two bashley gain, where is and frequently to

Perwitaky.—The skin of this animal is beautifully marked like tortoiseshell, and is brought from the scatteneatern territories of Asiatic Russin; the far is short, giving little warmth, and is chiefly made into cloaklinings, and used by the Russians.

Beyer (Lutter foreviews — Beyer him are imported by the Hisbook hig Company in less quantities than formerly; the use of the far in our hat manufactured as a considerable depreciation has taken place in their value. In order to present the desirable depreciation has taken place in their value. In order to prepare the skin for that appropriation the course hairs are removed, and the surface is very evenly cut by an ingenious machine, somewhat similar to that the course hairs are removed, and the surface is very evenly cut by an ingenious machine, somewhat similar to that be a surface of the course
and chopmens. The white wool from the under part of the beaver still obtains a high price, and is largely exported to France, where it is manufactured into disdies boants. There is an obsolt that the beaver was formerly an inhabitant of the British Isley, and Pennant remarks that two or three waters in the principality of Wales still bear the name of Lluy yr aftage, or the Reaver's Lake.

Ditter [Left], volyová, Letra Ganalousio;—The large mpply of other skins used by the Rousian and Chinese in derived principally from North America. The quality of the first in most respects similar to the entre of the British Hele, of which there are about 550 skins collected manuly. This animal has frequently been transc, dan from the extreme apility in the water, has been rendered from the extreme apility in the water, has been rendered from the extreme apility in the water, has been rendered from the extreme apility in the water, has been rendered from the extreme apility in the water, has been rendered from the extreme apility in the water. Enropean, being about 5 feet from the nose to the tip of the tail 1.8 smaller variety abounds in the East Indies, the fur of which is very short. Sen Otter (Lohlydra marina).—The sea otter has a very thick, soft, woolly far, and is most highly prized by the Russians and Chinere, to whom most of the skins are

tincs, sort, worty mr, and a most nighty prized by the Russians and Chiesee, to whom most of the akins are exported. In its habits it is allied to the seal, but has never been met with is large numbers. It is found in the North Pacific, from Kamschatka to the Yellow Sea on the Astatic cousts, and from Allaska to California, on the Austrican coast.

The annual production is about 1,000 skins, of which

I by annual production is about 1,000 sains, or which

100 are imported into this country by the Hudson's Bay

Company.

Scal (Place).—There are numerous varieties of these animals, some of which are found on the western coasts of Scotland, Ireland, and Wales. They frequent, in immeuse numbers, the coasts of Newfoundland, Greenland, and Labrador, and the importations into this country frequently exceed 500,000 in one season. The young seals of some species increase in size with great rapidity. and it is asserted by the seal fashers that they double their bulk in eight days. The greater portion are tanned and examelied with black varnish for Indice' shoes; other descriptions are well adapted for fur, especially the seal of the South Seas and the north-west coast of America Before they can be used as a fur, it is necessary to remove the very coarse hairs which cover a beautifully fine and silky fur. The roots of these hairs are deeply seated in the substance of the thick pelt, while the fur is strongly attached to the upper surface of the skin. By shaving the pelt to half its natural substance the roots of the coarse hairs are cut through, and they easily fall out; but the same effect is produced by a natural process of fermentation, which cusues when the skins are properly prepared and allowed to reason together. The soft curry fur of the seal is now rarely used in its natural state, but is dyed a deep Vandyke brown, and has the appearance of the richest velvet. Fox .- Of foxes' skins brought to this constry there are

many varieties; the black and after flows (Virgo Jains, see a consider) by much acretic regions are the new visual accordancy by much acretic regions are the mean visual properties. They are precised for the Department of the Plansian market, their judgity princip under the visual by the Tainstan and red flows: 1 (virgo Jainsy visual by the Tainstan and red flows: 1 (virgo Jainsy visual by the countries for ladies' dresses. The white flows or the countries for ladies' dresses. The white flows (Virgo manerous, and imprincip la troop over the frozen ear at the approach of the rigorous seeson. Webevine (fale Intern)—This naimal, which is only met with in North America, Novers, and Swedes, is now generally considered by nodogata as identical with the phinton of dat writers. It is extremely mischlessons to round a line of trape extending furly or fifty miles, merely to come at the built. The first in generally dark nut-hown, passing, in the depth of winter, almost into black, the first contract of the property of the

Bar (Cross).—There are several descriptions of burs, also made by the effect. The skin of the block bear of feet of the contraction of the contrac

Hare.—The weel ar under far of the European grey hare (Lepus timidus) is extensively used for manufacturing felt hats, both in Europe and Aucrien. A few of these are dressed for the purpose of being worn as a protection

to the chest. The white hare of Russia and the polar regions (Lepse glaci-ids) was formerly much worn in its pure white state as a lining for ladies' cloaks, and as a rulustitute for the white fox, but the skin being exceedingly tender, its use for this purpose has been discontinued. The white hare is also frequently dyed; it looks exceedingly rich, but it is also frequently dyed; it looks exceedingly rich, but is

not very darable.
Rabbit (Lepus conicelus).—The English rabbit, both in

its wild and domestic state, affords a very plentiful supply of useful fur. When dressed and dyed in imitation of other skins, it is manufactured into a great variety of elwan and nseful articles for the middle classes. wool has recently been manufactured into a peculiar cloth adapted for fadies' use, but by far the greater unmber of skins are still used for hatters' purposes. The English silver-grey rabbit was originally a breed peculiar to Lincolnshire, where great attention was paid to it; but warrens have since been formed in various parts of the country. Skins of this variety are continually exported to China and Russia, where they are much esteemed, and mand a comparatively high price. The Hudson's Bay rabbit is beautiful in the length and texture of its for, but the skio is so fragile, and the for so liable to fall off with slight wear, that it has little value as an article of dress. The white Polish rabbit is a breed peculiar to that country; its skin is often made into linings for ladies' cloaks, and being the cheapest and most useful for

for that purpose, the animal is imported in great numbers Squirrel (Scarous culqueis),-This attractive little unimal abounds in most countries, especially in Siberia and the sorth of Europe. It is from the Russian dominions that we derive our principal supply of the skins of this agile ereature, which exceeds in number that of any of the furproducing animals. It is said that 15,000,000 are every year captured in Russia, our supply from thence exceeding 3,000,000 annually. The fur of the squirrel, of which there are several varieties, is light, warm, and durable; some of the lighter colours are dyed in imitation of sable. The colour of the Siberiun squirrels varies from a pearl grey to a dark blue grey: the under parts, which are white, are frequently cut out and made into cloak-linings, remarkable for their lightness; the tails are magnifactured into boas for foreign markets; they are also extensively

used in the manufacture of artists' pencils.

Chiuchilla (Chiuchilla huistee) - There are two chief varieties of chinchilla, the produce of South America: those from Lium are short in the fur, and inferior in quality to those from Bucnos Ayres and Aries; the culour is a silvery grey, Arica producing the darkest and best-coloured skins. The general appearance of the animal places it between the squirrel and the rabbit: in its natural abodes it has the agility of the former, and resembles the rabbit in living in holes and burrows. The extreme softness and delicacy of the far adapt it only for ladies' use. Though much admired and frequently worm in this country, it is more extensively consumed in France, Germany, and Russia.

Raccon (Process loter),- The raccon is an inhabitant of North America: the skins are imported into this country in immense numbers; but meeting with no demand for nur home trade, are re-exported by merchants who purchase them at the periodical sales. They are used enase them at the periodical rates. They are used throughout Germany and Russia for lining shules and coats, and, being of a durable nature and moderate in price, are esteemed as one of the most useful fors

Common Badger (Meles vulgaris); American Badger (Meles Laboutherica).—The skin of the European badger, from the wiry nature of its hair, is generally used for the numufacture of superior kinds of shaving brushes; but the skins exported from North America have a soft, fine fur, which renders them suitable for many purposes for which the larger furs are used.

Cat .- In Holland the cat (Felis descrition) is bred for its fur; it is fed an fish, and carefully tended until the for arrives at its greatest perfection; large numbers are also collected in England and many other countries. The wild cat (Felia cates) is much larger and longer in its fur, and is met with in extensive forests, particularly in Hun gary; the column is brownish grey, mottled, and spotted with black. The softness and durability of the fur render it very suitable for cloak-liaines, and it is also made into wrappers for open carriages and railway travelling. Canada Lynx (Felis Conodonis); Lynx Cat (Felis Rofa).—The fur of the lynx is long, soft, and of a greyish

brown spots; the belly is white, silky, and not nofrequently spotted with binch. The change of fashion has quently spotted with black. The country of same for some time disearded it from this country; but it is

dved, prepared, and exported in considerable quantities for the American market, where it is much valued and admired. It is generally used for clonks, linings, and facings, for which purposes it is very appropriate, being exceedingly soft and light.

Furs are subject to injury by several species of moths, whose justinets lead them to deposit their eggs at the roots of the fine hair of animals.

Limmus mentions five species that prey upon cloth and furs, of which Tinea pellimella, T, restonella, and T. worm batched than it cats its path through the fur, and continues increasingly destructive until it arrives at its full growth, and forms itself a silken covering, from which in a short time it again emerges a perfect anoth.

Another cause of the decay of furs is the moisture to which they are frequently exposed; the delicate structure of the fine under-fur cannot be preserved when any dampness is allowed to remain in the skin. This fact is well known to the leuther manufacturer, who, having wetted his skins, allows them to remain in a damp cellar for n few days for the purpose of removing the hair, which is pulled out with the greatest facility after remaining only one week in a moist condition, It follows from these observations that to preserve furs it is necessary to keep them dry, and to protect them from moths; if exposed to damp or rain, they must be dried at a moderate distance from the fire; and when put by for the summer should be combed and beaten with a small cane, and very carefully secured in a dry brown paper or box into which moths cannot enter. During the summer they should be examined once a month to be again benten and aired, if the situation in which they have been placed be at all damp. With these precautions, the most valuable furs may be preserved uninjured for many years.

The Jury award Prize Medals to the following Exhibitors in this department :-

BEVINTONS and Monais, King William Street, Loudon (532, p. 535), for a collection of good and well-mannfactured furs and skins, both antural and dyed, of stone marten, banm nearen, Kolinsky, suble, and ermine.

Clans R. Romary, and Soss, Chenpaide, Loadon (307, p. 534), for a well-assorted collection of manufactured

furs in ermine, mink, musquash, grobe, and seal. Tentral Committee, Nova Scotia (2, p. 970), for a boice collection of skins, the produce of Nova Scotia. fully described in Illustrated Catalogue, with the names attached to the specimens

DRAKE, R., Piccadilly, London (306, p. 534), for three beautiful muffs made from the choicest skins of

the Russian sable, the grebe, and miniver. Eccens, P., Moscow, Russin (not in Catalugue), for a for carpet, well designed, and of good workmanship GEVER, J., Pesth, Hungary (346, Austria, p. 1024), for a national clock called the Banda, made from Hungarian lamb skins; the tanned leather, which is richly em-

broidered, forms the exterior of the clock HUDSON'S BAY COMPANY, Fenchurch Street, London (301, pp. 529-534), for a choice collection of far skins, the produce of their possessions in North America, consisting of twenty-seven groups, which are fully described in the Illustrated Catalogue, with their scien-

tific names Kellice, Henry, 9, Butterland Street, Hoxton, London (not in Catalogue), for models of a miniature tigress and ents, displaying great ingennity nod excellence in design and workmanship, each hair of which is said to have been separately fixed by the hand. Könto, L., Berlin (139, Prussia, p. 1056), for a camaille

of superior workmanship, made eatirely from the tails of the mink Mayes, M. and S., Bow Lane, London (304, p. 534),

for a variety of manufactured articles made from the skins of the rabbit, and dyed in imitation of more costly furs, by which a cheap, wurse, and ornumental clothing is brought within the means of the working classes. RUSSIAN IMPERIAL CARINET, St. Petersburgh (not in Catalogue), for a pelisse lining made from the necks of

the silver fox, for a Russian suble lining, and for skins of the same animal, from Karuschatka. SNITH, GENZAGE, and SOSS, Walling Street, London (310a, p. 534s, for an assortment of good and well-manufactured furs under from Russian suble, North America factured furs under from Russian suble, North America

sable, chinebilla, ermine, and squirrel.

TURKEY, Ilia HIGHNESS THE SULTAN OF (1, Turkey, p. 1387), for a large and interesting collection of skins,

the produce of Turkey.

Wantiso, K. Copenhagen (7, Demmerk, p. 1505), for a fire capter, with staffel floors serving an footstook, in which the design and workmannish new in good toutce. The state of the state of the state of the state fully designed; also for a choice collection of other fars, the state of the state of the state of the state of the lining made entirely from misk talks, and for a similar article made from the paws of the fisher (Zwiete Camdown). Both specimens allow great skill in ammidiately. Both specimens allow great skill in ammi-

The Jory make Honourable Mention of the following Exhibitors:—

BOLDNER, S. (not in Catalogue), for a fur hearth-rag

presenting the Royal Arms of England.

Dick, A., 35 George Street, Edinburgh (211, p. 534),
for a well-manufactured hearth-rag of many pieces of fur

neatly and artistically arranged. Huxarson, J., Nostreal (107, Canada, p. 265), for sleigh robes and other fars, the produce of the colony. Lavazorou, Local Construct, per T. C. Arcuss (270, Class XXIX, p. 803), for specimens of the various skins imported into Liverpool, methodically arranged, and with their scientific names attached. (Awarded a Prize Medal by Jury of Class XXIX.)

Feathers.

The benotiful colouring and graceful forms of these ornaments have always attracted general admiration, which the closest inspection tends only to increase. Whether our attention is drawn to the soft delicacy of the down of birds, or to the mechanical structure of the pinion feathers, which combine the greater strength with lightness, they are equally interesting and in-

structive.

The kinds which are used for dress are those of the ostrich, the marabout stork, the rhea or American ostrich, the emn, the osprey, the egrette, the beron, the natrenga, the hirds of Paradise, the swan, turkey, peacock, argus

Next in request to the feathers of the estrick are those of the marshout stork, which are of two kinds, white and grey. These are imported into this country from Calentainties. They are very much admired for their beautiful texture and extreme lightness, and are used for bread-dresses, muffix and boax. The white kind have at times been so scarce us to be worth their weight in gold.

The feathers of the rhea, or American outrich, are untilly imported from Bousos Ayres. They are used to a variety of purposes by the natives, who dy the thin is longht of the peasant girls in the dofferent colours, and form head-dresses and coverings for the body. The Bonay kinds are used for military exhausting of tritled to a raticles of direct.

plumes in South America and in Europe, and the long brown feathers of the wing are made into brooms and dusting brushes.

A very graceful planne is made from the feathers of the ema, which are much prized on the Continent, and worn there both of their natural colour and dyed. The feathers of the captry and the egrette, which are found in various parts of the globe, are chiefly used for military costames by bussear regiments; those of the smaller egrette, which are the most graceful, are worn by

The feathers of the Indian heron and the antrenga are much prized on account of their scarcity, and are frequently worn by castero princes.

Birds of Paradise, which are imported from the Manillas, have in all ages been in great request as ornaments both for men and women, and were formerly very rare. They are favourite decorations for the Turkish turbun, and it

are favourite decorations for the Turkish turbon, and it will be remembered that they were worn by the Nepaulese princes when in this country.

The feathers of the common cock are also used for

ladies' riding hits and for military planes. The greater part are imported from llandurg. The down of the tarkey, the swan, and the goose, is made into planes, muffs, and tippets; and from the feathers of the libs, wreaths and trimmings are formed, which are much andmired for the brilliancy of their colours.

The manufacture of feathers gives employment to a great number of females, and is principally confined to England and France, although of late manufactories have been established at New York for goods suitable for that country.

The Jury award a Prize Medal to the undermentioned firm:—

ADCOCK and Co., 3 Princes Street, Cavendish Square,

London (323a, p. 534), for an admirable collection of the most beautiful kinds of feathers, manufactured and dyed for ornamental purposes.

The Jury desire to make Honourable Mention of the following Exhibitors:—

BOOTE, J. P., Cork, and 80 Hatton Garden, London

(112, p. 533), for various articles of ladics' dress made from turkey-down and feathers. Fostras, Sox, and Dractas, 16 Wigmore Street London (74, Class XXIX., p. 795), for a handsome muft and loss of marshout feathers.

HENOC, 1 Rue St. Sanveur, Paris (261, France, p. 1189), for screens and feather-brooms made of ostrich, penceck, and other feathers.

Penceces, and court's restories.
L'Hirtzatra, E., 86 Rice St. Martin, Paris (1925, France, p. 1239), for various kinds of feathers for organization process, head-dessex, clouks, screens, &c. Lonor, A. A., 50 Rice Burg L'Abbé, Paris (1929, France, p. 1240), for plannes of feathers and acreeus of

rious kinds

needle-women.

Panorr, Pettr, and Co., Ree de la Bourse, Paris 1852, France, p. 1223), for two rars and magaifecus Persian heron plumes and other fancy feathers for dres, Charadela Prite Medal by Jury of Class XXIX.) TOLILY, Grooce, Besley Hall, Naffordshire (184, Class XX, p. 586), for tippets, clouks, victorises, and muffs made from geose-down and feathers: a manufacture catalished with the view of giving a new employment to

Artificial Hair.

The material for this inde, which gives occupation to a large number of manufecturers and worksine, is preserved from the north of France, Belgium, and Germany, and sense of good quality is occurateally brought from Irednad. The lighter-coloured halr, which bears the highest radie, is the preduction of Germany; the darket shades are imported from France. The wholesale prive means are of much higher value. A local of half, nothe is longed of the possant girls in the districts before master, when from 1 is 1 of a 16, nad in smalled.

The Jury, after carefully examining all the specimens contributed by various Exhibitors, have selected the following, of which to make Honourable Mention, as the most snitsble recognition of the general equality in style and excellence displayed in these productions:— HOUCHET, C., 74a New Hond Street (246, p. 527), for

ceimeus of the new crochet-work in wig making, on skin and on net BROWNE, F., 47 Fencharch Street, London (245, p. 527),

for head-dresses of ornamental hair Carles, H. R., 45 New Bond Street, London (251, p. 528), for wigs and head-dresses. Regent Street, London (259,

Cause, D. A., 267 Regent Str p. 528), for perukes and head-dresses CROISAT, J., 76 Ruc de Richelien (1574, France, p. 1252), for perukes without toupies, produced by ma-

chinery. Iropoak and Haanpy, 217, Regent Street, London (253, p. 528), for wigs, perukes, and other works in

Rnna:v, W., Richmond, Surrey (262, p. 528), for ladies' head-dresses THIRITERIE, 4 Rue Vide Gousset, Paris (695, France,

p. 1212), for perukes and ladies' fronts.
TYZACK, W. V., Norwich (264, p. 528), for specimens of manufacture io false hair WINTER, W., 205 Oxford Street, London (249, p. 528).

for wies and head-dresses. The Jury are much indebted to Mr. NESSITT, Wigmore Street, to Mr. JENNINGS, Quadrant, and to Mr. DALLING. Old Bond Street, for their valuable assistance in the

examination of the various manufactures in artificial Word Hair for Familtone and other purposes.

Hair used for weaving consists of the long hair from liorses' tails. It is procured principally from South America and from Russia. All the black and grey hair is dyed for the manufacture of black hair-cloth for covering furniture. White only can be dyed so as to produce what are called fancy coloors, such as green, claret, crim-son, scarlet, &c., and great care is required in the process, which, however, when well managed, prodoces good permanent colours.

The quality of the cloth, as well as the brilliancy and permanency of the colons, depend also in a great degree on the nature of the warp, which may be either of cotton, linen, or worsted. Coloored halr-cloth (principally ma-nufactured at Worcester, Sheffield, and Paris) has been extensively used in the fitting up of steam-vessels, and for covering chairs, sofas, railway carriages, &c. Some of the lighter colours have also been used for boys caps,

slippers, &c. In the manufacture of hair-cloth, the weaver uses a In the manuscure or many-room, the waves uses a sort of look-abuttle, which he passes between the threads of the warp, or shed, towards his left hand; the assistant, nr "server," places a single hair over the end of the look, and the waver draws it through the warp. This operation is a tedious one, and the hairs being necessarily placed in singly, prevents the application of machinery which is so advantageously used in fabrics where the

shoot or west consists of a continuous thread In this department, the Jury award Prize Medals to the following Exhibitors :-

DELACOUR, H. P., 47 Rne Vieille du Temple, Paris (472, France, p. 1290), for horsehair and "vegetable silk" damask.

FORRER, A., 136 Regent Street, London (99, Class XX111., pp. 689-90), for ornaments worked in hair and gold. HAUSSENS-IIAP, B., Velvorde, Brussels (257, Belgium p. 1159), for horse-hair fibre stuffing for furniture, and

other manufactures in hair, LAVCOCK and Sons, Sheffield (330, p. 535), for horse-

LAYCOCK and SONS, Sheffield (330, p. 55a), for norse-hair damask, &c., of superior manufacture.

LEKONYRA and Co., 1 Rue du Cog St. Honoré, Paris
(300, France, p. 1223), for ornamental hair-work.

WEBM, E., Worcester (243, p. 527), for coloured haireloth and cloth composed of silk and hair; silos for eloth and cloth composed of silk and hair; also for specimens of which are met with both in the English and horse-hair carpets, woren in the same manner as Brussels Foreign sections of the Exhibition.

carpets. In all these articles great excellence of manufacture has been attained.

WISDON, RUSSELL, and WHITMAN, Cleveland, Ohio, America (205, United States, p. 1450), for superior spe-cimens of carled hair for furniture.

An exhibition of the various descriptions of leather hrought from every country, affords an apportunity of comparing the peculiar qualities and excellencies of each, which must be highly instructive both to manufacturers and artizans. Many of the improvements in this branch of trade have been introduced from other countries, where they have originated in causes purely local: thos. Russian leather, so much esteemed for its scent, is tanned with the cheapest bark of the country, and softened with an oil extracted from the bark of the hireh tree, also abandantly produced; the combination of these materials gives the scent and qualities so highly valued in Russian leather. The peculiar softness in French curried leather

is io part attribotable to using the bark of the evergreen oak, with which the better descriptions are tanned; the sole leather of England, which is not surpassed by any of its class, is dependent, to some extent, npon the superior oak bark that abounds in our island. The bark of the oak tends to give firmness and solidity, while other sorts are remarkable for the softness they

impart to the leather; and each material used in tanning gives some distinct quality in respect to colour, seent, toughness, or capability of resisting moisture and decay. Experience shows that the tanning principle in different combinations is found in the bark and leaves of many

trees; and it is to be expected that an extended compa-rison of the various descriptions of leather, for the first time brought together, will be the means of suggesting many improvements Chemistry has hitherto done less in this branch of

manufactore than might have been expected. Though numerous experiments have been tried, and many patents provement, no marked progress, to show that better results have been ubtained than by the old methods of tanning.

Very much has, however, been effected by mechanical means during the last 50 years. The steam-engine has leather-dressers and tanuers. It is used in grinding bark, for softening foreign hides, and in giving motion to many machines for washing, glazing, and finishing leather. But the most important results have arisen from the invention of very ingenious machinery for splitting hides and These machines completely separate the opper

from the under surface, leaving each part of the same superficial dimensions as the original hide. This is effected by means of a long sharp knife, kept in rapid motion about the sixteenth of an inch from the edge of a amooth bar of iron, over which the skin is drawn by a revolving cylinder. By another machine the skin is pressed between two revolving rollers, and presented, as it emerges, to the edge of a long straight knife, which is nicely adjusted between the upper and under surface of the skin, and kept in motion backward and forward to facilitate the operation of splitting. These machines are now common in most of the leather manufactories of England, and in some of the most important establishmeuts on the Continent.

ments on the Continent.

The hydraulic press is found to be a very useful anxillary for expressing the grease from sheep skios; it enables the leather manufacturer to dye more brilliant. colours, which cannot be well done while any grease remains in the pores of the skin. By these appliances the tanners and leather-dressers are enabled to produce a more per-fect and a cheaper article. The improved facilities of transport, the abolition of excise duties, and the greater freedom of our commercial relations with other countries,

have all tended to the same desirable result. We proceed to give a short account of several descrip tions of skins used for tanning and leather-dressing

Horse Hid

Here hides are brought into this country in large numbers; the principal supply is from South America, from whence 180,000 were imported last year. The hone was unknown in South America previous to the bear was unknown in South America previous to the wind over the flat plains of that country, and is cought for the value of in label and hair. There asks are manifely appropriate for lader above, either as cordions or by a machine described in another part of this Bepart. The price of these bailed was not considerably; at the prevent limit the value is very low, not exceeding to do.

Ox and Con Hides, and Calf Skins.

On and one hides are produced in very large number of the control
Hippopotamus Hides.

About 100 of these hides have been anusally imported into London from South Africa; they have been transed in oak bark, in which state they make exceedingly thick and compact leather: no very suitable application has yet been found for them.

Deer Skins,

Deer skins produced in this country are manufactured into oil or chamois leather, and appropriated for glores, hreeches, boots, and hraces. A very large number are annually collected in North America, and manufactured in the United States. A small portion of these skins are used in this country and in Germany. The hair of the deer is said to be the best material for stuffing addles.

Hog Skin

English Steep and Lamb Stins.

The immone supply of English skeep alans afficies competition to many large entailmances, in which they are insendenced and variously coloured sinake to an insendenced and variously coloured sinake to the coloured sinake and the coloured sinake and the coloured sinake. The coloured sinake are supplied to the coloured sinake and the coloured

hids it gold to the little, while the ferror is entirely acquired. In proportion to the fineress of the word, the compentess and value of the poil are depreciated. The snaply of sheep and thus he is manually produced in Loudon and its 'visinity exceed a salition and a half'; a transity with the same of the lower half is a same timed with a smarter in the lower half in manufactured into purchasest and channois leather. Of lamb skins, the grain or apper sarrice is frequently made into white leather for juing over the suppress of themselves the cluster for linking gloves.

Cape of Good Hope Sheep Skins,

A twy distinct variety of sheep akis is imported from the Caper (Good Biege; the work is then read course, the Caper (Good Biege; the work is then read course, sheep has a tail of extraordinary thickness, frequently as the cape as the case of the animal, and banded with far. Foreign and English Lamb Skins for Gloves,

In Italy, Spain, and the south of France, it is the error to this the heart as that the land a much ording provide of the growth to the land the land of the growth of gro

Seiss Goat Skins

The post is reared in considerable numbers in Sevinerland, Inly, and the south of France, for the valuable milk which it supplies. The akins are preserved with of the supplies of the supplies of the supplies of the of making stan superceoke lether. These from Sevinerable bear the highest value, on seconat of the period the other parts of the akins, which enables the moreous colours. The texture of great-skins is very strong, and more durable that the skep; from which circumstance they are well adapted for covering relativests and lining Sevineration and the valley of the likes, imported from Sevineration and the valley of the likes, imported from

Cape Goat Skins.

Skins of the Cape goat are much thicker than any other kind, and are applied to purposes where great strength and substance are required. The body of the animal is as large as the fallow deer. Many of the skins are exported to Gernany, where they are imanfactured into leather for the common dresses of the peasantry.

Monodore and East Indian Goat Skins,

Mogadore gost skins are distinguished by the great length of the hair, which, when aborn from the skin, is carled and manufactured for stuffing chair-seats and mattresses. The skin is rather inferior in quality, and usually made into black morocco, which, from the eireum of our first supplies having been derived from Spain, still retains the name of black Spanish leather. East India goat skins are small in size and extremely

short in the bair: they are appropriated for ladies' shoes, and occasionally dyed for covering chair-sents.

Kill Stine

Kid skins are collected in the south of France, Germany, Switzerland, Italy, and Ireland. French skins are the most perfect, and of the finest quality; those from Ireland, of which there are 60,000 skins annually exported, are also highly valued. East Indian kid skins are adapted for light above, but are occasionally made into gloves. As soon as the kid begins to feed on berbare. the fineness and delicacy of the skin are injured, and the skin becomes unspited for the best gloves; it is then used for shoes, braces, and binding-leather, for which purposes it is well adapted on account of its great strength and elasticity.

Scal Skins,

The sent has been already mentioned among the forproducing animals; the particular species whose skins are manufactured into leather are found in great numbers on the shores of North America, from Newfoundland to the Arctic Ocean. As many as \$600,000 have been caught in one season, and a large fleet of vessels is employed in this trade. The oil which the animal produces is the principal inducement to its capture; but the skin, which principal inducement to its capture; not use assats, sugar-is worth from 3s, to 4s, forms no inconsiderable sum when estimated upon the large numbers that are brought to this country. The seal, when young, has long, white, silky hair, which it sheds in a few weeks, and becomes covered with hair of a courser and darker colour. In the latter state it is best adapted to the purposes of the leather-dresser. When carefully manufactured, the skin has greater strength in proportion to its anbstance than any leather that is mountly worn. It is generally made into black enamelled leather for ladies shoes, and is much used for shoe-binding, where great strength is necessary. From experiments tried on seal, porpoise, and whale leather, that are exhibited in the Canada department, it appears probable that the skins of the marine mammalia have greater strength than those of landanimals.

Skins and furs in the undressed state are liable to be eaten through by the grub of a small beetle (Dermester eulpium). The eggs are generally deposited in some erevice about the head of the skin. These produce a swarm of hairy gruls, which feed upon the pelt, and grow to the size of small enterpillars. Instances have been known where the entire value of a foreign package of skins has been destroyed by these insects, and the of skins has been destroyed by these insects, and the annual loss occasioned by them in this country is com-puted to be from 2000/l, to 5000/l. They are found to be most destructive when skins are packed in midsummer or nutume, at which season the insect flies alread and deposits its eggs unperceived as the skins are drying in the air. The collections of skins packed in spring and winter are not liable to this injury. Camphor and tohacco-leaves have been tried against the depredations of this insect, and each has been attended with some success, but not so entirely as to recommend either of them as a complete preventive.

Rough Tanned and Sole Leither,

The number of exhibitors in this subdivision is 53, of

whom 15 are in the English department, 9 in the French, and 29 in other sections of the building. The sole leather in the English department has for the most part been tanned with oak bark, but we notice some varieties in the collection of Messrs, Bourcesz, Mon-TIMES, and Co., and in the Australian division, in both of which there are specimens that have been tanned with mimon bark. The Hon, Z. PRATT, of Prattsville, New York (102, United States, p. 1440), exhibits leather tanned with the bark of the bemlock tree: several exhibitors ave employed valonia as a principal ingredient. In the New Zoaland collection there are some remarkable va-

ricties; and in the Russian department we find specimens said to be cured with rye

Although many vegetable extracts have been discovered which are useful in tanning, inasmuch as they shorten the process and economize the cost of production, yet no material has yet been found which combines so many valuable qualities as oak bark for tanning sole leather; it fills more completely the pores of the hide, and prevents the great absorption of water to which leather tanned with other material is liable.

The simplest method of tanning sole leather, still practised in some of our colonies, is, to shave the hair from the hide with a sharp knife, and to steep the pelt in bark liquors for a year; by which time the gelatine of the hide has ebemically guited with the tannin, and the process is complete. In England it is customary to remove the hair by immersion in lime-water; if this process is carried beyond the proper point it dissolves too much the soluble gelatine, and renders the leather porous

Since the abolition of duties on tanned hides and skins, a considerable increase has taken place in the importation from foreign countries, with obvious advantages to the foreign manufacturer and English consumer. Both curried and varnished calf leather of excellent quality are brought from France, Germany, and Switzerland, and large numbers of curried boot-fronts. From Australia and the East Indies arrivals of tanned feather are more frequent, and supply at moderate prices the increasing wants of the community. In many cases the economy of tanning on the site of produce is considerable: the labour and tanning materials are both procurable at less cost; much is saved by the diminished freight of the mannfactured article; and the leather is less liable to damage by moth and worm, to which untanned skins are exposed in their passage to this country. As many beautiful and well-mannfactured feathers have

come under the notice of the Jury, which bave been exhibited by proprietors, or by those who have only to a small extent superintended the manufacture, the Jury have recognized the merit of these productions by ineluding the exhibitors with those manufacturers whom they consider entitled to Honourable Mention. The Jury award Prize Medals to the following Ex-

hibitors:

Cox. W. H. and Co., Russell Street, Bermondsey, Lor don (293, p. 529), for two foreign butts very well tanned, Cnawroan, H. M., Philadelphia (51, United States, p. 1436), for calf skins tanned in oak bark. DRAFFE, R. and H., Kenilworth (293, p. 529), for a markably heavy and well-tanned English bide, weighing

DUPORT, V., 16 Rue des Francs Bourgeois St. Marcel Paris (182, France, p. 1182-3), for three split hides of twice the usual length. The increase of surface is ingeniously obtained by a peculiar mode of splitting. A machine divides the hide into two surfaces, commencing

at the neck and continuing nearly to the opposite ex-tremity; where the splitting terminates the hide is neatly

trenity; where the spatting terminates the more is easily cut to preceive a uniform thickness, and when opened out extends from 17 to 18 feet.
Fixex and Co., Toulouse (210, France, p. 1183), for well-onsonifactured sole and harness leather.
HEFRIEN, JOHN and Thomas, Long Lane, Bermondeey (293, p. 529), for an English crop butt, of good substance and texture, and well tamed in every respect.

Laxonon Bnornkas, Menrag-sur-Loire (1639, France,

p. 1255), for well-tanned sole leather PELTEREAU, AUGUSTE, Chateau Regnault, Indre-et-Loire (677, France, p. 1211), for sole leather of excellent

quality, tanned by two methods.

PELTREAU, F., jun., Chatean Regnanit, Indre-et-Loire (949, France, p. 1225), for sole leather of excellent quality, tanned in oak bark; some of the specimens have been tanned without the usual application of lime

The Jury make Honourable Mention of the following Exhibitors:

BEAUCHAP DE BARÉ, A., Namur (262, Belgium, p. 1159), for tanned hides, applicable for soles and pump-buckets.

BOUTCHER, MORTIMORE, and Co. (293, p. 529), for tanned sole leather.

BUCKNALL, GEORGE (293, p. 293), for tanned hippo-potamus hides of renurkable thickness. BUSCHMANN, J. W., St. Vith (386, Prassia, p. 1072), for well-manufactured sole leather.

ESTIVANT BROTHERS, Givet, Ardennes (1214, France, p. 1235), for a Buenos Ayres hide, tanned in oak burk.

EVERSHED, Sussex (293, p. 529), for well-tanned light sole leather Harsen, J. de J., Waedenschwyl, Canton Zurich (172,

Switzerland, p. 1277), for a specimen of sole leather, tanned in oak bark. Hughus, T., Hull (16, p. 518), for specimens of the tanned hide of the walnus, and polishing wheela covered with the same; also for stuffed heads of the male and

female walrus, taken at the Davis' Straits fisheries. Kelsey, J. T., Lingfield, Sussen (266, p. 528), for a well-tanued crop hide, weighing 82 lbs. The process of tanning occupied two years.

Masson, CHARLES, Hoy (267, Belgium, p. 1152), for tauned sole lenther of good quality. Curried Leather,

Leather, having been first tanned and dried, requires to be reduced to an even substance, to be well extended, and made supple with fat or oil, before it is fit for the

upper part of boots. In the latter operations consists the art of the currier; and although much of the strength of the leather depends upon the previous treatment, still great attention and judgment are required to conduct this process perfectly. No article enters more generally into the consumption of the affinent and labouring classes; and it is evidently a subject of some importance to adopt those methods of currying which secure the greatest suppleness of leather, combined with durability.

The manufacturers of France have for many excelled in their mode of tanning and currying the finest descriptions of calf leather: those from the south of France (Bordeana calf), which are reported to have been tauned with the bark of the evergreen oak, are extremely soft and plinble, and their merits are obvious from the extensive sale they meet with in this country. The mode of tanning and currying pursoed by the English exhibitors is adapted to hear exposure to wet, and great improvement has taken place in the method of rendering magnetization in a taken piace in the instend of frindering the leather soft and casy to the wearer. The Swiss exhibiture have shown some very excellent leather of this class, for the upper parts of boots and shoes.

There are upwards of 70 exhibitions of entried leather,

of whom 20 are in the French division, 13 in the English, and the remaining 44 are distributed through every section of the Building.

The Jury award Prize Medals to the following Exhi-

Bossano, L. Church Street, Bermondsey, London (294, . 529), for curried calf leather of superior qualities, comp. 529), for curricu cast tentner of superior quality, binlug great strength with softness and pliability. COURTEPÉE-DUCHESKEY, 11 Rue du Renard, St. Sauveur, Paris (806, France, p. 1219), for hoot-fronts, very

pliable, and of good quality, principally manufactured from the celf skins of Paris. Cozena and Granters, Walsall, Staffordshire (283, p. 528), for tanned and curried teather, adapted for

dles, and for well-manufactured hog skins, DEFAUX-LACOUR, Guise, France (167, France, p. 1181),

for curried calf skins and well-tanned sole leather GUILLOT, J. A., 17 Rue du Boulai, Paris (534, France, p, 1204), boot-fronts of various kinds, very well manu-factured.

HEMSWORTH and LINLEY, West Smithfield, London (20, p. 519), for boot-fronts, and cordovan of excellent

quality and workmanship.

HERRENSCHEIDT, G. F. Strasbourg (538, France, p. 1204), for boot-fronts, and curried calf-skins, soft in

JETU, C. A., Quebec (109, Canada, p. 965), for enried porpoise leather, and samples of leather from the skin of the whale; the porpoise leather is of fine teature and con-

siderable toughness, and is remarkable as the first of the kind exhibited in this country. LAMBERT and Sox, Bermondsey New Road, London

(63, p. 521), for waxed calf skin boot-fronts, and cordovan, of good qualities and workmanship.

Prix, A., Jun., Nantes (1411, France, p 1243), for russet and black curried ealf leather, well manufac-

tured. Mencien, J. J., Lausanne (175, Switzerland, p. 1277), for curried calf leather, boot-fronts, and chamois leather,

well manufactured for the purposes to which they are applicable.

MERKLINGHAUS and WEX, Barmen (672, Pruss) p. 1987), for dressed hides manufactured for saddlery and harness.

Savousore, M., Moscow (232, Russia, p. 1374), for curried calf leather of good quality, und a few calf skins tanned and curried, with the hair attached as an imide

lining for the boot; extremely soft and pliable.
STOCKIL, W., 33 Long Lane, Permondsey, London (17)

p. 518), for specimens of boot-fronts, very well curried from the English leather. SCSER, H., Nantes, France (1022, France, p. 1227), for a good assortment of curried calf leather and foot-fronts. VENTUJOL and CHASSANG, 21 Rue des Gobelius (1384,

France, p. 1242), for boot-fronts manufactured from Bor-deaux calf skins, remarkable for peculiar softness, fineness of texture, and the great toughness of the material. The Jury make Honourable Mention of the following

Budgs, R. A., Rue dn Fer à Moulin, Paris (77, France,

p. 1175), for curried horse hides, suited to the upper part of boots and shoes. Buse, N., Swansea, Wales (4, p. 518), for curried calf leather, well manufactured.

FORTIER BEAULIEU, Rue de la Lunette (510, France, p. 1203), for eurried leather suitable for harness and saddlery. GHISLAIN-DUBOIS, Binche (469, Belgium, p. 1166), fur

cow hide curried for strap leather HOGARTY HROTHERS, Cork, Ireland (13, p. 518), for eurried calf leather and boot-fronts, very well manufactured

Massemin, C. L., Rue de la Reyne, Paris (1345, France, p. 1240), for calf leather adapted for boot-fronts. OBERCONE, IL., Trèves (383, Prussin, p. 1072), for curried leather, and for a well-tanned hide, a perfect imi-

tation of Russian leather PAILLART BROTHERS, Roe du Grand St. Michel, Paris (338, France, p. 1193), for calf and sheep leather manufactured for straps and rollers REULOS, A. J., 13 Rue Geoffroy St. Hilaire, Paris

(1454, France, p. 1244), for curried borse leather, adapted for boots and shoes. Soffier and Co., Lincoln's Inn Fields, London (51, p. 520), for an extensive assortment of good leather, ma-

nuffictured for coach and harness makers.

Tallet, V., Brussels (254, Belgium, p. 1159), for boot and shoe leather, well manufactured

Woop, W. and S., 32 Bow Street, London (25, p. 519) for a well-manufactured assortment of calf skins, curried and dyed in imitation of Morocco leather.

Varnished Leather

Varnished and enamelled leather has been brought to great perfection during the last 25 years, and increases in general demand as the improvements in its manufacture become generally known. Though the difficulty of making a bright varnish adhere to leather which is required to bend freely, and retain an unbroken surface, is considerable, it has been successfully overcome by the one of boiled linseed oil, mixed with vegetable black and Prussian blue to deepen the colour. This composition (the consistence of a thick paste) is rubbed on to the surface of the leather by hand, and dried in a stove heated to 150 and 170 degrees Fah'. The operation is repeated from three to seven times, according to the anture of the leather, and when the varnish is thoroughly dry, it is facturers.

found to adhere very firmly, and to bear considerable tension without fracture.

Many coloured pigments are mixed with the varnish,

stany coonered pagments are maked with the variance without materially altering its tenacity; by this means the most brilliant colours are produced, and the leather is readered more applicable for ornamental purposes. The number of Exhibitors in this branch of the leather

The number of Exhibitors in this branch of the leather trade is thirty-three, of whom nine are Germans, seven French, funr English, and thirteen from other countries.

Prize Medals are awarded to-

COURTOIS, E., 12 Faubourg Montmartre (1571, France, p. 1252), for black and coloured varnished calf hides, brilliant on the surface, and well manufactured. Dr.v.p.Dr., J., 18 Boulevard de Charonne (813, France, p. 1219), for a large assortment of well-manufactured calf and cow hides, adapted for shoremakers and coach-manufac-

Dixos and Witting, Bermondey, London (200, p. 529), for an assortment of varnished and enamelled his not splits, adapted for conclumaters, &c. In this collection the practicability of splitting three surfaces from one hide, is shown by the exhibition of the three parts separately tamed and varnished.

rately tanned and varnished.

Dozan and REINHARD, Worms (33, Hesse, p. 1128), for a good assortment of varnished calf leather for shoe-makers.

GAPTIER, J., 4 Faubonry Montmartre, Paris (1244, France, p. 1237), for black and coloured varnished calf leather, on which the cuamel is brilliant, and the leather sufficiently pliable.

HEINTZ and FREUDENBERG, Baden (382, Prussia, p. 1072), for black varnished calf leather, on which the enamel is strong and brilliant.

HEYL, C., Worms (32, Hesse, p. 1127), for varnished calf leather of excellent quality. HOUSTER, A. and Co., 46 Kue du Fer k Moulin, Paris (127), France, p. 1238; for a superior assortment of black and coloured varnished calf leather.

black and coloured varnished calf leather.

Jones, jun., Brussels (306, Belginm, p. 1160), for a
white varnished hide of superior quality, and for wellmanufactured curried leather.

MAYER, MICHER, and DRYINGER, Mayence (36, Hesse, p. 1123), for jupaned and varnished hides, and calf leather, and for morocces, roans, and skivers, dyed in great variety of colour. These Exhibitors also show currical leather for harvess, and other purposes. Each description of leather has been well manufactured.

Nvsr and Co., 132 Fashourg du Temple, Paris (1373, France, p. [142), for black varnished calf leather, manufactured very perfectly for boots and shoes. The varnish is brilliant, and sufficiently strong and elastic to bear the bend and strain to which it is liable.

OASTLER and PAINER, Bermondsey, London (286, p. 529), for a large assortment of enamelled and varnished leather for conchmakers, and for a very well tanned crop hatt.

The Jury make Hononrable Meution of the following Exhibitors:—
Hall, Sydney, New South Wales (not in Catalogue),

for enamelled kangaroo skins, manufactured for boots and shoes. MAYER, IONAS Munich (46, Bavaria, p. 1100), for varnished calf and very good enamelled coach hides.

MINOPRIO and Hottureners (37, Hesse, p. 1128), for varished calf and coloured japanned hide. Rorn, C. W., Frankfort (9, p. 1122), for varnished

Vignat's, L. J., Barcelona (249a, Spain, p. 1344-45), for varnished calf leather, suitably manufactured for boots and shoes.

calf leather.

Morocco and Dyed Sheep-akin Leather, 4c.

Morocco and dyed sheep-skin leathers are represented by thirty-one Exhibitors from Paris, London, Leeds, Mayeace, Barcelona, Tonis, and Tarkey. This description of leather is tanned with the leaves of the sumuch tree (Elva covision), imported into this country from the Island of Sicily. Great excellence has been attained in

the manufacture, both in the brilliancy and variety of solours, especially when it is considered that neither strong acid, nor great heat, can be applied without danger of destroying the fibre of the leather.

The specimens of moreceo from Turkey, Tunis, and Egypt, show the manufacture in its origin, and no alteration appears to have taken place in the mode of dycing, det, since the period when wostern Europe was indebted to them for this manufacture. The red morece of Turkey and Egypt is brilliant and permanent, and though well suited for their particular use, is not adapted for external consumer.

The Jury award Prize Medals to the following Exhlbitors:-

HATVET BROTHERS and Co., 16 Rec Manconseil, Paris (415, France, p. 518), for an assortment of moroces, roan, and calf leather, finished with great regularity, and in a variety of beautiful colours. The cochineal red and the various shades of green morocco, are remarkable for the fulness of colour. The black morocco is also of good

Enteraire and Goznoza, Strasbourg (1212, France, p. 1235), for a good assortment of coloured and black moreco, well dved and manufactured.

Wilson, Walker, and Co. Leeds (11, p. 518), for a very large assortment of coloured sheep, morocco, and east leather, well manufactured, and adapted, from their price, for general consumption.

The Jury make Honourable Mention of the following Exhibitors:-

DAVID, C., 12 Rne Manconseil (812, France, p. 1219), f for a beautiful collection of dyed morocco, for bookbinding.

DELISLE and Co., Gresoble (1181, France, p. 1234), far specimens of sheep and morocco leather, printed in permanent colours, for farmiture, &c. DEED, J. S., Little Newport Street, London (10, p.

518), for a good assortment of moreoco leather, for farniture and bookbinding.

East and Sox, Bermonder, London (34, p. 519), for dyed and embossed sheep leather, in initiation of Urrebt velvet. This appears to be a good appropriation of leather which is imperfect in the grain, and is manufactured ther which is imperfect in the grain, and is manufactured

with skill and good taste.

Gronge CLEMENT, 102 Dean Street, Westminster (32, p. 319), for good specimens of morneco and Russian leather, adapted for farmiture and bookbinding.

Gronge, Joseppe, 81 Dean Street, Westminster (289,

p. 529), for specimens of leather, beautifully gilded, embossed, and painted. Geraud Brothiums, Paris (850, France, p. 1220), for dwed morocco and sheep leather, in brilliant and perma-

dyed morocco and sheep leather, in hrilliant and permanent colours.

Letwicks and Grobox, Skinner Street, London (53, p. 580), for well-manufactured morocco leather and dyed

Rose, Salvados, Barcelona (249n, Spain, p. 1345), for an assortment of morocco leather, dyed in a variety of colours, for shoes; and for well-manufactured black morocco.

Alon and Gloring Leather.

sheep-skin rugs.

Alum, or white, leather is manufactured principally for the purposes of the glove-maker, and is represented in the Exhibition by twenty contributors.

the Exhibition by twenty contributors.

The common method of making this description of leather is to immerse the prepared skin in a solution of alum and salt, in equal proportions; but where elasticity

and softness are required, as for kid gloves, very much care and attention or necessary. The skih, having been first softned in line-water, has to be many times washed, have been supported in the state of the state of the theory of the state of the state of the state of the theory of the state of the state of the state of the theory and its late died, whether over a most bloats the theory and the state of the state of the state of the volks of eggs, it is ready to receive from the dyer the beautiful colors, to well known to the public, in the manufactured article of gloves. It has been estimated glove-leader manufactured of Trans and England.

A few specimens of the excellent kid leather of France are exhibited by M. ACVEN, of PITS: these akins are mannhetured at Annousy, a town about fifty miles south of Lyous. The great superiority of the manufacture of the kid skim from every quarter of the globe are sent thicket to be converted into gloring leather. Though the supply is derived principally from the adjacent provious of France, from Indy, Switzerlan, and Grennay, ver freshed and the East Indice have of lart pears contrileated the supply of the control of the property of manufactured there is not less than 400,000.00

and the control of remark sho, that a very large partice of the lands shine, missible for gloring lamber, are sent from many countries to be manufactured at Vervit, in Somerectairr, and the adjacent neighborshood. It is not unusual to see in that place the lamber shine of lady, Ayres, and the Cape of Good Hope. The citasset and the peculiarities of witer, which are so admirably adapted for kill etather density in France, or unusual to the proper manufacture of land hairs, which require a more which are not with in England.

The following Exhibitors have been awarded Prize

Barbander, J. P., Rue du Fer à Moulin, Paris (756, France), for an assortment of dyed goat, sheep, calf, and kid leuther, in variety of colours. The because colour of this manufacturer is excellent and durable; and the softness of the alomed calf leuther reuders it admirably adapted for the upper part of boots. Conar, J. and J., Queen's Cannel, Somersetshire (314),

for Italiun lamh skins, dressed and dyed in a variety of colours, fur gloves. Lolagnies, —, 6 Rue St. Hippolite, Paris (1330, France), for specimens of kid, lamh, calf, and sheep

France), for specimens of kid, lamb, calf, and sheep leather, suitably manufactored for gloves.

The Jury make Honourable Mention of the following

BOULONE, P., Prague (334, Austria, p. 1023), for kid and lamh-skiu leather, dressed for gloves, is which the smoothness and strength of the grain have been well preserved.

Lexamenso GLOVE MANUTACTORY (4, p. 1130), for brune and hlack kill enther, sud for specimens of dyed kid and lamb leather, for gloves. MATRAT and Sooks, Rainders (10, Denmark, p. 1356), for very well-dressed leather, both for white and taucoloured gloves.

coloured gloves.

RANNORR, J. L. and Son, Altenhurg (741, Prussia, p. 1091), for an assortment of 1smh leather, dyed a variety of colours, for gloves.

Oil or Chanois Leather.

There are fourteen Exhibitors of chamois leather, of whom four are English manufacturers, two French, and eight of other countries.

The peculiar quality given to leather by the process of the uil or chamois leather manufacturer is extreme softness, which renders it a suitable article for glores, and many other uses where this quality is required.

It is manufactured by the continued application of cod-

oil to the skin, alternately with a process of beating in failing milks, and exposing to the air for partial drys, in about ten repetitions of the oiling and drying process the skins are self-discript satement, and are allowed to the state of the state of the state of the state of the tion, after which they are valued in a rong milked to too, after which they are valued in a rong milked to So recently as the commencement of the present certrary sheep alars manufectured in this mode were extra try sheep alars manufectured in this mode were extra try sheep alars manufectured in this mode were extra gradually superseded their me, and the trute has constciently described in consequence.

The Jury award Prize Medals to the following Ex-

PULINAN, R. W. and J., 17 Greek Street, Soho, Londoo (285, p. 529), for an assortment of bock, doe, and channois leathers of every description, very perfectly manufactured, for a variety of normore.

manufactured, for a variety of purposes.

TEXTEX, junior, Niori (1033, France, p. 1228), for specimens of back, doe, and fava leather, and for some well-dressed chamous sheep leather, stained in a variety of colours for gloves.

The Jury make Honourable Mention of the following Exhibitors:-

LATBET and Co., glove manufacturers, Paris (296 France, p. 1191), for specimens of chanois leather, dyed in suitable colours for gloves. (Awarded a Prize Medal hy the Jury of Class XX.)

Dyed Sheep-skin Rugs, &c.

There are thirton Exhibitors of dyel rays manufactured from English they and Aurope on pain int. Though unpose to have been been as the continued to the contin

The Jury award Prize Medals to the following Exhibitors:—

BEVINCTONS and MORRIS, 67 King William Street,

Leadon (332, p. 535), for an assortment of sheep-skin rugs, in great variety of colours. These Exhibitors show bordered rugs of several designs, in good taste; and Angoura goot skins, manufectured in a similar manuer. CLASKE, C. and J., Glastonbury (48, p. 529), for sheepand lamb skin rugs, dyed and manufactured into a variety

of useful articles.

DEED, J. S., Little Newport Street, Westminster (10, p. 518), for Angorn gost and English sheep skin rugs dyed in many beautiful colours.

The Jury make Honourable Mention of the following Exhibitors:—

Roon, G. and Co., Bolton Borough, Glastonhury (49, p. 520), for hearth rugs made from dyed Angora goat skins, and for varieties of door-mats manufactured from English sheep and lamb skins.

Winson and Son, Bermondsey, London (14, p. 518), for a good assortment of dyed sheep skin rugs, skins for cavalry saddles, and several manufactured articles. 2 c 3

Fellow and Parchagat.

Parchment is propared from sheep skins by the simplest process. After the skin has been steeped in lines and water it is streethed in a frame, and by repeated working with hat water, and a several applications of whiting which are dried in the sun, the skin is entirely eleasated from the grease. It is brought to a fine surface by skitful labour with a round sharp knife, and when dry is the former.

Vellum is made from calf skins prepared in a similar manner.
This monufacture is represented by seven Exhibitors.

The Jury award Prize Medals to the following Exhibitors: -

BIRTHAULT, Isodam (56, France, p. 1)74), for a very complete and extensive assortment of parchament and vivilum, applicable for deeds, bookbinding, tambourines, and for the machinery of spinning-mills.

LEVER, J. and J., 13 Size Lane, London (24, p. 519), for specimens of veilum and parchament, manufactured

Leven, J. and J., 13 Size Lane, Lendon (24, p. 519), for specimens of veilum and parthment, manufactured for bookbinding, deeds, and tambourines. These Exhihitars show some well-dyed veilum, and other samples adapted for paintings.

The Jury make Honourable Mention of the following Exhibitors:—

Evans and Son, 10 Silver Street, London (18, p. 518), for specimens of well-manufactured parchment, and for

direction-labels, very completely made from the same material. SONDERMANN, W., Erfort (743, Prussia, p. 1091), for vellum and parchment of extreme whiteness, prepared for deeds, drum-heads, and for machine or cylinder

parchment.

Saddlery, Harness, and Portmanterns.

In reporting on suddlery, harmers, and portamaneaus, the Jury remark, that the general ebaracter of the articles is highly creditable to the Exhibitors, and show that considerable skill and ingensity are devoted to this department of industry. There are appeared of 190 Exhibitors in this subdivision.

From the nature of the manufacture it is less concess-

trated in particular focalities than most others. There is no twan of sair in England where one or more of the trade does not find ample occupation; and as the mann-factured article containaily falls into the hands of distant makers for repair, the knowledge and inventions of one mannfacturer are quickly circulated through a containable and the containable of the containa

The chief endeavoor of the instiller and harnest-emmineutre in to obtain strength, with lightness and conveferative in the chief and the chief and the chief and other naterials. Walsall, in Staffordshire, it the principal seat of the wholesale trade, where considerable quantities of suddlers and larmess are prepared for expenional control of the chief and the chief and the chief and payed in the numerous varieties of hits, of which there are very many sorts known to the size.

The necessity of judging of the suddlery of other countries by a very different standard from our own is evident; the form of suddle, for instance, that is well designed for our smooth roads and well-trained horses, would be very ineffected in the mountainous districts of Spain and South America.

The Jury have had their attention called to some portmantana, of very ingenious and elever construction, which, from the facilities they afford the traveller of rapid arrangement and convenience of access, will promote the comfort of a very numerous class of the

The Jury award Prize Medals to the following Ex-

thitors:—

BAKER, R. J., Boston (498, United States, p. 1465), for a light harness of superior materials and workmanskip.

BLACKWELL, S. and R., 256 Oxford Street (78, p. 521-2), for placeton harmens of patient black leather. The mountings are in good taste; the materials and workmanship are also of good quality.

BLYER, R., 4 Park Lanc, Westminster (90, p. 522), for a lody's saddle, we'll manufactured; and a hunting or

a may a saccay, well manufactured; and a hunting or park saddle, with improved elastic sent. Basex, II., Walsell, Staffordshire (58, p. 520), for two cases of bits, stirrous, and source, for the South American

eases of bits, stirrups, and spurs, for the South American market. Baows and Sox, Birmingham (65, p. 521), for specimens of saddle-trees, with windebone springs, galvanised

plates, &c., to prevent corrosion.

Cassrzza, A. B., 7 ltaker Street, Westminster (77, p. 521), for well-manufactured horsar and hunting saddles.

with pair of harness pads.

Coorge, M., York (50, p. 520), for a case of saddlery, containing articles of very superior workmanship: the

racing saddle, in particular, weighing only two pounds, is remarkable for its near manufacture.

CUPP, R. 18 Cockspur Street, Loudon (96, p. 525), for an embroidered velvet saddle, riding bridle, and harness,

an embroidered velvet saddle, riding bridle, and harness, manufactured with much taste and elegance. Earsynaw, H., 91 Wimpole Street, London (107, p. 1921) for a case of harmest section.

523), for a case of harness, containing blue morocco and other heidles, well manufactured. Hickey and Tell, Philadelphia (58, United States, p. 1437), for two portmantenes, well arranged and strongly

constructed.

KANE, G., Dublin (62, p. 521), for portmanteens and camp furniture, so ingeniously contrived, that most of the articles required to furnish an officer's apartment are

contained in a travelling chest.

Lacry and PHILLEY, Philodelphia [41, United States, p. 14335, for a case of harvess, in which the monntings are of solid silver; the materials are of excellent quality, and the workmanship very elaborate.

Lacrotria, La Jazus C., Brassels (256, Belgium, p.

Labounin Le Jauxe C., Brussels (256, Belgium, p. 1159), for saddlery and harness manufactured in excellent style, with good materials and workmanship.

Sylves and seek miner teas and work amount and one (80, p. 25 feeks). W. junior, 9 haves most rected of the best materials, and well adapted for its intended me. Last, 8, 256 Oxford Street, London (38, p. 519), for a well-contrived railway portmantenn, divided into four compartments, to facilitate the access to any articles con-

tained in it.

MIDDIANORE, W., 31 Holloway Head, Birmingham
(67, p. 521), for a lady's embroidered saddle, and another
with elastic seat; also for a new monthing rein for un-

with ensure sens; labo are a new measurement.

Inches norses, &e., the whole well manufactured.

Monnas, R., Montreal (113, Canada, p. 965), for a set of danble sleeph harness, of excellent material and work-manulip.

Passoner, W., 27 Little Windmill Street, Westminster.

(79, p. 523), for a set of single home harness: the style and workmanship are in every respect superior. POLLOCK, J., Glasgow (279, p. 528), for a very perfect set of Scotch harness.

Paas and Lamins, Paris (688, France, p. 1211), for a large and varied collection of saddlery and harness; many of the articles are elegantly designed, and the materials have been well selected.

Neance and Appexit, 185 Piccadilly, London (92, p.

522, for a large assortment of whips and canes, showing much taste in the manufacture, and superiority of workmanship.

Warrs, J. C., 29 Liverpool Street, London (86, p.

522), for silver-mounted herness with improved registered tng. A very neeful and ingenious invention.

The Jury desire to make Honourable Mention of the

following Exhibitors:

Anams, H., New York (476, United States, p. 1465),

for a portable saddle ingeniously contrived.

Asuroan, W. and G., Birmingham (64, p. 521), for specimens of whips of various designs, well manufactured.

Banton, E., Walsall (56, p. 520), for a case of bridles of good weekmanship and superior quality.

- Bell, C., 34 Wigmore Street, London (93, p. 523), for a lady's saddle and single barness.
- BYWATER, W. M., 99 Piccadilly, London (94, p. 523).
- for harness and improved Russian cavalry bridles. Coway, L., Barrhead, New Paisley (273, p. 528), for a very good set of Scotch cart harness of putent leather. Hurseon, S., Dublin (60, p. 520), for a bunting-saddle with elastic scat, and a side-saddle with safety stirrups. Hugues, R., Clifden Street, Finsbury, London (106,
- p. 523), for beraldic mountings for barness.
- p. 325), for oeraldic mountings for barness. MAXWELL and Co., 161 Piccadilly, London (52, p. 520), for socket spars in various stages of manufacture. PENNEY, J., 37 Union Servet, Middleset Hungital, London (91, p. 522), for a state pony bridle, designed by W. H. Rogers, made by W. Langdon.
 STEWARY, W., Toronto (134, Camdos, p. 966), for a set
- of single sleigh harness, made of varnished leather.
- The Jury desire to record their great obligations to the undernamed gentlemen :-

- Mr. Thomas Powell, leather factor, Lime-street
- Mr. William Hackblock, Rood lane. Mr. Frederick Dandleker, Hambectikon, Lake of Zurich,
- Mr. Martin Blackmure, Bread Street, London. Mr. E. W. Roberts, Page's Walk, Bermondsey. Mr. Alfred Bymer, Nassau Street, Westminster. Mr. M. Nicholls, Little Windmill Street, West-
- Mr. George Kent, Mornington Crescent, West-
- minster. Mr. George Kidd, Associate Juror, 257 Oxford-
- street All of whom have very freely given their valuable services in the examination of many of the Exhibitors' goods, on the merits of which they were peculiarly qualified to assist the Jury in forming a correct judgment.

J. A. NICHOLAY, J. B. BEVINGTON,

London, December, 1851.

CLASS XVII.

REPORT ON PAPER AND STATIONERY, PRINTING AND BOOKBINDING.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages lu the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

Jury.

STLVAIN VAN DE WEYER, Chairmen, Beigium; Euroy Entraordinary and Minister Pienipotentiary from H. M. the King of the Belgiana. Thomas De La Ret, Popsy Chairmen, 84 Westbourne Terrace, Hyde Park: Ornamental Stationery

Mondfeturer.

CHARLES WINTETNOHAM, Reporter, Chlowick, and Took's Court, Chancery Lane; Printer.

A. Firans Diror, Joint Hiporter, France: Member of Central Jury, &c.*

Professor Histor, Zoliverei; Director of the Royal Polytechical Academy at Dresden.

Viscoun Manos, F.R.S., 44 Gravener Flace.

Histori Friess, Barnet, Vermon, Utolief States; residing at Morley's Hotal, London.

CHARLES VENABLES, Plomer Hill House, High Wycombe; retired Paper Manufacturer.

THE articles which the Jury had to examine were classified lu the following manner:

- A. Paper in the Raw State as it leaves the mill. H. Articles of Stationery. C. Pasteboards, Cards, &c.
- D. Paper and Scaleboard Bones (cartonnerie),
- E. Printing (not including Fine Art Printing).
 F. Bookbinding. The Jury met on the 17th of May, and continued their

labours till the 28th of July, when their awards were labours till the 28th of July, when their awards were finally settled and transmitted to the proper subtherities. They did not think it necessary to duride themseries into sub-committees; hat in adjudicating apon the speci-mens of printing intended for the use of the blind, they requested the assistance of George Summer, Eng., of the United States, and William Hughes, Eug., of [laughaw?] men kindly acceded.

The first duty of the Jury was to refer to the "Decisions regarding Juries," and afterwards to the "Instructions from the Council of Chairmen," in which, among other conditions, it is stated that " a classified list of the subjects contamons, it is stated that " examined must the subject to make the province of each Jury is prepared, and forms the limitation of each elass;" and that "those articles will be rewarded which fulfil in the highest degree the conditions specified in the Sectional List," namely:—

"Increased usefuluess, improved form, superior quality, or superior skill in workmanship, new use of known materials, use of new materials, new com-

bination of materials, beauty of design in form or colour, or both with reference to ntility, the cheapness with reference to production, and that the Report should describe the state of industry as shown in this Exhibition "

The Jury, in accordance with the foregoing instructions, oreeded to the examination of the different articles. proceeded to the examination of the asterest arraces. The classified list of subjects was found to be very defective, the classification only extending to English Exhibitors, and many articles were found to be misplaced in the classes to which they had been assigned. The Jury had thus to refer several articles to their proper classes, and to decide that maps did not come under their consideration, though several had, to the Official Catalogue, been inserted in Class XVII.; that the lithographic colour

 M. Didot, a Greek scholar, and an eminent typographer, engraver and typedomaler, printer to the Institute of France, and paper-manufacturer, having been appointed member of the Jury, his firm (of which he is the head partner) was excluded from competition. The Jury cannot, however, abution from seroesiant which behaves. * M. Didot, a Greek scholar, and an eminent typograhowever, abstalo from expressing their high appreciation of the important services, zeal, impartiality, and talcot displayed by M. Didot, both as Joiot Reporter and Juryman.

press, as well as all other machinery, came under the jurisdiction of Class VL, the Jury offering at the same time to give their assistance and opiniona individually or collectively, should any such assistance or opinions be desired; that they could take cognizance neither of literary merit, as had been required of them, nor of different philological systems of printing, as phonetic printing, pho-noty py, phonography, &c. &c.; and lastly, that several specimens of caligraphy and penmanship had erroneously sen sent to ther

With regard to the Foreign Department the Catalogue was still more imperfect; and the Jury had to search out the articles which appertained to their Class. It is greatly to be feared that, notwithstanding all the care taken by the Jury, there may be articles which have escaped their

It will be observed that the Jury, in strict conformity with the principles laid down by the Royal Commission, have only recommended one Conneil Medal, and that for have only recommended one Conneil Medal, and that for typography; not that they did not recognize the excellence and benefy of many of the specimens exhibited, and the skill and perfection which, in many points, the art of printing displayed, but because there did not appear to be may production so clearly bearing the character of noulig of incention or new application of a known principle as to justify such a recommendation, with the exception of the products of the Imperial Court and Government Printing Office of Vienna, which presented both moveity of invention and a number of new combinations in the art of typo-

graphy. o prize was awarded to publishers, as such, nutwith-

standing the merit of their publications. Until recently, bookselling had not been represented at the Exhibitions of Industry: the Instructions given to the Jury of the Great Industrial Exhibition of all Nations did not assign to it may distinct position; and, therefore, in the different countries the bookscilers have refrained from sending their publications, not deeming that their trade, connected more or less closely as it is with the sciences and with letters, could be looked upon as a branch of

Several booksellers of France, Germany, and Belgium have, however, thought that the creation of a book being the result of a combination of different industrial branches each as wood-engraving, metal-engraving, colouring, the choice of types, and of the various kinds of paper, &c.,
—the bookseller ought to be looked upon as the partial
creator of these industrial products, the first idea of which he had in many instances conceived

In awarding the Prize Medal, the Jury have, in each branch, observed the general principle of acknowledging the various kinds of excellence to be met with in each article under consideration, without entering into the question of relative merit.

Some articles, though having no cloims either to a Prite Medal or an Honozanthe Furnice, contained, nevertheires, some merit, which justified the Jary in noticing copinion space every article exhibited, noverthanding the cure they have taken in making a critical examination of the whole; that their Report has reference to the general state of the Paper Manufacture, Printing, and Bookhinding, as promet in various countries, and the contributions of any individual Exhibitor are seither contributions of any individual Exhibitor are seither conlination of the Report.

The Jury, in conclusion, curves their hope that the main of all matters, reliesed by the Exhibition of 1813, main of all matters, reliesed by the Exhibition of 1813, main of all matters, relieded by the Exhibition of 1813, occurrent to make the property. Property, is consistent and the section, and of type-graphy. Property, is consistent and position than in material concerns. Printers and books there, are in the control of the printers of th

The Custom-houses, now obliged to establish a search, frequently hostile, will relinquish the impediments to commerce and literature, and works will no longer be reprinted in haste, replete with errors, or mutilased according to the will of speculators, and in emulation of cach other.

Lastly, the certainty of a wider market will be an encouragement to writers of talent, and to publishers, who are frequently prevented from commencing great undertakings by the fear of secing their work immediately pirated. Universal co-operation is indispensably necessary to insorre the success of great literary and scientific

enterprises, which could not fail to flourish in a higher degree if the rights in literary property were recognized.

L PRINTING.

After an interval of four centuries, the date of the Creat Ethibition of the world's industry is coincident with the anniversary of that of the invention of printing. It seems at if all antions were assembled in the equilial tracers at the seems of the control of the control of the Press — the most powerful instrument of their elvistation. It is by the sid of printing that different autions have imprated to each other their thengbts and their feelings, and have received in some degree combined existence to the Ignorance and projection which feeler national warfars, and could never have presented this indusival

without this marvelous boid, they would have been selfwarfare, and could never have presented this shadinishle display of universal harmony and of generous enablation. When we consider the great conditions of manuscripts when we consider the great conditions of manuscripts and the benefits of which society was devoid before the discovery of printing, every friend of study and of exalted intellectual speculations should deem binariel fortunate and the properties of the study of the study of the study and the study of t

In every age, and in all countries, printing denotes the state of civilization, of which books are the reflex, and the history of the human mind is written in the progress of bibliography. Thus the first printed books of Ger-many were almost all devoted to theology and scholastic philosophy, while at Paris ancient literature occupied an equal rack with theology; thus also at Rome, where the remembrance of ancient literature maintained a still stronger empire, printing under the guidance of the Bishops of Aleria and Teramo, principally reproduced the master-pieces of classic times. In France, however, mader the influence of the chivalrous reign of Francis I, a great number of works upon chivalry soon appeared, and the desire of becoming acquointed with narratives so much in conformity with the prevailing taste, was one cause of the introduction of printing into England. Of the sixty-two works printed in London by Caxton, those upon theology do not amount to ten, the remainder being devoted to chivalry, to history more or less romantic, to Without exliterature, and to manners and customs. patinting upon this subject, we will confine ourselves to observing that at the period when the Pope founded at Rome the celebrated printing-office for the "Propagation Home the celebrated printing-effice for the "Propagation of the Faith", there was no corresponding activity on the subject in London; and that at the present day, whilst the great printing establishment of the "Propagands" remains innerive, England every year seeds borth to the world a million of Bibbes and New Testa-

Son after its first origin, the art of printing had orbitised a great degree of sperfection, and it was not till the second half of the last century, that eving to the efforts of librars, is Spain; of Bukerville and of Pollarer, in England; of the Fonlises and the Rindinsans, in Scolund; of Bodeni, in Italy; and of the Difect Inally, in Paris, any real progress can be pointed out. by Applegath's new system, that the highest degree of speed had been attained, did not experience prevent mankind from assigning a limit to the perfectibility of human investions, and to the insertuable designs of Providence.

Mr. Koesig's machines, pateuted in 1814, were far too

complicated and expensive, and the inking too imper-fect, for general adoption. They were superseded by Mr. Edward Cowper's machine, which he invested and patented in 1816. Almost all the large editions of modern works are printed by Cowper's machines, and the influence they have had on the publication of books of all kinds is far beyond any expectation entertained at the time the machine was invented. After it had been in use some time, it was stated in Court, by an emipont lawyer (now a noble Lord), that, "if it had not been for Mr. Cowper's machine, it would have been impossible to supply the demand for books:" this is not correct, for at that time the hand-press did supply the demand: but the striking and important fact is, that the marking erested a demand, and called into existence books which, but for it, would scarcely have been thought of. As the machine-work from type and wood-cuts was far better than the ordinary printing of the day, booksellers were induced to print extensive editions, because they saw the machine could accomplish all they required. One of the first booksellers who availed himself of this power was Mr. Charles Knight, who projected the "Penny Maga-zine," on a hint from Mr. N. D. Hill, Queen's Counsel. Each number, published weekly, consisted of eight pages of letterpress, illustrated with good wood-engravings The public was astonished at the chenpness and good quality of the work, but it was its immense sale which rendered it profitable; for some years it amounted to 180,000 copies weekly. Mr. Kuight, whose services in the cause of educational literature entitle him to the the cause of consumers increasive volute.

In this work. The Cowper machine has been the cause of the many pictorial illustrations which characterize so large a portion of modern publications. The "Saturday large a portion of modern publications. The "Saturda Magazine," "Chambers Journal," the "Magazin Pitto Magazine, "Lambers sourism, resque," in France, and numerous others, owe their existence to this printing machine. The principal of charge editions and large soics soon extended to establish works of a higher value. A remarkable instance of this was the edition of Sir Walter Scott's works, with notes, edited by himself: instead of the old price of 10s., they were sold at 5s, a volume, and the demand erented by this reduction of price was so great that, although the printer had a strong prejudice against machines, he was compelled to have them, the presses of his large establish-ment proving totally analie to perform the work, which amounted to apwards of 1,000 volumes per day for about two years. The Universities of Cambridge and Oxford have adopted Mr. Cowper's machines for printing vast mbers of Hibles, Prayer-books, &c. &c. A Hible. which formerly cost 3s., may now be had for is. Mr. Cowper recommended the Religious Tract Society to put aside their coarse woodents, to have superior wood engravings, and to print them with his machine. The Society adopted these suggestions, and the result is, that by sending forth well-printed books, it could now support by seeding forth well-printed books, it could now support interity their sale, without any aid from subscriptions. As no newspapers, "Thu Tisms," for instance, prints as the sewage of a very large video, often with a supple-ment, the aggregate smount is more than thirty zeros of printed urince per day—a quantity that could not possibly have been effected by hand-pressee. At the "Times" office there are four machines, inverted by Cowper and Applegath, printing from 4,500 to 5,000 impressions per hour; and two machines, lately invented by Mr. Applegath, printing Ten thousand copies per hour—a hand-press producing only 300 impressions per hoar. The great point obtained in these machines in the perfect distribution of the ink, and the power of cansuing the type to pass under the inking-rollers twice for newspaper work, or from four to eight times for book-

work, thus insuring the type being well loked. The effect was so striking, as to induce Mr. Cowper to apply tLe inking-roller* and table to the common press, and thin method has entirely superseded the old printing bulls, and completely abolished the imperfect tuking, technically called "monks and friars," so frequently seen in books printed by the old system. The effect of Mr. Cowper's ingenious invention is, that books are well, chenjdy, and quickly printed, an abundance of illustrations introduced. and the quality of printing improved all over the world; thus rendering literature accessible to millions.

PRINTING-AUSTRIA.

Printing, invented at Strasburg and at Mayence, and patronized by the Emperor Maximilian, who obtained masterpieces from it at its very commencement, appears in this Exhibition with a degree of splendour which has caused general surprise. No less encouraged in our day by its present sovereign, the Imperial Printing-office of by its present sovereign, the Imperial Printing-office of Austria has proved itself equal to its duties, and has accelerated the progress of the art by numerous experi-ments of all kinds. Xylography, engraving, type-found-ing, stereotyping whether by planter moulds or by means of gutta perha and the galvano-plantle process, electroor gut percent and the garden passes process, electro-metallurgy, by which fossil fishes and animals beried in the antedilavian era are reproduced upon paper; galva-nography, galvanotype, chymitype, all those new appli-cations of art and science which dimly foreshadow an nuknown future, are represented here; and lithography, that new sister of typography, also appears, with new adjuncts of chromotypy and chromo-lithography.

The beautiful and rich collection of Oriental types,

which we have counted more than a hundred different sorts, as well engraved as they are well cast, proves that in Austria learning is not less encouraged than the arts. By the side of so many objects relating to typography, we must admire the typographic plates, each measuring 540 square inches, formed by the galvanic process, and producing, in copper, letters of all languages, from which many millions of copies may be printed without any

appearance of wear and tear, M. Ilaas, of Prague (367, p. 1028), has distinguished himself by various efforts towards sustaining the long-established reputation of his house.

After the admirable display made by Austria, of numerons specimeus of well-executed typography in all languages, the Jury burdly feel themselves anthorized to express a wish that, among the great and increasing number of printers in that empire, a few had sent their productions, to show how far the art bus advanced with-out the support of the Government. The only Exhibitor in letter-press, besides M. Hans, was M. BATTAGIA, of Venice (366, p. 1028), who sent fair specimens of typoin simple and convenient binding. As pubgrapmy, in lishers, MM. bers, MM. MULLER (372, p. 1028), and NETMAN (373, 1028), of Vienna, exhibited books and albunas got up p. 1028), at vies with much care.

PRINTING-PRUSSIA.

Next to the Imperial Printing-office of Austria we notice that of M, DECKER, the printer to the Royal Aca-. Earl Stanhope, when he invented the Printing Press which will bear his name to posterity, coupled with his object an idea of inking the form on the press by means of a revolving cylinder, and in pursuit of this plan spared no expense in endeavouring to find a substance with which to cover his rollers. He had the skins of every nainful which ha thought likely to answer the purpose, dense by every possible precess, and tried many other substances, as cloth, slik, &c., without success. The nance-ssary seam down the whole length of the roller was the first impediment, and next the impossibility of keeping any skin or substance then known always so soft and plinble as to receive the light with an even cost, and communicate the same to the form with the regularity required. All the presses of bis early construction had at each each of the table a raised flanch, construction had at each end of the table a raised filanch, type high, for the purpose of applying his soliters; but the obstacles interposed by nature berself totally builted and + This may be judged of at the British Nassum, by the unique copy upon volum, printed by Kebonsperger about 13-l. It is a magnificent "Here of heures," the execution of which is even superior to that of the celebrated book of the Adventures of Teurdonck.

denay of Berliu (148, p. 1056). The large folio New Testament, the German translation by Luther, is a masterpiece of typographic art. The printing of it is perfect, the types are well cut and cust, the ink is black and brilliant, and the paper excellent. Great praise must also be accorded to the edition of the complete works of Frederick the Great, a literary and typographic moun-ment of great beauty, raised by Prussia to its hero. The five volumes in large quarto, already published, are worthy in every respect, by their typographic execution, of the importance of such a work.

M. Decker exhibited, amongst the specimens of types

from his foundry, some beautiful Oriental types, engraved in part with the co-operation of the Academy of Berlin. and also specimens of hrass rules, of great depth in the

engraving, and of very superior execution.

M. LARPHANN's ingenious invention (147, p. 1056) for printing in oil from a mass of solid colours, as a substitute for semifinid printing inks, has attracted the no-tice of the Jury, and they hope that when it has been

sufficiently improved, this may be a valuable adjunct to ornamental printing.

M. G. WESTERMANN, of Brunswick (749, p. 1091), but ** European Gallery," printed upon German Bible," in From Elberfeld, M. Barderken's "German Bible," in

From Electricas, N., DAEDERER 8 " Octions times, in folio (832, p. 1095), is a specimen of small and neat type printing. M. Harrel, of Berlin (284, p. 1065), exhibited bank-notes, and labels in gold and colours, possessing some merit.

PRINTING-SAXONY. M. HIRSCHFELD's, of Leipzic (180, p. 1113), and some

N. IHENTIFILD 8, of Leipnic (180, p. 1113), and some other typographic establishments, maintain printing in an honon-rable position in Germany.

The considerable number of publications printed in n single year by M. BROCKMATS (178, p. 1112), who is at the same time a printer, a type-founder, a bookseller, and publisher, at Lepsic, has attracted the notice of the Jury. All these publications are directed towards literary and scientific purposes, and each edition is very large. Although his printing arms less at the perfection of the art than at cheapness and correctness, we have nevertheless remarked a churming little volume entitled Lie Bezusberte Rose, by Schultze.

The books printed and published by MM. Viewen, of Brunswick (822, p. 1095), who are also type-founders and paper-makers, are not less worthy of remark for their aim at scientific asefuluess. The execution of them is without any attempt at fine printing, but is such as suits

without any attempt at nuc printing, but is well as this description of books.

M. Barte's work, "Minstels of Germany" (179, p. 1112), printed at Leipste, on parebonent, and the publications of M. Schnerner, of Frankfort (30, p. 1124), should also be mentioned. In general, the Jury have observed, in all the books exhibited in the German Department, great improvements in the paper, in the clearness and neatness of the

PRINTING-ITALY.

type, and the quality of the ink.

Printing, soon after its discovery, was carried to Rome by some German printers. The Popes Sixtns V., Leo X., and Clement XIV., founded the celebrated printing-office of the Vaticau, for the purpose of printing the works of the Holy Futhers and the Holy Scriptures, and of propagating the Catholic Faith. Their beautiful Oriental types give this printing-office an honourable standing, but its publications are few, and do not keep

pace with the progress of the times.

The Vendelins of Spires, and the Jensous, were early catalished in Venice. They introduced some happy modifications into the type by making them approach nearer to the benatiful letters of Moman inscriptions. The Aldi still further improved them, and invented the sloping types called italic. Their beautiful and crudite publications are remarkable even in the present day for their typographic execution,

At the end of the last century, and at the commencement of the present, Bodoni, a typographer of consummate abilt, who was at the same time the engerater and founder of the type which he so carefully periods, pulliabed lish beamful editions—true masterpaces—which perhaps actified too much to type-graphic hazary. Italy has sent but for type-graphic perductions to this Eabhlitten, neverbless the Jury laws creamfed with Abbey of Alucousha," abifully printed at Turin, by MM, Cannan adMar, 189, p. 1505. The type is very bountful, and each page is nerrounded by a fooder insicentury. The wood on equivalent pure to multiplical by century. The wood on equivalent pure sens multiplical by

Painting-Switzerland.

the galvanoplastic process.

Notwithstanding its flourishing trade in books, and the great number of printers established in the Cantons, Switzerland has not given the Jury an opportunity for judging of its progress in typography. PRINTERS—EXCLAND.

The first book printed by Caxton, after a long resi dence in the Low Countries, appeared in London in 1474; and it is worthy of note, that the first book in the English language was printed by him, not in England, but on the Continent, in 1471. Almost all those which he printed, and which he translated himself, to please the Princess Margaret, sister of King Edward the Fourth, and at the solicitation of the great lords and ladies of that time, were devoted to chivalry. His types, and those of his successors, Wynkyn de Worde and Pyrson, re a not very elegant imitation of the writing then used in are and very eignat institution of the writing then used in England. Up to the time of Backley, in 1733, the art of printing made. But becomes in the state of the printing inpanning to type-founding and printing, first gare to the art a real impulse. He spent several years and much of his fortune before he was able to produce types to his own satisfaction. In 1737 he insured bit first book— Virgl. in quarts. Between this date and 1763, he printed those charming editions of Milton, Addison, The Com-mou Prayer, The Bible, Juvenal and Persins, Horney, &c., which are still celebrated for their typographical beauty, and cause the name of Baskerville to be ranked among the most eminent men who have contributed to the improvement of the Art of Printing. The paper which he caused to be made was superior, and all his which he caused to be made was apperton, and an or-apparatus for printing, including his ink, premes, chases, punches, matrices, moulds, and types, were produced by himself, and were all great improvements. His process of drying and glazing his paper and ink, as soon as printed, by means of hot plates of copper, was expensive, and had some other faults; but the taste of the period was not then ripe for luxury in printing, and notwith-standing that he offered to print for the Loudon booksellers within five per cent, as low as the printers they employed, he complained that be was unable to get work employed, he complained that he was unable to get work from them. Accordingly, an 1767, we find him writing to his old friend Frankliu:—" After having obtained the reputation of excelling in the most useful art known to mankind, of which I have your testimony, is it not to the last degree provoking that I cannot get even head by it?" Then, as now, many persons would excourage had printing, because it was cheaper. His types, though rather lean for large books, were held in much estima-tion, and in 1779, four years after his death, were sold to a literary society in Paris for 3,700/., and were, in 1784, first employed in printing Beaumarchais celebrated edi-tion of Voltaire, in seventy volumes, a work at that day maurpassed in typographic luxury. Thus ended the first real attempt at improvement in England.

for real attempt of improvement is logical.

At the old of the meetry, Mr. William Bladt at a statement policy of the statement of the statement policy of the statement polic

who wished to raise in France a like monument to Racine, and printed a folio edition, unequalled for its typographical perfection.

At the commencement of the present century, the late Mr. Charles Whittingbam brought out the elegant editions which have rendered the Chiswick Press so celebrated. Until that time no one had printed wood engravings so perfectly, by the application of overlays a necessary for obtaining gradations in the tints. This success enconraped the angravers to give to woodcuts a fineness un-known in the times of Albert Durer, Wolgemuth, and other engravers, who were obliged to employ broad lines, the unevenness of the paper and the imperfections of the presses rendering the printing of fine lines impossible. At the present day, when speed is imperatively de-manded by the public, the means of satisfying this demand are everywhere numerous and powerful. This fact may be judged of in Loudon by the printing-office of Mesers, Clowes (printers of the Official Catalogues, and of the Reports by the Juries), in which two steam-engines pet in motion twenty-sia printing-machines; by that of Mr. Spottiswoode, the printer to the Queen, &c.; and by the printing-offices of "The Times," and other large London newspapers, which publish in the morning the London newspapers, which passess in the secondary the long debates in Pariament, so often continued intil late in the night. This rapidity of execution would have ap-peared fabulous in the last century; and it ought to be remarked that the speed does not, in England, in any way prevent the correctness of the work, which is in general remarkable, even in the immenso daily newspapers, This advantage must be attributed, in a great measure, to the maintenance of the ancient custom of the printers in England. Here it is required that there should be seven entire years' apprenticeship of every working printer, whether be is destined to be a compositor or a pressman, This beneficial custom, by means of which the workman becomes more skilful and more attached to his profession, is gradually re-establishing itself in all the countries in which, by reason of political commotions, it had fallen While in most other countries of Europe the patronage

of the Government agoest indisposable to the evasion or the development of a great number of binardos of or the development of a great number of binardos of the start and elector. England affords a striking listance of the other par expaids of bottom partners and developed the start and elector of the start and elector

Although neither of the great Universities of Oxford and Cambridge has taken any part in this Exhibition,

It is also possible that the system of lowering woodcuts was one of the means adopted by the engraves who were employed for the Chiswick Press, in order to facilitate good work. In 1944, the Trustees of the British Museum permitted caust to be taken of the original wood blocks engraved by Albert Durer, in 1510, of his Panic Christi, and an edition was printed in English, edited by Henry Cole, Esq. There cause use the processing the pr

the Jury must commemorate the high merit of the Clarendon Press in the one, and of the Pitt Press in the other. During a long series of years Oxford has been remarkable for the well-sustained heanty of its Greek and Latin publications, as well as of those in the English

Mr. PARKER (120, p. 544), the bookseller of the University of Oxford, has exhibited as a publisher, several works on medieval architecture, remarkable for their correctness, the beastiful execution of the wood engravings,

and the goodness of the paper. The Jury have strongly regretted, and this regret has been recorded on their minutes, that almost the whole of the printers of England have refrained from exhibiting the beantful productions of their presses, owing to the in-structions given to the Local Commissioners, which stated that printed books were inadmissible. However, some fine that princel books were insufanishlet. However, some flue specimens of good printing seen to have every in hymer chance, such as Mesers. Barnewer and Event beautions, and as Mesers. Barnewer and Event beaution to be a superior of the princel seed of the seed colour; the moulds were made expressly, the wires fluer and closer piaced, to imitate the old moulds. This is a Supplemental Volume to Pickering's Series of the Prayer, which shows all the changes made common Frayer, when shows an including much in the Ritnal from the Reformation to the Savoy Con-ference. "The Booke of Common Prayer, noted hy John Merbecke." This is a verbatim reprint, showing what parts of the service were chanted in the reign of Edward VI.; the notes are black on red ledger lines; the paper the same quality and make as the Victoria positors, cannot but prove interesting:-

Prayer-Book, but in water-leaf, that is, without size. Also the first six books of Enelid, with the diagrams and symbols printed in colours, which are used instead of tetters, for the greater case of lenners: all these are from the press of Mr. WHITTHOHAM. Mr. BAGSTER'S (87, 543) well-printed and useful "Polyglot Bibles;" Mr. MACKENZIE'S (of Glasgow) (94, pp. 543, 544) good speeimens of Church Text, illuminated with red capitals: Messrs. REED and PARDON's neatly executed specimen of their founts; Mr. SMITH's specimens of Hercules Ellis's Poetry; Major BELL's (203, p. 552) well got-np Tables of Universal History, &c. &c. Two other works must of Universal History, &c. &c. Two other works must be mentioned, as being connected with the Great Ex-hibition—Mr. BaxTreLL's (169, p. 547) Hymn for all Nations, by Mr. Tupper, translated into thirty lan-guages, and Mr. Owrs's (180, p. 549) reprint of the speech of H. R. H. Prince Albert, at the Massion House Banqaet, also translated into several European and Oriental languages,

ental languages.

The same principle which prevented the English printers from exhibiting their works has deprived the benchishers of the opportunity of taking, at the Great Exhibition of all Nations, that high position to which their beautiful and carefully divided works would have worked to be a superior of the property of the pro for ever inseparable from the history of English literature; and thousands would again have seen with satisfaction, and shown with pride to foreigners, the nunaction, and snown with price to foreigners, the nu-merous, cheap, neatly printed, and beautifully Illustrated productions of Mr. Charles Knight, who in ministering to the intellectual wants and pleasures of the people, has given in the right direction an impetus which is still felt in all hranches of art and manufacture connected with

this Class. The following statistical Tables by Mr. Edward Edwards, Secretary of the London Society of Com-

Mr. Swage, in "Hints for Decountive Printprinting, Mr. Swage, in "Hints for Decountive Printprinting, His recipes for anking coloured his say, however, incorrect; and although merit is due to him for again calling the actualism of printing relative printing. His register of the printing for again calling the actualism of printing repulsed to the printing of the printing of the printing grant printing and the printing of the printing register of the printing of the printing register, and the printing of the printing register, and the printing of the printing register, and the printing redistribution of the printing retained as long against and the risk book was pair.

The greatest impulse given to colour surface printing in this country, was during the existence of the state lotteries, about 35 years ago. The late Robert Branston, wood-engraver, and the late James Vizetelly, then employed at Mesers. Gye and Baine's printing establish-ment, greatly promoted the demand for coloured and ornamental printing, the one by his skill as an artist, and the other by his constant endeavours to produce striking the other of his communications to produce a straining effects by means of colour printing; a great emulation for ornamental work being created by the lottery contractors, who yied with each other to render their lottery tractors, who vied with each other to render their lottery seebemes more and more attractive. Mr. James Whiting, sen, who was one of the principal printers for the Government contractors, also produced great novelties, and subsequently, in conjunction with the late Sir William Congreva and Mr. Branuton, established the extensive printing-office of Beaufort House for all descriptions of printing of the printing and particularly for protection against forgery. The case No. 123, Class XXX, exhibited by his son, Mr. Charles Whitton (p. 829), contained some beautiful specimens of relief engravings reudered more difficult to imitate by the sid of the rose engine; cameo embossing,* in which the surface of the die is inked; and compound plate printing,† at one im-pression, in two or several colours, by plates constructed to combine with wonderful accuracy at the moment of taking the impression, by cylinder steam machinery: these plates are similar to those so long in use at the Excise and Stamp Offices, and which are of such great durability, that the medicine label plates now in use have produced millions of impressions during the last 25 years, and are still in daily use at the Stamp Office. It was by the aid if this machinery that Mr. Norman, of Frankfort, and Mr. Henel, of Magdaburgh, were both enabled to

* Cameo embossing was re-introduced by the late Mr.

Branston.

7. Double-Culous Printings Plankins. — When Sig William Congreva was engaged in centriving a method of printing stamp in two colous, for the prevention of forgers, for the two colous, for the prevention of forgers, for the Doublin for the askinatory and JM. William, who afterwards became that greatleman's partner, ferented an apparatus, and made a deligit for a materiate for the above pumpers, greve, a model was made, ball size, at Menra. Doublin's work, namel: the direction of JM. Wilks, and in 1820 and set to work at SP William Congreve's residence in Ceell Towns, and afterwards about to the Manuan at Worleich.

introduce these principles of printing late their respective countries, the dies and plates being furnished by Mr. Whiting; those gealtener were not only greatly remuciate the production of the principles of the principles (Governments for the Introduction of what was the as new art to those countries. It would be difficult to find any other concerns are the alapsel for revery that all beam of the concerns and the conception of the principles of the mert by Mr. Whiting, sen. Ser William Congreve, and Mr. Brinston; and the case exhibited sufficiently detailed to the contribution of the contribution of the contribution. All the contributions are the contribution of the Mr. Brinston; and the case exhibited sufficiently debaniums, fully malestain is twell-extract reputation.

When the English state lotteries were asfolished, ornamental priming [26] growly into disses, and it was not mental priming [26] growly into disses, and it was not printing playing earls, that there was any revival, great fellities being given by the improved coloured inda which he introduced, and which are described in his pecifications. Since this period might and necessarie imperimental properties of the properties of the prosent properties of the proteed of the properties of the pr

Nothing can be more beautiful and more perfect in execution than the charming plates printed in coloura by Mr. Baxrac's process (172, p. 548); but the articles having been placed in the Class more especially relating to the Fine Arts, it is in that Class that an account of their merit must be snoght for

M. SILERDMANN (GT4, pp. 1194, 1195), of Stream burg, has exhibited productions, some of which are produced by the stream of the stream of the stream printed windows of the Straberg Chiledral, and some intuitions of manuscripts, encircled with coloured vignettee by surface printing. Others, again, are to be soldiers, of which a hundred and unterty thousand sheets are annually issued, and find a sale in France, Germany, and Fogland.

A geological map, coloured with time distinct tints; a table representing the effects of the contrast of colours, the employment of which has found a felicitous application in the work of M. Chevrent, Member of the Institute, and other prints executed by this process, prove that science, as well as the arts and commerce, will profit by this branch of industry. In addition to the Printers already mentioned, who, he

PRINTING-FRANCE.

As early as 1470, printing was introduced into Paris by the influence of La Sorbonase; its progress was rapid. Rembold, the partner of Gering, Autoine Virard, Simon de Colines, Pigonochet, and others, carried the art of printing to a high degree of perfection. The typeraphical merit of the publications of Robert and of respects were it not surpassed by the high literary merit of those learned printers.

The Camsania, the Dekissors, the Counteilers, and the Barbons, maintained the good traditions of the survivery printers: and towards the end of the last century Ampriting of the Confection of the Proceed Cassies, called the Dusphin Collection. From the united labour of the Dusphin Collection. From the united labour of time of the Confection of the Proceed Cassies, called the Dusphin Collection. From the united labour of time of the Confection of the Confecti

Now, however, in most countries, by the effect of competition carried to its atmost times, the distinctive, original, and personal characteristic of the melect typical, and personal characteristic of the melect typical control of the division of labour does not permit them now, a formerly, to cat and cast the type themselves, to make their own ink, to superinteed the construction of their presses, or ink, to superinteed the construction of their presses, to show them bow they should be used; to a knowledge of these technicalities many of the necestar printers united of these technicalities many of the melectar printers united

extensive literary acquirements.

The concentrate all the ferrits and all his political span one only of the branches white combine to form the art of the processor of the branches white combine to form the art of the processor of the branches white combine to form the art of the processor of t

single branch of the art, the results are satisfactory.
The National Printing-office of France was founded in 1610 by Louis XIII., who there collected the punches cut by Garamond by order of Francis I., and confided these punches to the most realizest printers of his time, who were honoured with the title of Royal Printers. Under the preceding regions this printing-office had dis-

tinguished itself by large publications, such as the collection of Ordonnances of the Kings of France, that of the Pathers of the Church and of the Councils, and that of the Byzantine Historians, &c. At the fall of royalty it became a vast establishment, in which was concentrated all the printing of the Government departments, divided hitberto among private printing-offices. Napoleon confided the direction of it in 1809 to M. Marcel, who had accompanied the expedition to Egypt, and had founded a printing-office at Cairo. Making use of the types of the Propaganda of Rome, which had been removed to Paris, M. Marcel printed the Lord's Prayer in 150 language It was especially under the reign of Louis-Philippe that the printing-office, then a royal establishment, improved its means of execution, and caused a great number of Oriental types to be engraved under the special direction of the most learned Oriental scholars, such as MM. Burnouf, Mohl, Ilase, &c. All the types are remarkable for their beautiful execution, and for the happy combinations which, without impairing the purity of form of characters, has simplified their cutting and facilitated their composition. We may particularly instance the hieroglyphic character, composed of 2,400 punches, with which all the Egyptian inscriptions can be reproduced; and the Assyrian character, the decomposition of which has brought down to 100 the number of punches necessary to form its various combinations. The 150 foreign founts in the specimen-book of the National Printing-office offers an interesting subject of comparison with the rich collection of the Imperial Printing-office of

gold and in colours, in imitation of the drawings and vignettes of the elegant Oriental numancripts. It is to be desired that the National Printing-office of 100 to be desired that the National Printing-office of Office of Austria, and of the manafectures of Strees and the Goldelins in France, should successively increase in the store of foreign type, and devote itself more especially to very kind of experiment relating to typecially to very kind of experiment relating to typethe co-operation of learned mer and good artists, wen-

Austria. The Jury have particularly remarked the peretaste and perfect execution of the borders printed in

be honourable for a nation like the French.

The typographic execution, with reference to the typographic execution, with reference to the types, the harmony, the elearness, and the parity of the designa executed by MM. CHENAYARM and CLEMET, is perfect. Nothing can be more beautiful than the three volumes of the Oriental Collection sent by the National Printing-office. These are:

1st. The First Book of Kings. 2nd. The First Volume of the History of the Mongols. 3rd. The First Volume of the Bhagavata Parana.

The Jary have found the bookselfing business of Paris bonourshly represented in this Esthibition by MR, RENGEARD (p. 1194), BRILLERE (p. 1197), and GARNE (p. 1209), for the vicence and Hierance; by MR, LANCALORS and LECLERGE (p. 1190), and by M. PARNARRE (p. 1293), for cleantaceal overla; by MM, BANCE (p. 1293), for the Chantaceal vortex; by MM, BANCE (p. 1295), GEORG (p. 1196), and CHARLER TEXAS (p. 1295, b) indicated and celestrate Harvey, so untilarly halped to the visual of mechanical science; and, lastly, by Madame HEARD, for Works upon agriculture.

Amongst other works, the Jury have remarked the edition of Hippocrates, in Greek and French, forming seven octave volumes; and the first volume of the edition of the Greek Physicians, issued from the press of the National Printing-office. Mallalizar [p. 1197] is the publisher of these works, as also of the Anatomy of the Human Body, by Cravethier.

SLIBERMAN (pp. 1194, 1195), who has contributed to improve the art of surface-coloured printing; by M. DESROSTARS (p. 1219), who is a small provincial town has produced his "Ascient Aurergoe," &c. in a very creditable manner; and by M. Basnar (p. 1229), who exhibits illustrated volumes of the Scriptures.

PRINTING-SPAIN AND POSTUGAL.

The Jury would have been gratified to see displayed in The July would nave over grathers to see unpured in the Exhibition any typographical production executed in Spain,—the country which in 1772 produced at Madrid the superh edition of "Sallust," printed in such perfec-tion and on such beautiful paper by the King's printer, Josehim fbarra.

It is in Spain that the most ancient manufactories of

paper known in Europe were established.

The same feeling is to be expressed as regards Portugal, for the Jary cannot consider as a specimen of Portuguese printing the sample exhibited from Madsira, under the title of Amostra de Impressa, though every beginning, however small, ought to be encounaged. The printers of Lishon might have sent some well-known editions of their classics.

PRINTING-BELGICK AND THE NETHERLANDS. Printing was introduced into the Low Countries at the same time as into England. Martin d'Alost, in 1473, and the Brethren of In Fie Commune, at Brussels, published the retented of he be Commune, at Brunets, published their first works. The art of printing made rapid pro-gress in the skilful hands of Jonnes de Westphalis, in 1474, at Lonvain, and soon extended itself to Antwerp, Andensude, tihent, Bruges, Hasselt, &c. Towards the year 1534, the Plantins at Astwerp, and, in 1616, the year 1554, the Plantins at Antwerp, and, in 1010, the Elzevirs, first at Leyden and afterwards at Amsterdam, carried the typographic art to such a degree of perfection, that their publications are still sought after throughout the whole of Europe. The Wetsteins, the Biscuux, and the Moreti (who, being eamobled, received permissions to continue the art of printing without derogation to their nobility), were emplators and successors worthy of them. The political events of the seventeenth and eighteenth cenand positions trained a baneful influence on the progress of typography, which revived, particularly in Beigium, in 1815. The number of able printers increased considerably in both countries; and, store 1850, Beigium has witnessed with satisfaction the annual increase of original publicaons, notwithstanding the unfavourable position in which the publishers are placed from the competition of the orints of foreign works. Such, however, is the influence of the development of a national spirit, that during the last twenty years the Belgian press has issued a greater number of original works than in the 150 years which preceded the recognition of the independence of the

Amongst the printers of Belgium, where the mechanical part of the art is good, the town of Malines has long since part of the art is good, the town of Nalmes has long uncer made itself known by its Prayer and Littergie Books, successfully and economically printed in red and Mack— thanks to the incessant labours of M.P. T. Hanieq, Typo-graphy is also represented in the Exhibition by the well-printed Bibles and Testaments of M. Brians, of Ixelies (p. 1199); the illustrated books and woodcuts of M.

• By a singular coincidence these three were pupils of the typegraphic establishment of M. Firmin Didox. the property of the control of the control of the control of the of 1,500 volumes always ready, throughout the year they produce 15,000 volumes per day, averaging 200 pages each volume. They have 20 steam grillinds muchines, one ma-chine turning out 14 reams of printed work per hour. All the wood engraving is done in their establishment: they employ 1,200 persons.

TANAR, an art recently cultivated in Belgium; the TANAS, an art recently entitivated in Belgium; the Mussal of M. WIPTARL LEARNS, ON Numer [2, 1160]; the chop publications of M. K. Germans, at Tomasy the Belgium of the Company of the Company of the Company of the Statistical Tables of the Population and Agriculture of Belgium of M. LEASINE [9, 1150]; the Allows & Prosbosic of M. Pazarser [9, 1150]; the Allows & Prosbosic of M. Pazarser [9, 1150]; the cilians of the Statistical Tables of the Statistical Tables of the Statistical Statistical Tables of the Statistical Statistical Statistical Statistical Tables of the Netherlands have sent specimens of their productions. The sent and chapt filled on the Statistical Statist

ENGREDE JOHANNES and SON (p. 1146); the curious Journal of the Embassy of the Earl of Portland in France, printed by M. NOSHDENDORP, at the Hague (p. 1149); and the "Graduale Romanum," and "Antiphonarium Romanum," by M. Zwersaardt, of Amster-dam (p. 1149), have been remarked by the Jury.

We will also mention the continuation of the voluminous publication of the "Lives of the Saints," com-menced by Bollandus, and forming fifty-three volumes in folio. The first of these enormous volumes, printed in 1845, is entirely devoted to the Life of St. Theresa. It is satisfactory to know that this great enterprise, supported by the Belgian Government, is to be continued, as it equally embraces religion, history, and geography.

PRINTING-DENMARK.

The Jury have not been able to judge of the state of printing in Denmark, that country not having sent a single printed book. There was only an ingenious machine for composing the types after an entirely new system.

PRINTING-SWEDEN.

M. BROLING, the printer to the Bank of Sweden, exhihited specimens of printing bunk-notes by letter-press, of superior merit from their varied combinations, brightness of colour, good register, and the difficulty thrown in the way of forgery by the different processes employed.

PRINTING-RUSSIA

A single broadside sheet from St. Petersburgh exhibited specimens of several Russian and Oriental characters surrounding a vignette on wood, representing varieties of the Russian people. The whole is neatly printed.

PRINTING-GREECE.

It is to be regretted that the typographical productions of Greece were not exhibited amongst those of other civilized nations. A printing-office was established at Athens at the time of the independence of Greece. At this Exhibition, Greece has confined herself to inscribing upon her banuers, in large letters, the sentences

from her aucient poets as the harbinger of a better future:-Sapail yek váy alem leető ápton. Zahai di es ptívna ptívne

Eig Egum emulert'. 'Ayati F les Els Berries.

PRINTING-PERSIA. Enrope might have possessed the art of printing ever since the year of our Lord 1310, had she been acquainted with a work by Richid-ed-din, who, as far back as that period, had described the process of printing as known to the Chinese, in his Persian work entitled Djemma's etterrarikh,

Persia has sent to the Exhibition some beautiful mannscripts only, and some books printed in Europe; uever-theless, the typographic press is not unknown in that country, since a newspaper in the Persian language is published there.

PRINTING-EGYPT.

Whilst at the present day the ancient languages of Egypt are printed in Europe with hieroglyphic, Coptic, or Greek characters, it was interesting to see displayed in the Exhibition in London, 165 volumes of all rizes, printed in Arabe, in Turkish, and in Persian, at Cairo

(the ancient Memphis)." Amongst these books we have arked some which are enriched with arabesques, tastefully executed by means of typography. ratify executed by means or typography. In which are printed upon a peculiar paper, manufactured at Boulac, by the old vat process. The pulp appears to resemble that which is obtained in China and in India by the use of raw materials, such as the bamboo and the bansua tree. It may be that the ancient papyrus is now re-appearing in Egypt under this new form. Amongst the Arabian books, devoted almost entirely to military science, Áraban booka, devoted almost eatirely to ministry scenes, mediciaes, geography, and celeation, the Jury have remarked. The History of the Kieps of France contemporary Empire, and the Control of Malle Le Bras. The Treatist of Good Advice: On the Care of Little Children: The United with The Control of Malle Le Bras of the Control of the with a few engravings, also executed at Boulac.

PRINTING-UNITED STATES OF AMERICA. It is well known that there are some works printed in the United States which give a more favourable idea of the productions of America than those which have appeared at this Exhibition. The Americao printers have contented themselves with sending a number of newspapers, the printing of which is not remarkable. Even the lowness of price has nothing surprising in it, as there is no stamp duty, neither is there any tax npon paper.

Painting-Canada.

In the collection of articles exhibited by Canada, we have observed a specimen book containing a large number of beautiful types from the foundry of Mr. Palsonave (189, p. 968), at Montreal. He also exhibits some stereotype plates.

Perspress Appress

The Jury have examined, with real interest, several works printed in Van Diemen's Land, at Hobart Town, some of them by HENRY DOWLING (331-33, p. 999), such as the Tusmanian Kalendar and the Tasmanian Joursuch as the Tassonston Kalendar and the Tassonston Journal, in 800, and two large volumes, accompanied hy lithographs, likewise designed and printed in Australia; and the execution of which is astisfactoral Ordinances of the Goernov and Council of New South Woles, printed at

Sydney, in 1844, by William John Row (4, p. 999), with types cast at Sydney. It is to be regretted that, introduced as it now is even

to the confices of the earth, all the productions of the press have not been represented in this universal gathering; for printing is a gift almost as necessary to man as speech, for the manifestation of his thoughts.

New Process relating to Galvanoplustic, Galvanographic, Galvanoglyphic, and Chemitypic Printing. The Imperial Printing-office of Austria has exhibited

the whole collection of the new applications of the typothe whole concerns of the new applications of the typic graphical art, such as the galvanopisatic process, galvano-graphy, galvanoglyphy, and chemitypy, which, bringing their co-operation to the aid of typography, comble it to reproduce, in some degree, nature itself. It may therefore be said that these new branches are to typography what photography is to the art of drawing.

The Galegmondaric Process.—We have, for instance,

seen antedillavian fishes reproduced noou paper, at this Exhibition, with the exactness of nature itself. By means of successive layers of gutta perelta applied to the stone inclosing the petrified fish, a mould is obtained, which being afterwards submitted to the action of a galvanic battery, is quickly covered with coatings of copper, forming a plate spon which all the marks of the fish are reproduced in relief, and which, when printed at the typogra-phic press, gives a result upon the paper identical with the object itself,

M. HULOT (p. 1222), a mechanist and chemist attached

* At Boulac, a suburh of Cairo,

to the Mint of Paris, has exhibited some sheets, each of them containing three hundred heads intended for nostage stumps, which are impressed at one stroke, from a plate of brass of a single piece, containing these three hundred figures in relief. By a peculiar process, M. Iluloi suc-ceeds in identically reproducing, without the least con-traction, the original engraving, which is on steel, but which might be engraved on any other metal, or even on wood. It is by this same process that M. Hulot has re-produced, for the Bank of France, the notes engraved in

relief in such perfectioo by French artists, Galesus groups. — The Austrian Printing-office has shown us some remarkable results of this process. An artist covers a plate of silvered copper with different coats of a pasut composed of any oxide, such as that of iron hurnt terra sieuna, or black lead, ground with linseed oil. The substance of these coats is of necessity thick or thin, according to the intensity given to the lights and shades. The plate is then submitted to the action of the galvanic battery, from which another plate is obtained reproduc-ing an intaglio copy, with all the auevenness of the ori-ginal painting. This is an actual copper-plate, resemginal painting. This is an actual copper-plate, resem-bling an equatint, and obtained without the assistance of

the engraver. Galeansolyphy. - The experiments in galvanoglyphy nre no less interesting. Upon a plate of risc, conted with varnish, a drawing is etrhed; then, with a small composition roller, a cost of ink is spread upon this varnish and left to dry. The ink is deposited only on those parts where the varnish has not been broken through by the graver, and leaves the annken portion of the engraving free. When the first layer is dry, a second is applied free. When the first sper is dry, a second is applied, then a third, and so on, must it is considered that the parel is placed in the parket is placed in the galvanie fastrery, and another place is the result on which all the hollows of the engraving are reproduced in relief. This relief is more or less mixed as the result on which all the hollows of the engraving are reproduced in relief. This relief is more or less mixed as the result of the relief is the result of the relief in the relief in the relief is the relief in the relief in the relief in the relief in the relief is the relief in the re

from an engraving, the process of chemitypy is equally ingenious. A polished sine plate is covered with an etchingenious. A polished sine plate is covered with an etching ground; the design is etched with a point and bitten in with diluted aquafortis; the etching ground is then removed, and every particle of the acid well eleaned off.

For this purpose the hollows of the engraving are first washed with olive uil, then with water, and afterwards wiped, so that there may not remain the least trace of the acid. The plate, on which must be placed filings of fasible metal, is then heated by means of a spirit-lamp, or any convenient means, until the fusible metal has filled up all the engraving; and wheo cold it is scraped down to the level of the zinc plate, in such a manner that none of it remains except that which has entered into the hollow parts of the engraving. The plate of sinc, to which the fusible metal has become united, is then submitted to the action of a weak solution of muristic acid, and as of these two metals the one is negative, and the other posi-tive, the zinc alone is caten away by the acid, and the fusible metal which had entered into the hollows of the engraving, is left in ralief, and may then be printed from

hy means of the typographic press.

Passiconography.—This is a new process, invented by M. Gellor, of Paris (p. 1201), and coosists of a method of reproducing, hy means of the typographic press, any lithographie, autographie, or typographic proof, any drawing with erayon or stump, or any engraving upon wood or copper

Upon a plate of zinc, polished by means of pumice-stone, the artist executes the required design with lithographic crayon or ink, or transfers impressions from lithography, wood-engraving, or copper-plates. The surface is then inked over with a roller, so as to increase the thickness of the ink, which is afterwards consolidated by dusting finely-powdered rosin over the plate, by means of a pad of wadding: the rosin adberes only to the ink, and a pag or wassing: the rosm storers only to the life, and is readily removed from the other parts of the plate. Afterwards, for the purpose of obtaining a relief block, the plate is placed on the bottom of a shallow trough, contaioing very dilute sulpharic or hydrochlorie acid. By means of a rocking motion given to the box, which for that purpose is fastened to an axis, the acid is caused to pass slowly and continuously to and fro over the sarface of the plate. After the lapse of half ao hour, if it be a crayon drawing, the etching is completed, and a relief block is obtained, in which it is only necessary to remove the large whites by saw-piercing. In case, however, of the plate cootaining writteo matter, or many very fine lices, it is necessary to withdraw it from time to time, and again ink the surface with lithographie ink, and dust the powdered rosin, so that the edges may be protected as much as possible from the undermining action of the acid; these operations must be repeated until the neces-sary depth is obtained. Transfers may be made from very old impressions of wood-engravings by sponging them several times at the back with acidulated water, and then operating as is usual with lithographic transfers. Music Printing.—As early as 1490, music was printed by letter-press. The edition of the Paalms, printed at Mayence in 1490, had the music (plais chant) in two colours, the notes being in black and the ledger-lines io red. The shape of the ootes in this edition is different from the square notes subsequently adopted for sacred music. The notes of the music executed by Peter Hautin, an engraver, typefounder, and printer, were lozenge-shape, nd each note was cast separately with the ledger-lines. Peter Attaignant, of Paris, printed, in 1830, twenty-oine sougs with this description of music. In 1852, Adrian Leroy, musicise to Henry II. of France, and Robert Ballard, his brother-io-law and partner, obtained the title of King's printers for music. The types were engraved by William Le Bé, an eminent artist of that period, and were

on the same plan as those of Peter Hautin.

Io 1579, Aogelo Gardaoo printed in Venice, from music types, the "Madrigali à sei roci di Sabino." The process was the same as Peter Houtio's, but the exercision was very inferior. The opera of "Theirs," the music by Lulli, was printed by Ballard in 1688; the typographical execution was imperfect. The same work, io folio, was printed in 1720, by Beansenne, from eopper-plates, and was so superior to the music prioted from types, that the old method was abandooed for that of printing from en-graved plates. The exclusive privilege granted to Hallard was malotained in his family, without opposition, until 1639, when Sanlecque, another engraver in Paris, obtained letters patent from Louis XIII, of France for a ten tained letters patent from Louis XIII. of France or a ser-year's slot right of printing the pleis chest music by a new process of his invention. In consequence of this pateot, copper-plate music prioting superseded typogra-phic music printing as early as 1675. In 1746, M. Dornel, organist of the church of Ste. Generablev, Paris, entered organist of the church of Ste. Generiève, Paris, entered into partnership with M. Klebin, an engraver and type-founder, for the purpose of casting masic types io sand. By this kind at sterotyping the printing appeared to possess some advantages, but the plan was nbandoned. In 1764, M. Breitkopf, a type-founder and priotes at Leipnic, succeeded in casting music types. The electronal Princess of Dresden was so much pleased with his plan, that she gave him to priot the music of a drama of her own com-position, called "Il Trionfo della Fidelta." In this type music the notes were each composed of separate pieces; and in Germany, until theo, there had been only one piece for each note and ledger-line. The system of custing mosic with the cotes separately possessed some advan-tages, although the composition was tedious and the founts costly. At the same period MM. Enschédé, of Haarlem, caused M. Feischman, an eminent artist employed in their foundry, to engrave music types, the perfection of which has scarcely been surpassed; but the system which they adopted was too complicated for general ase. Io 1762, M. Rosart, of Brussels, being desirous of diminishing the number of pieces, cast a new foont of music with anly 300 separate sorts. M. Fournier, jun., further improved the casing of masie types by reducing the oumber of types to 160. At the sitting of the Royal Academy of rance in August, 1762, these improvements were ooticed

M. Reinhard, of Strasberg, obtained a patent for a new process of printing music; he printed the ledger-lines from a punch-cutter and type-founder, caused some improve-

surface engraved plates, and the potes from movemble types. The work was good, although the notes were of different tint from that of the ledger-lines, in consequence of the two prietings. About 1810, M. Olivier, a French engraver, produced beautiful proveable music types, hot engraver, produced beautiful novemble mass types, hot the mechanical difficulties of setting up rendered this plan nucless. In 1832, M. Daverger, of Paris, invented an improsious mode of casting the ootes separately from the ledger-lines. M. Daverger's plan was to compose a page of music without the ledger-lines, he then took a phater cast, and with the sid of a straight edge he railed lines in the plaster with a graver to the same level as the surface of the notes; he then cast stereotype plates, and thus obtained perfect music pages for surface printing. MM. ossamed percet mine pages to surface printing. MM.
Tamtersten and Cordel, papils of M. Duvreger, invented
another method of producing music; they set up the
music with moveable types combined with the ledger-lines;
they thus took plaster easts, and simply replaced in the
plaster the imperfections in the ledger-line joints, previous to stereotyping. Good specimens of this system were in the Great Exhibition

The music types of Mesers. Sinclars, of Edinburgh, did not possess any novelty, but their execution was

M. DERRIEV, of Paris (185, p. 1183), is the only exhihitor of music types showing any marked improve-ment. The notes were cast either in one or more pieces, so as to admit of the ledger-line crossing the cotes when they were required to be on the line. Each ledger-line was so one piece, and of the full width of the page, either in brass, zinc, or hard type metal. Music prieted from such types is a ocarer approach to impressions from engraved plates than any hitherto produced, yet it is doubt-ful whether by continued wear the interstices may not become visible, and render this system imperfect.

Notwithstanding the many attempts for the improve-ment of music types, several difficulties have yet to be surmonated before music printed by letter-press can equal that which is printed from cograved plates. Good work is produced by transfers of engraved music on lithograc stones, although the cost of printing is greater than by letter-press.

Punch-cutting and Type-founding. Io the earliest books prioted in Germany, the shape of the letters was at first Gothie; they were then rounded and became semi-Gothie. In Italy, under the infinence of the Roman ioscriptions, and of the beautiful manoscripts of antiquity, their form was completely changed, A Frenchman, Nicholas Jenson, engraver to the Royal Mint of France, was sent to Mayence, in 1462, hy Louis XI., to learn the secrets of the new-born art of printing. Civil commotions having prevented him from introducing this art into Prance, he engraved in Venice, for the printiog-office which he there established, the beautiful types of Roman characters which Garamond afterwards took for his models, and from which models it is scarcely possible to depart, without falling ioto extravagance or bad

Io England, Caxton adopted, for prioting his works apos chivalry, a style of letter in imitation of the hand-writing of that period. Autoine Verard printed his works o France at the same period, with types very similar, but better cut and better cast. Both seem to have been de-sirous of giving fac-similes of the manuscripts of their

The Roman characters adopted by the Aldi, and by the Stephani, caused the semi-gothic shapes to fall into dis-use; and it was the elder Aldus who loveoted the italie character, which was engraved by Francis of Bologua, after the beautiful writing of Petrarch. aner the beautini writing of Fetraco.

The Elzevirs employed for their works types cugraved by Garamond and Sanlecques.

Ibarra io Spain, Baskerville in England, and Enscheld

in Haarlem, modified the form of the types in accordance with the then prevailing taste. Of these the letters co-graved by Easchédé and Fleischmann, ot Haarlem, are ery remarkable specimens.

At the close of the last centery, the younger Fournier,

ments to be made in this art, which he has described in his Munal.

and state the state of the stat

and in the engraving. In 1823, M. Lonis John Pouchée took out patents for the three kingdoms for a machine for easting type, co sisting of a mould formed by a combination of steel lears with grooves and matrices, secured by a frame and a brace of iron upon a strong wooden bench, and a lever carrying a heavy rammer, to fall down into the mould, for the purpose of forcing a portion of the fluid type metal, which had been poured out of a ladle into the receptacla between the ends of the grooves (each groove forming the mould of a separate type), through small apertures into the grooves and matrices (placed at the opposite end of the grooves) where the body and face of the letter are By this apparatus about 200 types muy be cast at one operation, and the casting repeated twice in a minute, or even quicker. M. Pouchée, having cast a large quantity of type by this machine, offered the type for sale, and the printers refused to purchase unless at a reduced price; M. Pouchée preferred melting it. At the sale of M. Pouchée's type-founding effects, a quantity of this machine-cast type (which had escaped melting) was sold, and was ufterwards discovered to be machine-cast by a private mark on the side, and an after-cut nick. The machine was not offered for sale. But Mr. Reed, a printer in King Street, Covent Garden (related to Mr. Blake, of the firm of Blake and Stephenson, type-founders at Sheffield), was employed by the type-founders to negociate with M. Pouchée for the purchase of the machine, which was effected for about 100/. The machine was conveyed to Messrs, Caslon and Livermore's and destroyed, on which condition it was purchased. There was included in this purchase a valuable planing-machine, and cross-entting machine for cutting the grooves. It was the invention of M. H. Didat, to whom M. Ponchée paid 48,000 francs fur the patent right in England.

The Equilib punch-cutters, whilst retaining depancies their type, endourses to make them more durable, and prolups more legislis, by stronghening the fine stricks and prolups more legislis, by stronghening the fine stricks and the stricks of the strick of t

Mr. Whitingham, at the engention of Mr. Pickering, first reintrolescelled the old letters of Garmond and Jenson, and many of the London printers have since followed; some very beautiful work have a sleeply been printed with some severy beautiful work have a sleeply been printed with some severy beautiful work have been printed to be considered to be a sunfactories of paper, for in places of the beautiful paper called release, the evenues of which is perfect, the English papilies at the present day give the preference been module as much as at a period when the waving of we want to throughly indertexed.

Since the invention of casting types by Peter Schoeffer

a process which goes back as far as the origin of printing itself—this art has made little progress. It was only

at the commencement of the present century, that a slight improvement resulted from the use of the mould called the American mould, which renders the work of the founder somewhat more cosy. In 18% M. Framin Didot invented the sloping mould,

In 1804, M. Firmian Dided introcated the eloping mould, with a salient and returning angle, and by an ingueined with a salient and returning angle, and by an ingueined combinations, succeeded in institute [English hand-orling, which presented the greatest difficulty, and in completed to the compact of the present of the salient of the comtraction of the salient and the salient and the salient time terrover each letter visible, an obstacle which had till then presented the success of every statement of this dartered progress in the sort, and nest with great success in Europe. Copper-paint engraving and influençuely alone can vie with the perfection of the system.

can be with the perfection of this system; can be the state of the perfection of this system; convenied as companioning model, and afterwarist the annual which he muscal polyamityte—by means of which 1 to letters as usual polyamityte—by means of which 1 to letters as which requires great accountry and great ears, in ourbre to first model, which requires great accountry and great ears, in ourbre to give accountry and the advantage of the state
the merit and the difficulty of type-founding.*
We had an opportunity at the Exhibition, of seeing M.
Brockhans' mechanical mould, which he has employed
with networs for a long time in his own printing-office,
with networs for a long time in his own printing-office,
the platten of the mould acts horizontally, and in the
ther particular. The injection of the melted material is
accomplished in each by means of a piston working in
the metal pot, and driving the material hriskly into the

In 1844, M. Marcellin Legrand exhibited in Paris n series of 4,600 punches, and the same number of matrices, for the purpose of reproducing all the signs representing the words of the Chinese language. This system, which consists in adding to the piece representing the kry another piece which modifies it, has completely succeeded, for it has been adopted not only in America, but in China itself, and at the present minnent works are printed at Macao, and at Ning-Po, with the types engraved by M. Legrand. We have seen in the Exhibition the Gospels printed in China by the Presbyterian Missionary Society of America. M. Marcellin Legrand was the first to undertake singly this immense labour, by means of which Chinese writing is brought within the compass of European typegraphy. A printed table, in which each word is accompanied by a eipher, is now sufficient to indicate to the workman the cipher corresponding to the word. Each of the types is arranged in the case in numerical order, and buars upon its side a number corresponding with that of the table, thus facilitating the mounal labour, and preventing many There was also in the Exhibition, a page printed in the Chinese types engraved by M. Auguste Beyerhaus, of Berlin. By means—1st, of 1,200 punches and matrices espable of combination; 2ndly, of 2,400 characters, each engraved in a single piece; 3rdly, of 105 others, called perpendiculars, he composes 25,000 different characters. The characters in this system are always divided perpen-dienlarly, whilst in that adopted hy M. Marcellin Legrand some of the divisions are perpendicular and others hori-

 There may be other reasons; for it is well known that the invention patented in this country could be successfully worked. Mesers. Figgins, who purchased it, have altotained from putting it in practice, probably in deference to the journeymon type-founder. zontal. This system, judging of it by the printed pane displayed at the Exhibition, appears to be successful. In point of execution, it leaves nothing to be desired; and Mr. William Wells, an accomplished Chinese schular, residing in that country, has bestowed great praise upon M. Beyerhaus has also eugraved an Egyptian type, at the suggestion of M. Bunsen. The characters of it are open, whilst the two founts which the National Printing-office of France has had engraved are black (en sil-

The Imperial Printing-office of Austria, decomposing each part of a Chinese word into as many pieces as it contains strokes of the pen, reconstructs the words by means of these little pieces, which the compositor groups together so as to construct any Chinese word. The number of points and strokes is about 400, and they uppear to

be a most complete system of Chinese typography. Nearly all the languages of the world were typographically represented either in the specimens of the National Printing-office of Paris, in the numerous tables of the Imperial Press of Austria, in the Bibles printed in almost all languages by the Bible Society, in the specimens of general type-founding at Paris, in those of M. Decker of Berlin, or in those of the English founders, and especially in those of the late Mr. Watts of London, who has himself engraved an extensive series of Oriental types, which are an honour to his type-founding, and form the richest series of this kind existing in any private establishment,

Amongst all the types which express the gift of speech, the most numerous and complicated are those of the Chinese language, in which every idea and each word is represented by a different character. Owing to typography, there will soon be no single idiom which may not be saved from oblivion; for typography contributes to the preservation of languages as essentially as slid the press of Guttenberg to the preservation of books at the

me of its discover The Jury have, in this important branch of art, remarked the productions of the following contributors: Endant. Mesers. Carlox and Co. (78, p. 543), exhibited a great variety of beautiful types; Mesers. Duncan Sinclair and Son (92, p. 543), specimens of general excellence; Messrs. Figgins (124, p. 545), types of great excellence and beauty; a super-royal form ec taining 220,000 pieces of pearl type, locked up and showing the care bestowed in finishing, in order to insure correct justification; and a specimen of curious and newlycut Todor type, imitating the inscriptions from monu-ments and tombs; Nessrs. MILLER and BICHARD (150, P. 546), a specimen of ruby type, in which "Gray's Elegy" is printed, thirty-two verses in two columns, occupying 3½ inches in length; Messrs. Bestar and Co. (193, p. 550), a great variety of beantiful and original types, among which a complete series of Elizabethan, or church text, as well as the typographical ornaments taken from the remains of Nineveh and Etraria. The Jury also mention the specimens of Messrs. Fangraos BROTRERS (90, p. 543); of Messes, Stephenson, Blake and Co. (182, p. 549); and a curious fount of compli-cated type of the euneiform character, used in the Babylonian inscriptions, exhibited by Mesers. Hannson and Son (212, p. 552). Mesers. Kino's new music (22, p. 537) presents an improvement, the result of having very few kerned types. Mr. Arasyzono's illustrated music offers no peculiar character.

France,-M. DERRIET (p. 1183), the eminent punchcutter and type-founder, exhibited types and flourishes of first-rate merit, and music types with separate ledger-lines running the whole length of the line, in brass or other metal, a great improvement on the ordinary music other metal, a great improvement on the orthogy music types—M. Garthitizk's neath-ort and cast letters (234, p. 1187) deserve mention—MM. Lamonaxie and Co. (855, p. 1233), successors to Didot, have shown great skill in their printing types. M. Rocsosza (361, p. 1194) exhibits music composed with moreable types and matrices, in which there appears to be no marked novelty.

maintain the reputation of their old establishment for

good printing types and stereotype plates.

Germany. Besides the Exhibitory whose merits have already been noticed, M. Denselen, of Frankfort (5 Zolly... (24, p. 1122), exhibited types said to be of new metallic composition; M. Schelter, of Dresden (3 Zollv., 182, p. 1113), a variety of printing types; and M. HAENEL specimens of types, hrass types for bookbinders, electrotype matrices for casting large types, and electrotypes from woodeuts, all possessing merit.

Type-founding in the United States.

Before the separation of the American colonies from the mother-country, paper, printing-presses, and types were almost all imported from England. Caristopher Sower, who established a printing-office at Germantown, near Philadelphia, in 1735, was the first who cast his own types. In 1768, Mr. Mitchelsou attempted to set up a foundry in Boston, and the same year Mr. Buel another in Connecticut, but neither of them were successful, Soon after the close of the American War, however, Mr. John Baine, of Edinburgh, established a type-foundry at Philadelphia, and he was, it is believed, the first who rannacipins, and he was, it is believed, the first who regularly carried on the business of type-founding in the United States. But the importation of British type, and the small number of newspapers, still constituted difficulties in the way of success. Baine died in 1790, and his partner returned to Scotland. About this time Mr. Archibald Binny and Mr. James Ronaldson established another foundry at Philisdelphia, unconnected with any other husiness, and were eminently successful. In England, at this time, the assortments of type in the foundries were about twenty in number, of which the largest was the twelve-line pica, and the smallest the diamond, of 202 lines to a foot. The assortments of Means, Binny and Ronaldson at first embraced only the more essential fuunts, such as brevier, bourgeois, primer, small pics, pics, and two-line letters. At this period the increase of printing in the United States was most extraordinary. The number of newspapers in ten years from 1790 increased from 70 to 200, and the number of offices for miscellaneous printing exceeded 50. The printing business in these ten years increased probably threefold. There was, of course, a corresponding increase in the business of type-founding; and before long Mears. Binny and Ronaldson's assortment became as extensive as in the chief foundries of England. It is to them the world is indebted for the first real improvement in typefounding since the days of Peter Schoeffer, This imortant improvement was in the type-mould, by means of which a caster could cast 6,000 types in a day as easily as he could have accomplished 4,000 by the old process.

About the beginning of the present century the in-vention was introduced into Europe, and is now generally known as the American Mould. Measur. Binny and Romaldson's type was considered good at that time; with it Dobson printed the first American edition of the Excy-CLOP EDIA. in 21 large 4to, volumes, 1798-1863. About the year 1805, another type foundry was set up in Baltithe year 1800, amount type nomary was bet up to hand-more, by Samuel Sower and Co., which contained some of the months and matrices used by Christopher Sower mentioned above, who east his own type in German-town in 1740. They were chiefly for German letters. To these were now added a variety of excellent Roman and Italie types, and among others the diamond with a smaller face than had ever before been cast either in Europe or America. Nearly about the year 1805, Mesers.
White and Wing established a foundry at Hartford, in
Connectiont, where they devised and used a plan of their own for casting twenty or thirty letters at a time, and are said to have brought their invention to a useful slegree of perfection. On Mr. White's removal to New York, in 1811, when he established the first regular and extensive foundry in that eity, this invention seems to have been shandoned, and the old plan of casting by

Russia,—M. RÉVILLION (361, p. 1383) has abown good speciments of Greek, Oriental, and other types, Sardinia,—The Jury have remarked MM, Parina'a (47, p. 1304) small punches and types, Hidland—MM, Execut one and 6 (79, p. 1146)

^{*} M. Beyerhaus has made a smaller type, which is also very well executed.

single letters was pursued, as it is to this day. Thus see that in 1811 there were four foundries in the ited States. During the proceeding ten years the news-United States. papers increased from 200 to 360, of which 27 were daily papers. It is estimated there were at least 500 printing-offices in the country; indeed so great was the demand for type in 1811, that it advanced in price 25 per cent. on what it cost in 1806. In 1813, Messes, D. and G. Bruce established another foundry in New York, which soon became a stereotype foundry, of which we shall speak in another place. In 1818, and within a very few years after, type and stere-type foundries were set up in Boston, Cinciunati, Buffalo, St. Louis, Louisville, &c. The business soon became over-lone, and the price of type receded to the old standard of 1806, and caused many

In 1828, Mr. William M. Johnson took out a patent for the invention of a machine for casting type, by which he was enabled to give a sharper outline and better face to the letter by using a pump to force the liquid metal into the mould. This idea subsequently underwent many modifications and improvements by different individuals. Several patents for improvements in the machinery for easting printing types have been issued within the last ten years, so that at present all obstacles to this mode of producing types seem to have been surmounted, and this practice is now in general use-in large establishments ehiefly hy the aid of steam. By these improvements three times the quantity of type is produced by a caster in a day that was cast by Binny and Ronaldson's improved of them from the last mould, and five times the quantity that was produced by of the principal sorts.

the hand-mould half a century ago. On the first of June 1850, there were 2,800 newspapers in the United States. with an average circulation of 1,785 copies, giving the enormous aggregate of 422,500,000 copies printed anumally, There were 350 daily and 2,000 weekly pewspapers, The whole number of printing-offices is now not less than 4,000. Hence the demand for printing types is constantly and rapidly increasing. There has been a corresponding increase in type and stereotype foundries. There are now four foundries in Boston, seven in New York, three in Philadelphia, one in Boffalo, one in Albany, two in Connecticut, one in Baltimore, and one in St. Louis. These twenty establishments give employment to about 800 persons, and produce daily 4,400 pounds of type. By the recent improvements in machinery, type is at resent produced at a cheaper rate by 25 per cent. than . These twenty foundries supply not only the in 1841. in 1841. I nest twenty toundries supply not only the United States, and a great part of Canada, but export largely to the British, Spanish, and Danish West India Islands, Mexico, and South America. The exports of Islands, Mexico, and South America. The exports of printing-presses and types for the year ending June 1831, amounted to 71,601 dollars. The quality of the American type will, it is said, bear a favourable comparison with that of Europe, and it is cheaper. The metal used is a mixture of lead, antimony, and tin, in proportion to the kind of type required. The average of teal is 73 per

A statement of the prices of types for the last halfeentury may be interesting, we therefore give a table of them from the last Official Report, naming only some

The application of electrotyping to the formation of the durability of the types.* We are indebted to Mr. matrices is another improvement deserving mention, in:

Evaluat's Official Patent Office Reports for 1851 for most assumed as it saves much also the and tends to the reduction of of price. The process is probably the same as that employed in England and France, but in America it is much more extensively used, in consequence of uo law of registration being in existence there as in the former countries. It is found that the Patent and the Copyright Acts do not reach this case, as there is no date-murk on the type to identify it. The consequence is, that the moment any new or improved letter or ornament is produced either in Europe or even in the United States, it is at once electrotyped and reproduced by all the other founders. This seems unjust, although it tends to render

tounders. It is seems unjust, attended it details of cludes the types more naiform throughout the country. A patent has very recently been granted—10th Decem-ber 1850—to Mr. George Mathiot, for an ingenious device her 1830—10 Mr. George Mathiot, for an ingenious device for preventing the electrotype oast from adhering to the original plate. Many ways have been tried to obviste this difficulty, but the present is considered to be a decided improvement opon them. On the 20th of August 1850, a patent was granted to Mr. Luke Vander Van Newton for a new process of plating or conting the surface of metallic printing types, stereotype plates, and other printing plates, whether cast or engraved, with an additional cost of metal by means of galvanie electricity, This process of coating types with copper is asserted to be of great practical utility, and is said to add much to

of the facts stated.

Among the American exhibitors of types were Messra,
Honasr and Romss, of Boston (209, p. 1462); and Mr.

T. Toarr, of New York (304, p. 1462); the latter
exhibited combinations or logotypes, which he states
are unequalited for rapid composition, although it is well
known that in the "Times" wewspaper office they were disused many years since, as prescuting no advantages over separate or single types. Lord Stanhope also tried logotypes without greater success.

Stereotyping

is one of the means for making fac-similes in type-metal of pages of types, woodcots, &e., for surface printing.
At the commescement of printing, the idea of stereotype
must have occurred from seeing the reproductions in
relief of legends upon bells cast in the middle ages; it is resure or regentle upon term cast as the misdle ages; it is probable, however, that many attempts failed from the imperfect means used. As early as 1735, all the pages of Bibles in German and French, set up in movemble types, were kept standing by many printers. In the last century Samuel Luchtmans obtained plates by a process of clickage,

* Messrs. Orchard, Willis, and Co. of London, are the patentees for the United Kingdom, and for France, Belgium, and Holland.

from which he was enabled to print. About 1700, Valleyre printed in Paris some aimannes and pamphlets which he had obtained by casting. In 1725, Mr. William Ged, a goldsmith in Edinburgh, produced some stereotype plates from which he printed, in 1739, an edition of Sullint, but his process was little encouraged, and it was abandoned after his death, although those that opposed his method did not scruple to use his plates. In 1729, Mr. Ged entered into partnership with Messrs. James and Fenner, of London, for the purpose of carrying un the stereotype business. In 1782, Mr. Tilloch joined Messrs. Foults, of Edinburgh, for the same purpose. In 1784, M. Hoffman, of Alsace, France, succeeded in obtaining stereotype plates from monlds of clay mixed with gelatine. He printed a work entitled "Recherches His-toriques nor les Moures, par Chenter," in 3 vols. 8vo.; but the process was found imperfect, and was soon after-wards abandoned. In 1791, M. Cares, of Toul, a printer, warus ausanoneed. In 1791, M. Carex, of Toul, a printer, cunceived the plan of attaching to a heavy piece of wood suspended from a beam, a poge of moveable types, well-locked with servers, in a proper frame, with the face downwards, and letting it fall sharply on lead in a state of fusion, just when on the point of setting; he thus obtained not matrices, which were much as the contraction of the point of setting; he thus obtained good matrices, which were used to make relief stereotypes by attaching these matrices to the piece of wood as already described, and letting it fall on fasible metal when also just on the point of setting. Good plates were obtained; but it often happened that the types were melted when the lead was too hot, or bruised when too cold. This mode of stereotyping was therefore abandoned, and yet the plan of polytyping, carried on to this day, is not very dissimilar, although the use of more perfect machinery and different metal has much simplified the process, and readered it less destructive to the types

Profiting by these various attempts, M. Firmin Didot conceived the idea of easting types in very hard metal, composed of 30 parts of lend, 30 of antimony, 30 of tin, and 10 of copper. He gave to these types less beight that their solidity might be increased; then, by means of a fly-press, he pressed each page (composed of these hard types, strongly fastened together in an iron box) into a plate of pure lead. The plate or matrix of the page thus obtained was affixed to the under side of the banner of a stamping press, on the bed of which was placed in a paper case an alloy, still in a state of fusion, similar to that used for ordinary types, and at the moment when after having been rolled up into a pasty consistency in this paper case it was upon the point of setting, the matrix of the page attached to the stamping press descended upon the alloy, forming a page in relief, the clearness of which was perfect, as may be seen from the collection known by the name of the stereotype edition, composed of more than 200 volumes. At the same time that Firmin Didot succeeded by this process, M. Herhan, who at first had been bis partner, resorted to another method, which consisted in striking in copper a great number of matrices arranged in such a manuer as to admit of the pages being set up with these matrices as if they had been types, with this exception, however, that instead of being in relief, like the letters, the matrices were sunk. The page when composed was attached to the hammer of a stamping press and allowed to fall npon an alloy still in a state of fusion, and thus a whole page in relief was obtained by means of these hollow matrices. This expensive process was attended with more inconveniences than that of Firmin Didot. Both of them were superseded by the process invented by Lord Stanbope in 1800, who, resuming the first attempts at stereotyping, moulded in plaster or in alabaster, the pages composed with ordinary types, and obtained easts in relief by drying the moulds in a proper manner, and plunging them into a vessel filled with metal in a state of fusion.

Numerous attempts have since been made to substitute for plaster moulds the employment of sheets of paper with whiting placed between them, but the results appear inferior to the plaster moulds,

For vignettes, easts of bitumen answer very well, and stereotype plates of bitumen give good results. Annuag the products which particularly deserve to be

Sec., and plairs for printing in various colours; and also of Messrs, Manchin and Money, of London (128, p. 545), for their successful application of bitumen to the purpose of stereotype. This process, although new in England, seems to have been used in other countries for some time, and in the "Hlustration," by Mr. Plox, who Basker's specimes of casts (189, p. 550) from wood matrices are produced by a most ingenious process, of foreign invention. They are used extensively by calico-printers in Manchester and other places. The mode of obtaining these casts is as follows: a pattern of the size required is put on wood in the manner well known to pin and coppered pattern makers, care being taken that, in driving the pieces of copper in the wood block, they are furced to equal depth. Tin in a melted state is then poured on this pin or coppered pattern to the thickness of half an ineb, and when cold the pattern block is placed on the bed of a screw-press, constructed for the purpose, and beld fast by means of screws, whilst the part on which the tin has been poured, is affixed by clamps to the screw of the press, and by it drawn out from the pattern-block, the tin bolding in a solid mass the copper forming the pattern, and leaving the wood as a matrix, from which a number of plates can be obtained by casting with fusible metal. The easts exhibited by Mr. Bankes are very beautiful and perfect, and of greater depth than can be presutint and perfect, and of greater depth than can be obtained by any other known process. Mr. Mrita, of Glasgow (174, p. 546), had an electrotype from a page of diamond type, which appeared good. Mr. Crouston, of Paris (133, p. 1177), had some specimens of stereotype from paper mondis, which scens to be the same system as that patented by Mr. Kronhein some years ago, and which did not prover practicable. Mr. Evansa, of Philadelphia (88, p. 1438), also exhibited stereotypes and electrotypes of some merit. Printing Ink. The ink of the earliest printed works of the fifteenth

INSPECTION (780, pp. 1093, 1094), whose specimen of stereotype in cast iron, with the Hible printed from it,

shows a new application of that metal; of KNIGHT and HAWKES (107, p. 544), who exhibit good

atnry presents to our view every desirable quality. It is black, glossy, and the lapse of four centuries has demoustrated the fact that it has retained its primitive qualities up to the present day. It is not the same with later impressions, in the greater part of which the ink is more or less decomposed; nevertheless that which the Aldi, the Stephani, the Elzevirs, the Ibarras, the Bosonis, the Plantins, and all other printers who were scalous for typographical renowa, manufactured themselves, has retained all its primitive quality. At present the manufac-ture of ink is in many respects good, and the grinding, which cannot be too complete, has become more perfect by the application of improved machinery; but the ink is too often deteriorated by adulteration

It is especially to Mr. De La Rue that this manufacture owes some real improvements, as may be judged from his owes some real improvements, as may be judged from his specimens of printing in different colorars, both upon card and upon paper. The brightness of his colours is as remarkable as their variety, and his inks are capable of being glazed almost immediately after printing. The brightness of the printing in gold, executed by his process-tory of the printing in gold, are caused by his processat his manufactory, is very superior to others. At the same time it is doubtful whether the brightness of ver-milion ink is equal to the intensity of the red used in the printing of the fifteenth and sixteenth centuries.

As to the printing inks sent to the Exhibition, time is the only test capable of deciding their respective qualities and as, moreover, an lak suitable to one climate may not suit another, and lastly, as the ink must be differently modified according to the state of the atmosphere, always so variable, the Jury, on weighing these considerations, have deemed it their duty to refrain from giving any opinion upon this class of products, fraring that their indements might be set aside by time, which alone is able mentioned, are those of the RUBELAND DUCAL FOUNDRY to disclose the truth.

Composition Printing Rollers

At the commercement of 1819, M. Ganal, of Paris, who had been for a long time occupied in the manufacture of month glue, which consists of a mixture of sugar and glue, and Mr. A. Chegaray, overseer in Mr. Smith's printing establishment in Paris, made printers' rollers of this composition. They are stated to be more durable

than those made of treacle and gine.

In 1813, when Messrs Applegath and Cowper's print-

ing-machines came in more general use, the patent inking-tables and composition rollers were introduced to the hand-printers; but the prejudices of the pressmen against their use were earried to such an extreme, that it appeared almost impossible to succeed in introducing them. Mr. Harrild, however, whose knowledge of the printing business rendered him equal to the task, persevered in coneilinting the pressmen, and demonstrating to them how greatly the adoption of this beneficial invention would be for their advantage, till after displaying the most untiring euergy, his efforts were at last erowaed with success; and he had thus the satisfaction of not only benefiting the men themselves, but of also rendering an essential service to the printing business. He was rewarded by the large demand ereated for rollers, every pressman becoming as enger to put aside the use of balls pressman necoming as eager to put assure the second as he had been to oppose that of composition rollers. The manufactory which he subsequently established, and the perfection of his inking rollers, poves his sound knowledge of what was required. Means, Harriki's manufactory is now on an immense scale, and supplies the greater part of the printers in England with inking-rollers, which possess every requisite quality. Mr. Cowper, who is the inventor of inking-tables and hand-Cowper, who is the inventor of manig-tubres and assur-orblers, has never benefited by this valuable acquisition to the printing basiness, a fact which cannot but be re-gretted. Messrs, Hamatin (157, p. 244) exhibited in the Machinery Department, Class VI., inking composition rollers and bulls, and were the only exhibitors of this kind of rollers M. Lendenmann (Switzerland, 232, p. 1281), of Grub,

M. Lendenmann (Switzerland, 232, p. 1281), of Grub, Canton of Appenzell, Switzerland, was the only other

9 It is stated, on the authority of Mr. Harriki, that the composition was discovered by a Mr. Edward Dyna, printer and parish-clerk, of Mudely, near Weilington, Shrapshire, from the simple circumstance of a glue-pot being used, and not having a pelt ball ready. Dyna took a piece of giue in not having a pelt ball ready. Dyna took a piece of giue in a soft state, and inked a form with it. It is further stated that he added treache afterwards to keep it soft. Mr. Harriki blinned firstordered camposition balls in 1810.

cabibitor of printers' rollers, which he called "Swiss imitation caoutchour." The Jury had no means of practically ascertaining the morit of these rollers, but it must be stated that the fissures on their surface left anything but a favourable impression.

Printing for the Blind,

The Jury have nucleof with pleasure the large number of relabilities, The Signian Meanue, the Allievenia, and offer challenges, The Signian Meanue, the Allievenia and structure of the binds. It has been estimated that in the structure of the binds. It has been estimated that in the case of the significant of the structure of the progress of our say. The invention of printing for the blind marks a new ern in the history of literature. The whole credit of this invention, so simple yet so marvellous in its results, be-longs to France. It was M. Valentine Hady who, in 1784, at Paris, produced the first book, printed with letters in relief, and soon after proved to the world that children might easily be taught to read with their flugers. It has been said by his biographer that he took his idea of emboased typography from seeing that Mademoisella Parodis, a blind planest of Vienna, who visited Paris that year, distinguished the keys of her instrument by the sense of touch, and also readily comprehended the nunps in relief which a short time before had been invented by M. Weisembourg of Mannheim. After employing letters of different forms and sizes, and experimenting with the blind as to the precise shape of the letter that could be the most readily distinguished by the touch, he at length fixed upon a character differing very slightly from the ordinary Roman letter, or perhaps a little approaching italies. There was the usual mixture of the upper and lower case, the capitals taking more of the script form than the small letters. He submitted his first efforts and experiments to the Academy of Sciences of Paris. A committee was appointed to examine them, consisting of the Due de la Rochefoneauld, M. Desmarets, M. Demours, and M. Vicq-d'Azir, and their favourable Report on the 18th of February, 1785, rendered his success a triumph. Great clar attended the public announcement of this invention. A new Institution was established, called the Institution Royale des Jennes Avengles, and M. Hany was placed at the head of it. Among the books which be embossed were a grammar, a catechism, and small portions of the Church service, and also several pieces of music. The printing of the music was inferior. The abbreviations which he introduced into his grammar, it has been said, did not afford sufficient advantages to counterbalance their inconvenience. His principal work, is entitled. Espesé de différents moyens vérifics par l'ex-périeuce pour les mettre en ciat de lire à l'aide du tact, d'imprimer des livres dans lesquels ils puissent preude de consaissances de langues, d'histoire, de géographie, de munique, etc.; d'exécuter différends travaux relatifs aux Imprime par les Entants Avengles. Paris, 1786, 4to. This celebrated essay was translated into Euglish by Dr. Blacklock, the blind poet, and in 1793 was published in London with his poems, in quarto. On the 26th of December 1786, twenty-four of M. Hany's pupils exhibited their attainments in reading, writing, arithmetic, music, and geography, before the King and the royal family, at Versailles, who were delighted with the wonderful results. For a while all went on prosperously, but M. Hafty's friends soon began to give him eredit for zeal rather than discretion in the management of his Institu-

tion, and consequently as the novelty were away their

admiration cooled, the funds fell off, and the Institution languished until it was put upon a government foundation. The blind really received but little advantage from an invention that at first promised so much. The fault, however, seems to have been not so much in the plan as in the execution of it. The books were bulky and expensive, and the letters, though beautiful to the eye, and elearly embossed, wanted that sharpness and permanence so essential to perfect tangibility; besides that, though the letters filled three spaces, they were too small to be well adapted to the sense of touch. Large editions of the few books printed were published, the idea having taken a strong hold of the public mind, so that though the evil was soon perceived, it was not easy to abandon the defective alphabet and assume a better, for that step involved the sacrifice of all the previous labour. Hence this noble lavention, except, perhaps within the walls of the Institution, seen sank into oblivion, and very fittle more was heard of it until 1814, when Ilaüy, having fallen into disrepute, was pensioned off on 2,000 francs a year, and Dr. Guillié, an active and enterprising gentleman, was made Directour-Gradeal in his place. Dr. Guitlie soon revived the printing, and having considerably modified the letters, commenced the publication of a series of elementary and other works, among which are the following (see Table No. L, p. 415).

The mechanical execution of these volumes was ex-ecedingly heavy. Most of them were ponderous folios and very expensive, still they formed for many years almost the only literature of the blind, not alone in France, but in other countries. We should not omit pur-France, but in other countries. We should not omit par-ticularly to mention the following book which has come under ont notice:—Notice Historique sur l'Instruction des Jesnes Avengles. Par M. Guillié, Directeur-Général de l'Institution Royale des Jeunes Acesoles de Paris. Paris, Imprimé par les Jennes Avengles, 1819, 4to, 52 pages, with 17 lines to a page. Two leaves are pasted together, so that it is read as if embossed on both sides of a sheet. This is the second edition, the first having been embossed in 1817, the third in 1820, and a fourth edition enlarged in 1821 On page 52 is a enrison specimen of printing in relief, in colour, so as to render the letters more easily read by the ove. This book was a valuable contribution to the library of the blind, hat still retains nearly all the objections that were made to Hauv's first books; it can only be read by those possessing a very delicate touch It is replete with information respecting the means then employed for the instruction of the blind in Paris; it roves, however, that the art of embossed typography and made but very little progress. It is singular that in this book no mention is made of the author's predecessor, Hany, to whom, we should not forget, the idea of fingerreading is due. Between the years 1821 and 1840 very little printing

was done by this Institution, except religious books, and music after the system of notation by letters and ciphers The annexed is a list of them see Table Nn. IL, p. 415). L'Institut des Jeunes Avengles de Paris, since its fonn dation in 1784, has at times been in a deplorable coudition, but about the year 1840 it underwent a thorough reorganization, and is now, under the nile management of M. Dufau, justly entitled to the front rank of iostitutions of this class in Europe, from its unclusees no less than its age. A rudieal reform in the printing depart-ment has been made: M. Dufan has devised a system of types consisting of capitals and lower-case Roman letters, and has greatly improved the character of the embossing. The French books are now well embossed, sharp, clear, and durable. They have also been so much reduced in bulk that they are offered at a moderate price. M. Dufan has proposed to print a standard library for the blind, to consist of 10 vols., in quarto, for elementary instruction, and 10 vols. for higher instruction. The first series is nearly completed, and this is the list (see Table No. III., p. 415).

p. 415). The accord series of this library, not yet printed, it is to be hoped will soon follow. For the above lists, and other interesting information respecting the Paris typo-graphy for the blind, the Jary is much indebted to a valuable pamplet published by M. J. Gandet, entitled

L'Institut des Jeunes Avengles de Paris, son Histoire et ses Procedes d'Enseignement, Paris, 1830, 8vo, pp. 115.
At Vienna an institution for the blind was established

in 1804, but the Jury is not aware of any printing having been executed in Austria before the year 1830 or 1831. About this date the intelligent publishers Trensinsky, of Vienna, embossed sheets with the Lord's Prayer in various languages, in Roman letters, and afterwards printed works for elementary instruction. The subject has been recently taken up by the Imperial Printing-office, and several volumes have been published, but the Jury are unable to give a bibliographical description of them

In 1806, M. Hauy was juvited to establish institutions for the blind at Berlin and St. Petersburgh. His system of instruction was adopted in each of these institutions and the books used were for a considerable time supplied from the press of Paris. Both of these institutions in a pecuniary point of view were unsuccessful to M. Hauv, and in 1808 he returned to Paris, and for a while resided in quiet with his brother the celebrated Abbe Hally

he Jury have not been able to trace the progress of the printing for the blind at Berlin or St. Petersburgh, but they learn that the amount of matter embossed in Germany until vary recently did not exceed half of the

New Testament. It was in Great Britain and in the United States that

the first improvements were made in embossed typo; generally have derived any considerable advantages from books. Before 1825 when M burgh, first began to turn his attention to the intellectual and moral education of the blind, it is believed that not a single blind person in any public institution of this country or America could rend by means of embossed charac-To Mr. Gall is due the credit of reviving this art. With the most commendable seal, patience, and perseverance, he canvassed the form of every letter until at length be adopted his angular alphabet. He seems, from length he adopted his anguinr aipmaces. He seems, his own Historical Sketch of the Origin and Progress of the Literature of the Blind, Edinburgh, 1834, 8vo. pp. 388, to have experimented long and patiently with a great variety of eristrary and Homan alphabets, with a view of finding one sufficiently simple and tangible for finger reading. On the 28th of September 1827, he published "A First Book for teaching the Art of Reading to the Blind; with a short statement of the principles of the art of printing as here applied to the sense of touch. Edin-burgh, published by James Gall." This is believed to be the first book printed for the blind in the Eaglish lan-guage. It is a small oblong octave volume, of uine pages, price sixpence, with four preliminary leaves in which the author sets forth his "principles." The embossing is in high relief, and though it presents rather a rude appearance from the fact of its having been printed from wooden types, yet it soon rendered the practicability of rending by the blind a matter of experience in Great Britain. Mr. Gall then issued sheets printed by metallie type, which were easily rend by the pupils in the asylum type, which were easily read by the pupils in the system at Edinburgh. Encouraged by his success, in March 1828, he issued his prospectus for the publication, by subscription, of the Coople by St. Johs, but it was not until about the middle of 1829 that he perfected his alphablet to his own austifaction. He tried three different founts of type:-first, the double english size; second, the founds of type:—Inst, the double engins size; second, the double pion; and third, the great prince; and, after printing and cancelling shoets in each of these three founts, be at length, in January 1832, finished the print-ing of his great work. The blind must ever feel indelsted to Mr. Gall for the zed and honest endeavour which he displayed in accomplishing what he thought would most benefit this unfortunate class. Notwithstanding the last sheet of his work was printed in January 1832, yet it was not till October 1834 that he was enabled to publish it, It is entitled, "The Gospel by St. John, for the Blind: with an Introduction, containing some Historical Notices regarding the Origin of a tangible Literature for their Use. By James Gall, Edinburgh: James Gall, 24 Niddry-street, 1834. In 4to." The Introduction, in common type, comprises 18 pages. The text, in emboused characters, consists of 141 pages, with 27 lines on a page

These four bistories were composed by M. Guadet upon a new plan, and are pseuliarly adapted to the use of beginners.

of 70 square inches. The leaves are not pasted together. The subscription price of the volume was one guinea, but it was subsequently sold for 6s. Gall was very sanguine of the entire success of his noble enterprise, and, proba-hly, had be chosen a less angular character, and one a little more resembling our common alphabet, as he has since done, he would soon have seen his books used in every institution in the conotry. His alphabet was the ebief objection raised to his system. His printing was clear, sharp, and permanent, and his books in every Guillie's. He published five or six other little elemen-tary books in 1834, at the time he issued his chief work; but his system seems not to have come into extensive use. It is to Mr. Gall, perhaps, more than to my other man that the interest in the education of the blind was nwakened thronghout Great Britain and America. Nor has he allowed his exertions to flag. In 1837, he published "The Epistle of Paul the Apostle to the Ephe-sians, printed for the Blind, on the largest type." The shape of the characters is similar to that upon which the Gospel of St. John was printed, but instead of being smooth the letters are fretted or serrated. It is a small octavo volume of 72 pages, 17 lines to a page; 230 copies were printed at the price of 1s. 6d. It is prioted in the lower-case letters without capitals. The Epistle to the Philippians was also printed, in octave, price 1s. 6d. The following year he again modified and improved his alphabet by hringing it back to a still greater resem-blance to the common alphabet, but unfortunately he yielded to the suggestion of the Society of Arts of Edinburgh by introducing the use of capital letters at the beginning of sections and proper names. His next book was "The Goopel according to St. Lake, printed on the common alphabet, for the use of the Dilad, and capable the British and Fereign Bilde Society, London. Printed by James Gall, 22 Niddry-street, Edinburgh." This is a well-printed volume of 15a pages, 25 those on a page of the Apostles were printed in the same sevrated letter in 15p pages, price 5a. Besides these books Mr. Gall printed a series of trusts for the billed for the London surprise that these excellent and well-printed books of beginning of sentences and proper names. His next book surprise that these excellent and well-printed books of Mr. Gall are not more generally used. With the excep-Mr. Gall are not more generally used. With the excep-tion of the school at Abbey Hill, near Edinburgh, it is believed they are adopted by no public Institution in Great Britain. It is still a question if the roughness of Great Initials. It is situs a question if the ronginess of the servated character possesses any advantage over the smooth, sharp embossing. Old and used books are frequently preferred by the hind to new and fresh ones. While Mr. Gall wast thus engaged at Edinburgh, the Rev. Mr. Taylor, of York, displayed an intelligent and active interest in the education of the blind. In 1828, he published the Diagrams of Euclid's Elements of Geometry in embossed or tangible form, in 8vo. This was done on Bristol board, but was found too expensive. His mode of embossing, we believe, was forcing the paper, by means of beavy pressure, into the deep cut lines of a copper plate. It was not successful. He published also a map of England and Wales. In 1836, he printed in raised characters "Selections of Pealm Tanes and Chants" in of Janginian and Waises, In 1888, no printed in range characters, "Selections of Pealm Tranes and Chantat" in characters, "Selections of Pealm Tranes and Chantat" in and of Nanman the Syrina; and the History of Joseph, The efforts of Mr. Alexander Hay, in the canse of em-bossed typography, deserve mention, although an entire fulture. He devised an alphabet of 32 entiritary charac-ters, which by certain combinations could represent the abbreviations and devable electres; so that in all, he had 38 anorevination find reduces exteres; so train in air, are not one characters. He procured types and other printing appa-ratus, and in 1826 or 1825, issued a prospection for pub-lishing the Gospet of St. Matthew, at 7s. 6d. The book was never published. The public interest in the hind became so great, that

was never panissed. The public interest in the hind became so great, that in 1832 the Society of Arts of Edinburgh offered a gold medal of the value of 26t, "for the best communication on a method of printing for the blind," and the result was that between the 9th of January 1832, and the 25th of February 1835, no less than 19 different alphabets

were submitted, of which 16 were in a purely arbitrary character. The grand problem was to produce an alphabet that would unite cheapness and legibility.

While the puzzling question of an alphabet best adapted both to the fingers of the blind and the eyes of their friends, was under warm discussion on this side the Atlantic, Dr. Howe was developing his system at Boston, in the United States. In 1833, the Perkins Institution for the Blind was established at Boston, and Dr S.G. Howe, n gentleman distinguished through a long series of years for his philanthropic labours, was placed at its head. As Gall had done, Dr. Howe took Haily's invention as the basis of his system, and soon made those improvements and modifications which have rendered the Bostou press so famous. He adopted the common Roman letter of the His first aim was to compress the letter into lower case. His first aim was to compress the setter into a comparatively compact and cheap form. This he accomplished by enting off all the flourishes and points about the letters, and reducing them to the minimum size and elevation which could be distinguished by the generality of the blind. He so managed the letters that they occupied hat a little more than one space and a half instead of three. A few of the circular letters were modiinstead of three. A few of the circular letters were modified into angular shapes, yet preserving the original forms sufficiently to be easily read by all. No great was this reduction, that the eatire New Testament, which, according to Hañy's type would have filled nine volumes, and cost 20%, could be printed in two volumes for 16s. Early in the summer of 1834 be published the Aets of the Apostss. Indeed, such rapid progress did he make in his enterprise, that hy the end of 1835 be printed in relief, the whole of the New Testament for the first time in any language, in four handsome small quarto volumes, comprising 624 pages, for four dollars. These were published altogether in 1836. The alphabet thus contrived by Dr. Howe in 1833, it appears, has never since been changed. It was immediately adopted, and subsequently became extensively and almost exclusively used by the seven principal public institutions throughout the coun-try. It is now the only system tanget or tolerated in the try. It is now the only system range.

United States, and deserves only to be better known in
Grent Britain and elsewhere to be appreciated. In Ameeducation of their blind, and as universal education is the policy of the country as well as its proudest boast, these books for the blind soon became in great demand. Dr. Howe some time since proposed a library for the blind, and with a view of increasing the number of books as rapidly as possible, arrangements have been made between the several institutions and presses to exchange books with each other, and not to print any work already belonging to the library of the blind. This barmony of action, together with the uniformity of the typography, presents su many obvious advantages, that the Jury ca not but wish a similar system were pursued by the Insti-tutions of Great Britain and the continent of Europe. We subjoin a list of the books printed at the press of the Perkins Institution in Boston (see Tables p. 417). From this list it appears that, exclusive of the three volumes not fully described, 7,903 pages, containing on an average 77 square inches, have been printed at this press, or more than 12 times the quantity of matter contsined in the New Testament. Almost all the books are toined in the New Testament. Almost all the books are sterostyped, and small editions are struck off as they are required. They are sold at the actual cost, the cost of the larger works being averaged on an edition of 250 copies. The above prices include the bludding; 50 per cent. discount is made for books sold in sheets. The books are embossed in the Institution under the superin-

tendence of Dr. Howe himself, by means of a powerful press, huilt for the purpose. The sale of books in 1851 amounted to 427 dollars. This, however, is exclusive of

the Scriptures. The American Bible Society, which now uses the stereotype plates of the Bible described above, distributed last year 149 volumes of the Bible. In short,

the Boston books possess a neatness, clearness, sharpness, and durability of impression peculiar to themselves. The seventh volume of the Cyclopedia is already printed, and the Jury learn with pleasure that the printing of the remaining volumes will be resumed and probably be

finished in 20 volumes very soon. Want of funds is the

temporary and only obstacle.

About the time that the Perkins Institution was established at Boston, another was set up in Philadelphia. A meeting of benevolent persons was called on the 21st of January 1833, when arrangements were made to open a January 1853, when strangements were innet to open a school for the instruction of the blind, and Mr. J. R. Friedlander was placed at its beed. This school became the Philadelphia Institution for the Hild by Act of In-corporation, 27th of January 1854. The hind owe much to Mr. Friedlander for the Philadelphia contributions to their literature. On the 21st of November 1833, he held his first public examination, and astonished the public by the progress of his pupils in reading, writing, geography, music, &c. The pupils read fluently from tangible letters executed by themselves with pin-types. These were small pieces of wood about two inches long, having a letter cut in relief on one end, and the same letter formed ut the other by steel points. Maps of the world and of the United States were also exhibited, made by perforat-ing the outline from behind. The result of this exhihiston was highly satisfactory. In his address, Mr. Friedlander set forth the greut advantages that would accure to the hilid by a general system of instruction. He repeated the usual unanswerable arguments against the advantage of other systems of the property of the satisfactors. the adoption of arbitrary characters, and stenographic or phonetic systems, and strongly recommended the use of our own alphabet. He followed generally Hauy's plan of instruction. Early in 1833, Jacob Snider, a young gen-tleman, native of Philadelphia, applied his mind to the contrivance of a method of printing in relief. The alpha-

sure on thick paper between two sheets of copper having the letters deeply cut. The embossing was thus on both sides. His first attempt, after printing n few elementary sheets, was on the Gospel of St. Mark, which he completed by the end of 1833, in a large quarto volume, and published early in January 1834. An account of his first American book for the blind may be found in Poulson's American Daily Advertiser of the 10th of January 1834, The four Gospels were soon after printed in Roman capitals; but being found too bulky and otherwise objection-able they were abandoned, and a smaller, more compact, and sharper type, in the Roman capitals, was adopted. For the list of books printed at the Philadelphia press, see

Table, p. 418. It oppears that the Boston and Philadelphia Institutions were founded almost simultaneously, and that their presses and system of typography were established without being apprised of the efforts of each other. Time, however, has at length remedied this diversity. typography of the Philadelphia books is exceedingly well executed, and compares most favourably with the best of the Glargow books, but the press has censed to work, and printing in capital letters will not probably be resamed. From the preference which the present distin-guished and intelligent Director of the Philadelphia Institution, Mr. William Chapin, late Superintendent of the Ohio Institution, is known to entertain for the Boston system of typography we may reasonably hope that when printing shall be resumed there it will be with Howe's alphabet. It is the opinion, however, of Mr. Chapin that all the American Institutions should unite. bet at first adopted was a mixture of the upper and lower not only in the use of the same alphabet, but that they case italies, and the relief was produced by heavy pres- should all contribute to support one press. It may be

remarked here that the pupils in all the American Institutions read flucutly in both the upper and lower-case letters, but it is presumed that Philadelphis and Glasgow books will soon be entirely abandoned there; and as the Boston books can now be obtained in London at a price cheaper than any of the five different systems of books printed in Great Britain, it is to be hoped that they will come into general use here. If it be thought that the letters are too small for idults to read with ease, books may be printed with larger types, and even then be less bulky and expensive than any of the systems in arbitrary characters now in use.

In the year 1848 or 1849 the Virginia Institution set up a press, and has printed several elementary and school The Boston type is adopted, with the exception useas. The mostom type is mapping, with the exception that capitals are used at the beginning of sentences and proper names. This alteration, in the opinion of the Jury, is not an improvement, as the blind are thus comnelled to learn two alababets instead of one. The Virginia books are well embossed, and it is hoped that in future books capitals will be omitted.

To the American Bible Society at New York much asse is due for their commendable efforts in the circulation of the Scriptures among the blind. The stereotype plates of the Bible in six volumes, executed at the Boston press, under the superintendence of Dr. Howe, now belong to this Society. They have printed a second edition from the same plates, and annually distribute gratuitnessly from 100 to 300 volumes.

It had ceased to be a matter of surprise in the United States that the blind could read, before the public attention was loudly called to the subject in Great Britain, for we see that in 1836, there were two active printing establishments for the blind in the United States; by one the whole of the New Testament had been published in a cheap form, in the common lower-case letters, and by the other the four Gospels in Roman capitals. Let us now return to the Society of Arts of Edinburgh, and their Prize Medal, to which we have already referred. It was not until the 31st of May, 1837, that the Society's Medal was awarded. In 1836, when the 19 different nlphabets were before the Committee of the Society, circulars were drawn up and distributed, with specimens of the several alphabets, to the various institutions for the blind in England and Scotland, and every means emninin in Engano and Scotland, and every means em-ployed to arrive at a correct result. The opinions of Mr. Taylor, of York, and Mr. Alston, of Glasgow, seem to have been those which the society chiefly followed. They were in favour of the common homan capital letter, merely deprived of the seruphs, or small strokes at their extensities and exceedingly the second extremities, and accordingly the prize was awarded to Dr. Pry, of London; and on the 31st of May, 1837, a Medal was granted to him for the invention of an alphabet which appears to have been in use since 1833 in Philadelphia. On receiving the Society's circular in 1836, submitting

the forms of all the competing alphabets to him, Mr. Alston was struck with the simplicity of Fry's, and imme-

diately conceived the idea of making such alterations as he thought necessary, and patting it to the test. The changes made were simply to reduce the size of the letters and render the faces thinner. On the 26th of October 1836, he exhibited his first specimen of printing in relief in the Roman capital letter at a public examination of the hlind. It was Fry's alphabet slightly changed to improve the sharpness of the embossing. He then made a success-ful appeal for a printing fund. After great exertions and most commendable perseverance he procured a printingmost commendable perseverance be procured a printing-press, with two foatm of type, and the other necessity of control type, and the other necessity of elementary works. By March 1885, he issued a few elementary works. By March 1885, he issued to progress that the whole of the New Testament was printed to four super-royal 4to volumes. The type is great printer, and there are in the four volumes 623 leaves of 42 lines to a page. In December 1840, Mr. Alston com-pleted the printing of the Old Testament in 15 super-pleted the printing of the Old Testament in 15 superpleted the printing of the Old Testament in 13 super-royal quarter volumes, in double per type. Of alise of the volumes he printed alon, and of the vensiting str., 250 with 37 lines on a page. Mr. Alston was justly proved of his great work, the entire Bible, containing the Old and New Testaments, in 18 volumes. In his "Nateseast 50 May 18 miles of the Str. of the Str. of the Str. of the subset of the Str. of the Str. of the Str. of the Str. of subset of the August for the Blind, Glasgow, with a short Account of the Str. of the shown that the greater part of it had long before been printed in Boston. We allude to these facts merely because it seems a matter of much regret that Mr. Alston should have devoted so much enterprise and money in producing the Scriptures when he might have ascertained that they had already been printed, and could have been bought at less money than it would cost him to print them. The main difference between the Glasgow and the Boston alphabets is that one is in the upper and the other is in the lower case, which difference is certainly not of sufficient consequence to demand two editions. summent consequence to demand two editions. Had he expended the same energy and money in producing other valuable books, and exchanged them with the Boston and Philadelphia Institutions, as he was urged to do, the three Institutions would have been greatly benefited by the large outlay, and the hind of both countries would have had a great increase to their library. On the 18th of January 1838, the officers of the Philadelphia Institution wrote to Mr. Alston, informing him that they possessed a wrose to Mr. Auton, informing aim that they possessed a dopt the same character, it appears to our Board of Management that both Institutions would gain by an interchange of volumes." Mr. Alston at once acceded to this proposition, and immediately shipped 150 volumes, being 10 full sets of the New Testament, and 50 single copies of the Gospels, hesides multiplication tables and other works. subjoin a complete list of the books issued from the Glasgow press since its first establishment,

Since the death of Mr. Alston, on the 20th of August, Since the death of Mr. Alston, on the 20th of August, 1846, the Changwey press has almost ceased to work. A full of the control of the control of the control of the control of the Apostics. Since 1837 it has been almost the only press that has supplied England, Ireland, and Scotland the choose in Emma type. There books are type-pressively well executed, and the Jury think that the Changwey and the Changwey are described by the Changwey and the Changwey are described of great Mr. Alston and the Changwey great are described of great and the Land of the Changwey are described of great and the Land of the Changwey are described of great and the Changwey are described of great and the Changwey are more described on the Changwey are described on the Changwey and the Changwey are described on the Changwey are de praise. The objections, however, to the small Roman capitals, in which most of the books are printed, are such that it is to be hoped that ere long this press will follow the example of that at Philadelphia, and adopt Howe's

typography.

It has generally been supposed that the Glasgow press
was the only one in Great Britain that printed anything
of consequence in the common letter. But we cannot omit to mention a valuable work that has come under our omit to incuttion a variance work that this course moser our notice; it is a "Magazine for the Blind. London: Simphia. Marsholl, & Co., Stationers' Court; Price 62; in treelee mostley parts. 1839-40." After two volumes were printed, the first Magazine for the Blind in this country advantaged by the form the Policy of the Blind in this country. praired, no rest Magazine zor no rimid in this country praired, no fall page. The type is the ceilinary mixture of the earliest praired for a full page. The type is the ceilinary mixture of the area of the ceilinary mixture of the beautiful prairiest of the ceilinary mixture of the beautiful prairiest prairiest produce the ceilinary distribution of the ceilinary d

a contribution to the literature of the blind should not have found better support. It consists of miscellaneous information, with fragments of authors, poetry, anecdotes,

woodents, &c. In 1806, an Institution for the Blind was established at In 18%, an instruction not the Billed was extensived as Stockholm, and it is with pleasure that we learn that Mr. Watts, of Crown Court, London, has, at the expense of the British and Foreign Bible Society, printed in relief, with the ordinary Roman type, in capitals and lower-case, the Gospel according to St. Luke, in Swedish, for this Institution. The volume was printed in 1848, and is a beautiful specimen of embossed typography. It is in quarto, consisting of 132 pages, 27 lines on a page of 70 square inches. Price, as sold by the Bible Society, at

cost, 6a; 500 copies were printed.

In France, Belgium, Prussin, Anstria, Switzerland, Sweden, and the United States, the Roman lower-cane alphabet is used. In most, if not all, of these countries, the Institutions for the Blind are supported and partially controlled by Government, and perhaps this is the reason why, in all of them nearly, the same system of typography

2 E 2

uniformity of typography were adopted. This diversity of opinion is causing great injustice to them, and the Jury cannot but urge upon the parties concerned the speedy adoption of some one system throughout the country Our opinion is decidedly in favour of Howe's American typography, Perfection is not claimed for this system, but it seems to us that there are fewer objections to it than to any of the others, and it may be the more easily improved; but any one of the five principal systems now used in England is far better than so many. The present state of printing in the Roman character in Great Britain is, as we have seen already, that every press has beco stopped, while the books in arhitrary characters seem to be increasing and gaining public favour. The principal of these is one known as Lucas's. It was devised by T. M. Lucas, of Bristol, about the year 1835. It consists of arbitrary characters, and is said to be founded on Byron's system of stenography. It is simple, speedily learned, and easily read by the touch, and is generally acknowledged to be of all the arbitrary systems the best. The printing in this system hegan at Bristol, and the following are the works published there:-

 The Gospel according to St. John, edited by T. M. Lucas, inventor of the system for teaching the blind to read by embossed stenographic character; July, 1837; Bristol; in 4to, 66 pages, and 27 lines to

July, 1837; Bristol; in 4to, 66 pages, and 27 lines to a page. Two pages are pasted together. 2. The Acts of the Apostles (according to the authorized version's, in T. M. Lucas's emboased stenographic character; 1838. Published under the direction of the Bristol Society for Embossing and Circulating the Authorized Version of the Bible for the use of the Blind; Bristol; in 4to, 118 pages, 27 lines on a page.

lines on a page.

This second publication of Mr. Lucas was announced as containing some improvements,—as widening the spaces, and lessemog the abbreviations.

3. The Gospel according to St. Matthew (according to the authorized version), in T. M. Locus's embossed stecographic character, 1839; published, &c. Bristol; 4to, 116 pages. In this third publication is announced the firm conviction that this system will prevail over any other plan, on account of its tangibility.

4. The Gospel according to St. Mark, &c.; Bristol, 1840; 4to, 71 pages.

The above, with the exception of a few small elementary

The above, with the exception of a few small elementary works, are, we believe, all that appeared a Bristol. In the other content of the content of the content of the conlection of the content of the content of the conlection of the content of the transferred from Bristol to London; not in 1841, the coverty issued "The Epithe to the Boumans." Since then their press has not been like, as the following int will stitution in the Avones Road, Regorn's Park.

Condition Condition

In May 1838, the " Loudon and Blackheath Association for embossing the Scriptures in various languages, and for teaching the Blind to read on the Phonetie System, was established. Its object is to stereotype the Holy Scriptures in James Hartley Frere's phonetic characters.
Alout the year 1839, Mr. Frere devised a cheap plan for embossing or stereotyping. It consists simply of small wires, drawn with angles laid down upon tin plates. The wires are best, and cut by means of ingenious spindles to common printing, or common neubossing, but to form an form the characters, which are similar to those of Gurney's casy introduction to them. The following is a complete system of short hand. The wires are attached to the plate by heating it sufficiently to melt the conting of tin, into

which the wire sinks and is fast when cold. The common printing press is need in embossing. Mr. Frere's books are read from left to right, and bock, after the manuer of the ancient Greek boustrophedon writing. Mr. Frere's books are well embossed, and from his plates the books can be printed as they are wanted. The objections to phonetic alphanets are obvious. Mr. Frere, however, does not claim to supersede the common spelling, or the list of Mr. Frere's books,

Howe's books are not only much less in hulk than any of the others, but are also much chesper.

APPARATES AND BOOKS FOR THE BLIND.

England, -Mr. E. A. Hvones (20, p. 537), of Mount Row, Westminster Road, exhibited a machine for enabling persons born blind to write, in raised characters, without using types; a machine to write with a pen or pencil in skeleton Roman capitals; a machine to cast accounts and make general arithmetical calculations by tangible characters; a machine to copy and compose music on paper, &c. Mr. Wedgwood, of Lombard Street, exhibited an improved noctograph, useful to persons who have become blind, after having learnt to write.

THE SOCIETY FOR TEACHING THE BLIND TO READ (198, pp. 550, 551), Avenue Road, Regent's Park, exhibited mbossed books for the blind; ciphering boards for the blind; maps for the hlind; geometrical boards for the blind; npparates invented by Mr. W. Wood, for enabling the blind to emboss Lucas's characters, and thus to con municate with each other; a specimen of music hy Mr. Wood, for the blind, in raised characters; and chess-boards for the blind. The system adopted is Lucas's, which has already been fully described, and has the objection of being in arhitrary characters: this also applies to the machine. This is a well-established Institution, and great pains were taken during the whole of the Exhibition, by the master, Mr. Wood, to demonstrate the snecessful operation of the various plans he has adopted to educate hlind persons.

Mr. JANES GALL, Myrtle Bank, Edinburgh (171, p. 548), exhibited Gall's triangular alphabet for the blind, which, hy its similarity to the Ruman alphabet, is said to be easily read by eye and touch without previous instruc-tion. A volume, containing the Epistle to the Ephesians, printed with this alphabet, and Gall's apparatus for writing by and to the hind. The apparatus consists of a stuffed frame, on which paper is placed; of a cover with bars to guide the lines, which are written from the bottom

By a comparison of all these lists it will be found that | upwards; and of small stamps, with the letters formed of common plus, which are pricked through the paper and read on the opposite side.

THE EDINBURGH SCROOL FOR THE BLIND, Abbey His Edinburgh (170, p. 548), exhibited Dr. Foulis' tangible ink for the blind. This ink contains a large quantity of solid matter, which is deposited on the paper, so as to present a raised workers to tity of solid matter, which is deposited on the finger. Dr. Punlis' as to present a raised surface to the finger. Mr. Gall's as to present a riases surface to the larger. Dr. Funiti-manuscript manies notation for the hind. Mr. Gall's typhlograph for the blind. Mr. Gall's system of arith-metic for the hlind, accomplished by common pins stuck into a pin-cushion, and Mr. Gall's types for corre-spondence, by which hlind persons can correspond with one another, or jot down memoranda for private use, Dr. Foulis' tangible ink appears to present some advantages, and will probably become a useful adjunct to the merous means devised for the instruction of the hlind, and for enabling them to read and write. The letters on the specimens exhibited were sufficiently mised to be quite perceptible to the touch.

APPARATUS, &c., FOR THE BLIND-UNITED STATES. Mr. C. Stans, of New York (89, p. 1438), exhi-hited books for the blind. Twu Bibles, embossed with Dr. Howe's characters. Two leaves are pasted together, and a stoat strip of paper stuck between and around these leaves, so as to form a rim to prevent the characters from being flattened on shutting and opening the book. This plan has also the same advantage as if each leaf were printed on both sides. The types are rather small, but the whole work is one of meri

Dr. S. G. Howr, Boston (439, p. 1463), exhibited books for the blind: his system has been fully described, and to it the Jury give the preference above all others,

Mr. Dongs, Superintendent of the American Depart-ent, exhibited Xenophon and Virgil; characters on Dr. Fry's plan, known as the Glasgow type, all in Romae capitals. This is the system adopted at the Manchester School for the Blind. It has been in use for about 15 years.

adoption

THE INSTITUTE FOR THE BLIND, Stanton, Virginia, exhibited specimens of books and types for the blind. The characters are capitals and lower-case; the printing is sharp and good.

APPARATUS, &c., FOR THE BLIND-FRANCE, M. Marcellin Legrand, Paris (584, p. 1206), exhibited type-plates to print in relief for the blind. The characters are rather too small, and possess the disad-

vantage of having both capitals and small letters. APPARATUS, &c., FOR THE BLIND-AUSTRIA.

G. B. Manchest, of Lodi (139, p. 1014), exhibited a writing-machine for the blind, producing the characters in block or in relief. The letters are formed with pin points, and they are sufficiently tangible; but having capitals and small letters, this plan offers the disadvantage that two alphabets have to be learnt.

APPARATUS, &c., FOR THE BLIND-BAVARIA. MM. Fens and Eisenburg, Augsburg (2 Zolly. 54,

p. 1100), exhibited metal plates, with letters and characters in relief. The letters are too broad, and are not well adapted for the blind. The Jury beg to suggest that a uniform system should be adopted, and that, in foture, all books printed for the bliod should be printed in the same character. Dr.

flowe's plan appears simple, easy, and fit for general II. BOOKBINDING.

Splendonr in the binding of books is a taste which dates back from remote times. The rarity of maouscripts, and the ornaments of every kind with which they were enriched, rendered them so precious that they were exhibited upon desks for the purpose of gratifying the sight and the pride of their possessors. Seneca said of them: "Plerispee libri non stediorum instrumenta sunt, ad adum ornamenta." But if these rich bindings, some beautiful models of which still exist in public libraries, were suitable before or soon after the invention of printing, when books were almost as scarce as manuscripts. they are an anachronism, when we are compelled to heap them so closely in our libraries. These magnificated covers, executed for the greater part by jewellers, who cariched them with reliefs in gold, silver, steel, and ivory, with precious stones, with enamels, and with decorations of every kind, could only be suitable for the missals, and the antiphoners placed in churches. On seeing at the Exhibition, inclosed in the beautiful articles of furniture from Austria, the superb hindings in ivory carved with so much art, or in gold and silver d with gems, and enamels still more precious, it might be supposed that these were shrines inclosing stered relies, or even the casket of Durius, in which Alexander deposited the poems of Homer.

Between simple bindings and those in which costline is carried to extreme, a medium may be found which lovers of books delight in, combining elegance with solidity and simplicity, qualities preferable to richness of gilding. At the period of the Rennissance, artists of great taste executed admirable bindings for kings, princes, and a few rich and learned amateurs whose names are preserved in the recollection of histopoles, who main-tained in their bouses binders whose taste they directed.* Some chose the Byzantine style; but the greater portion adopted the style called the Resaissance. After them, the hinders confined themselves to initation, applying this style of ornament indiscriminately to every species of book. Some attempts have been made to submit bookbinding

to general principles, and to adapt the hinding either to the period in which the books were written, or according to the subjects of which they treat; and a variety of ornaments have been devised us consequence. The idea, though a happy one, is not new, but has not generally * This is probably the cause which has kept us in igue-

rance of the names of these artists.

been adopted. We have seen the cap of liberty, the owl, and the ward of Æsculapius applied to hisdings with respect to the contents of the works. The Egyptian, Grecian, and Roman ornamental emblems have been resorted to, as well as the Gothic borrowed from monuments, Others have thought it desirable that bookbinders, departing from the beaten track, should endeavour to give a more peculiar character to their bindings, a character which should mark our era; and that thus the choice of colours-more or less sombre or more or less brightmight always be in accordance with the nature of the subject treated of in the books. They contend that this system would at once afford, in a large library, the advantage of facilitating the search for books by immediately striking the eye: that it is also to be desired that certain styles of ornament should indicate whether such a work. on Egypt for example, belonged to the Pharaonic, the Arabic, the French, or the Turkish era; and that it should be the same with ancient Greece, Byzantine Greece, or modern Greece, the Rome of the Casars or the Rome of the Popes. All these suggestions may be oseful if they are placed

der the control of taste and judgment Modern bookbinding is carried on in England on a

scale of such magnitude as the binders of former times could scarcely have foreseen. The production of books greatly exceeds that of any former period, and has caused the application of so much machinery to bookhinding, that it may fairly be said to have become a manufacturing business. Books, handsomely bound, gilt, lettered, embossed, and otherwise ornsmented, no longer depend npon individual skill; but are produced, with extraordinary rapidity, by the aid of machinery. Mr. Barn, of Hatton Garden, first introduced rolling-machines to supersede hammering; the iron printing-presses of Hopkinson and others were altered to form arminepresses, hy which block-gilding, blind-tooling, and em-bossing can be effected with accuracy and rapidity. Leather covers, embossed in elaborate and beautiful Leather covers, embossed in elaborate and beautiful patterns by means of powerful fly-preses, were introduced by M. Thouvenin, in Paris, about 25 years ago; and aimset simultaneously in this country by Messramian and the pattern of old plough: the cutting-tobles with shears, invented by Mr. Warren De La Rue, and now applied to squaring and entting millboards for book covers; all these means and contrivances, indispensable to large establishments, prove that machinery is one of the elements necessary to enable a binder on a large scale to carry on that business spe-

Mr. STARR, of New York (88, p. 1438), had, in the United States Department, two machines, one for backing, and one for finishing backs; but the Jury were not fortunate enough to see them at work, although they made many applicatious for the purpose,

Binding in cloth-boards is carried on with such radity by houses like the Remnants, the Leightons, the Westleys, and others, that 1,000 volumes can be put in cloth, gilt, in six hours, provided the covers be previously got ready, and this can be done in less than two days? Notwithstanding all these numerous improvements, the Jury could have wished for some advantages and real progress in ordinary leather hindings, where large quantities are not bound at one time. Those in the Exhibition were experally well executed; but the price is still high in proportion to that of the books, the cost of which has been much reduced by modern improvements in printing and paper-making.

France applies handing in boards chiefly to ephemeral books, which must attract the eye by their splendour, and which are intended either to ornament the drawingroom tables or to be given as prizes, and especially to books which are exported to South America. The books which are experted to South America. The hindings in boards exhibited by M. Mars, of Tonra (Frace, 321, p. 1192), display elegance combined with a relative degree of solidity.

25 0 0

It is to be deployed that appearance should be so often preferred to reality, and that instead of the solidity which our fathers sought before everything, the inconstancy of our age should, by a contrary excess, prefer changeable-uess and variety. But, after all, books cannot be surrounded by too many attractions in order to inspire all classes with a taste for reading.

For bindings in boards a system has been for some time adopted, of employing ornaments allied by their style of design to the subject treated of in the book

covered by them.

Amongst the beautiful hindings exhibited by the different bookbinders, the Jury have particularly remarked the works of the following exhibitors:-

BOOKBINDING-ENGLAND.

REMNANTS and Co., Lovell's Court, London (5, p. 837). -The design shows excellence and good taste; their workmanship is perfect; and in the application of carved wood to binding, by the patent mode of burning in the pattern, a great degree of beauty and cheapness, compared with carving, is attained. J. S. Evans, Berwick Street (8, p. 537) .- An impe-

rial 4to albam, bound in vellum, illuminated by Joseph Stuart Evans, with the rose, shamrock, and thistle, intertwined and inclosed within a border of gold and colonis The interior of the book embellished with illuminated pages of various designs, and on the inside of the covers the arms of Her Majesty the Queen and His Hoyal Highness Prince Albert, also illuminated by the same method. The clean and superior finish of this album deserves great praise. An album in the Etruscan style, black kid inlaid npon a brown ground, the edges of the leaves ornamented to correspond. The Art Union Illusleaves ornamented to correspond. The Art Union Illea-trations of the "Pilgrim's Fregress," bound in moreou-finished in outline; the subject, "Christian met by Exam-gelist." By lines and gauges; a style of decoration totally unswited for the purpose. The gold is well worked and bright. The whole of the binding exhibited by Mr. Evans is well executed. Messrs, LEtouron, of Brewer Street (24, p. 538).

- These bookbinders evince, in various styles, great perfection, and all kinds of binding seem easy in their hands. Their manner of restoring fac-similes of missing pages to valuable works is first-rate. A quarto Lexicon, unfinished, showing a new mode of covering a book in such a manner as to preserve the strength of the leather at the joints. This appears to be an advanthe tester at the joints. This appears to be an available, tage. The taste displayed in the Royal Bible, with heavy ornaments, was inferior and of less happy adaption to the subject than Luke Limmer's general designs.

Mr. Josean Westley (48, p. 540),- Spenser's works in white vellum, a 4to Bible in russia antique, and other specimens, show excellence in workmanship. Mesers. Bowg and Soxs (52, p. 541).—Their speci-mens of hinding attracted the attention of the Jury

by the cheapness and general excellence of their cloth R. J. HAYDAY (106, p. 544) sustains bis well-earned

reputation in the bindings exhibited by Cundata and Apper M. D. BATTEN, Clapham Common, London (59, p. 541)

The books exhibited by him were elaborately worked, — The boost extended by any over accountry when although requiring more careful attention in finishing.

J. Watturr, of Noel Street (130, p. 545).—"Das Nielelungenlied," royal 4to. A fine specimen of veilinn illuminated bioding, in the Grelier style, the design has n English workman. The price of bioding, ivd. "Pogin's Glossery," royal 4to, inlaid illuminated moreov, well and expensively extented; the design taken from the contents of the book, and adapted to the deco ration of the binding. The price of the binding, 162. Owen Jones and Humphrey's illuminated books of the middle ages, imperial folio, dark-brown moroceo, blindtooled in imitation of the old monastic binding. The manner of fastening the leaves so as to open freely, by means of silk joints, appears apperior to caontchouc, where so large a book is required to open freely without

twisting. Price of binding, 4l. "Silvester's Universal Paleography," imperial folio, brown moroceo; the sides beautifully and accurately tooled in the old French style. in gold. It is a first-rate specimen of forwarding, solidity, and correct workmanship. Price of bioding, 4l. Domestic Animals of Great Britain," chastely decorated and good workmanship. "Rogers' Poems," and "Italy." specimens of rich and accurate tooling, the edges marbled and well gilt over. "Memoires de Napoleon, A specimen of emblematical binding. "Bolin's Standard Library," in calf gilt, is a fine specimen of sound, durable, " Bohn's Standard and neeful binding, and the price moderate, being 3s. 6d. per volume. "Bohn's Classical Library," as a revival of the English style of binding of the period of 1760, with bigbly-raised boards, is another specimen of superior workmanhip. The whole of the s reputation Mr. Wright has acquired. The whole of the specimens justify the

Messrs, WESTLEY and Co., of Friar Street (111, p. 544) had, among other well-bound specimens, a royal folio Bible in purple morocco, bevelled boards, richly enchased gilt clasps, corners, and centres. The interior of the boards worked in gold, the edges of the leaves illuminated in gold and colours in the missal style. The cost of this binding is 75t. The workmanship is bighly meritorious, and proves that if work can be so well and elaborately executed, it is worthy of better designs

Messrs, Maconnie and Co., Percy Street (26, p. 539),-A Cambridge folio Bible, red morocco, gilt centres, one in tortoiseshell and buhl; a royal 4to Bible in russin, and numerous other specimens, showing many points of great merit, but somewhat deficient in the ficishing, an error which could and should have been avoided, particularly where so much elaborate work is bestowed. The prices given are-£, s. d.

Mrs. Lewis, Duke Street (163, p. 547).—" Horne's Commentary," "Glossary of Architecture," and other works, among which was one in the Gothie style, all bearing evidence of good and careful workmanship.

Mesers. Barnerr and Co., Fleet Street (196, p. 550). Specimens of carefully and well-executed work, among which is a royal 4to Altar Service, ultramarine border round the pages, and carved wood boards, covered in Turkey morocco: the electro-metal corners and centres deserve mention. Mr. Barrett had also numerous small Common Prayers and Church Services, perforated and

engraved, solid covers, &c.

Mr. P. Sapsporn, London (35, p. 539).—An illuminated and elaborately finished 4to Bible, in red morocco, with metal edges.

Mr. TARRANT, London (43, p. 540). - The Works of Sir Thomas Lawrence, morocco illuminated, neatly

Mr. Nezz, Edinburgh (91, p. 543). — An imperial 4to Bible, white morocco, super-extra, morocco inside, with satin fly-leaves, the outside of the boards and back hand-tooled and illuminated. A fine specimen of what can be effected where care and judgment in the execution are combined, even under the disadvantages of working after a day's hard labour, this Hible having been bound in the winter avenings, by gas-light, after Mr. Neil's daily

Mr. Budden, Cambridge (97, p. 544).—An Alham, inlaid in colours, with interfacing band pattern, inside joints, and inlaid vellum, gilt and painted, displaying great care, skill, and taste in the execution.

Mr. Oux, London (109, p. 544).—A number of volumes neatly blocked, and a thin book under the title of "Fiddy," very neatly bound.

Mrs. LEIGHTON and Sox, Harp Alley, London (156, p. 547).—Various specimens of blocking, some in silver, said to be protected from tarnishing. "The Women of the Bible," a volume showing good block-gilding.

Mr. Riviner, Great Queen Street (89, p. 543).—
A volume, "Virgili Opera," royal 8vo, inlaid white morocco, inside covers tooled in foliated curves, beantifully put out of hand; "The Chronicles of England," 4to tree-marbled calf, also a fine specimen of this style of binding.

Mr. JOHN CLARKE, of Frith Street, Soho (68, p. 541).—Sir Joshua Reynolds' "Discourses," and a folio Bible in the Harleian style; a Bible in antique morocco, single hand-tooling, remarkable for its extremely well forwarded and finished style of work. Four volumes in calf, tree-marbled, in which Mr. Clarke excels.

Mr. Macnata, of Glasgow (117, p. 544), Mr. Clark, of Dunfermline (68, p. 541), Messrs. Clark and Donalison, of Mauchline (135, p. 545), exhibited specimens of

average workmanship. After having attentively observed the amount of elabo-

rate work which is bestowed on most of the productions exhibited by the bookbinders of the United Kingdom, the Jury cannot disguise the fact that there is a general want of good designs; and they beg to remark that more attention should be paid to a subject which impresses a special character on the products of a country. The attempts at emblematic hinding are generally not very successful; but the imitations of the old English style of hindings are a nearer approach to simple, useful, and good work.

BOOKBINDING-FRANCE.

M. Nitinara, of Paris (665, p. 1211), exhibited numerous works, among which several are forwarded, designed, and finished in a first-rate style. The ornamental tooling in gold is a near approach to all that can be desired.

A. LORTIC, Paris (1652, p. 1256), among other works bound in a superior manner, a large folio "Balbas de Janua," illuminated Greslier intersected pattern, with the iusides elaborately gilt, is deserving of high praise. Some few specimens of very thin books displayed a

degree of skill seldom surpassed. Maxiame Gauxa, of Paris (857, p. 1221), exhibited a smaller number of elegantly bound books than could nive been expected from her well-known establishment, Those that were in her glass-case were principally orna-mented in claborately carred wood and ivory. A large folio, "España Artistica y Monumenta," red morocco

illuminated, intersected pattern, deserves comm for its elaborate workmanship. M. Siniea, of Paris (693, p. 1212): this name brings back recollections which impose duties on his success whose specimens contain merit of only an average kind. M. LE BRUN (No. 906, p. 1233) and M. AUGUSTE DAUTHUILLE, of Paris (1171, p. 1233), exhibited bindings

of an average description The Jury regret that MM. BEAUZONNET, OTTMAN, CAPE, and other eminent bookhinders in Paris, have ubstained from sending their works to the Great Exhi-

In general, the bindings of French artists are remarkable for a superior degree of taste in their design, as well as for neatness of execution in the hand-tooling and finishing. Their best designs, however, are imitations of old artists.

BOOK DENDENO-A DEPOTA

Bookbinding on a large scale is carried on in Vienna and in Pressia, where also the manufactory of finery leather articles has considerably increased of late years, The principal part of the specimens exhibited were placed in M. LEISTLER'S rooms, enclosed in a bookcase, and as the Jury were informed that these goods were private, there was a certain degree of delicacy in asking more than once for leave to inspect them. The names of the binders and ornamenters of the books and album-cases were not found by any number affixed to the cases, and it was not until the 20th of June that it was comm cated to the Jury that the books, &c., were exhibited by individual persons who were desirous that they might not escape notice.

The designs of the portefeuilles exhibited by M. HABENICHT (376, p. 1029), bookbinder of Vienna, are by Professor CHARLES RAESNER and Professor VAN DER NCLE, and show what can be accomplished when artists are employed, instead of leaving the workman to follow his own notions of what constitutes appropriate ornamentation. These portefeuilles, got up by M. Habenicht, can only be noticed in this place for the very superior work-manship displayed in gilding and ornamenting, fur they do not constitute bookbinding in its strict meaning. the portefeuille-cases in the shape of books are specimens of first-rate workmanship and appropriate design, and reflect great credit on M. Habenicht and the artists who designed them.

The following is a list of six of those elegantly finished and ornamented productions:-An elephant folio, in dark-blue velvet cover, with the

figure of our Saviour and Cross, in chased silver, in the An elephant folio, green velvet, with exquisitely

pierced ivory ornaments. An elephant folio, with tortoiseshell cover, profusely ornamented with inlaid metal ornaments, Gothic design, pierced ivory and coloured glass border, silver and gilt device of three figures in the centre; the lettering in exquisitely formed raised letters of metal gilt.

An elephant folio, in blue and red morocco, illuminated in gold, with rose bouquet, and raised intersected ornaments, in ten compartments, each filled with highly finished tablean x An elephant folio, in dark puce velvet, raised gold or-

naments, with three small ivory figures, and beautifully carred ivory ornaments round the sides. An elephant 4to, light purple velvet, profusely orna-mented with gift metal, ebony, and pearls; females play-ing harp and into in the ecutre, in gift metal. Raised

gilt letters, top, bottom, and sides. M. Geras Det, of Vienna, bad also two beantiful por feuilles, designed by Professor Charles Raesner, and of erfect workmansbip. One an elephant folio, covered in light blue, red morocco tooled border, gold and ivery scroll ornaments, gilt metal centre, with female figure holding a tablet, in gilt metal, on n brown ground, with the names of celebrated Austrian music composers-perfeet in the forwarding and finishing. The other, an elephant 4to, in dark-blue velvet, bronze and gilt metal, raised intersected pattern in fourteen compartments, ornamented with gold, with highly finished drawings of the costumes of Austria, and the imperial arms in the centre, in brouzed and gilt metal

M. Ginander had also in the book-case apwards of 200 volumes of books, exquisitely bound. The whole of M. Girardet's productions were supposed to be with the book-case, and not exhibited for competition, and no iuformation was afforded to the Jury to enable them to view them as a collection placed there by an exhibitorthere was neither number nor name to indicate who was the binder. Considering the superior workmanship, it is probable that M. Girardet would otherwise have received the marked approbation of the Jury by their awarding him a Prise Medal.

BOOKBINDING-THE ZOLLVEREIN.

Only two bookhinders have submitted specimens, although some of the booksellers and printers, combining M. Schornino, of Berlin (1 Zollv., 154, p. 1057), exhibited a large Altar Bible in morocco, well bound. M. GRAF, Duchy of Saxe Altenburg (1 Zolly., 746, p. 1091), a large Altar Rible in purple morocco; as a specimen of block gilding it is perfect, and considering the large size of the engraved block, which is stated to be in one piece, much skill is displayed in its being so skilfully

BOOKBINDING-NETHERLANDS

M. RECKES, of Rotterdam (112, p. 1141), exhibited the works of Hogarth, in folio, as a specimen of hinding, neatly and curefully executed.

BOOKSINDING-SWEDEN.

M. F. Been, of Stockholm (104, p. 1354), exhibited ten specimena of hinding, possessing fair merit. BOOKBINDING-UNITED STATES OF AMERICA.

Judging from the collection in the American Departmeet, bookbinding has not advanced in that country as much as some other branches of the book trade. The works exhibited are loosely forwarded, and twist in handling; and although much labour is bestowed in gilding and finishing, sufficient attention is not paid to the miour details on which good workmanship so much depends. The fullnwing is a list of the exhibi-tors:-Mr. Il. Baaner, Boston (473, p. 1465)-books in cloth, well blocked. These specimens were enclosed in a case in the form of an immense book, well and neatly covered. Mr. HENRY GASSETT, Boston : 420, p 1462), and Messrs. Lippincoff, Grango, and Co., of Philadelphia (57, p. 1437) - specimens of hinding, of moderately good workmanship. Mr. G. P. PETNAN, of New York (122, p. 1441)—five or six specimens of mediaval hinding. Messrs. Walken and Co., New York (123, p. 1441)- a large 4to Hible in two vols., bound in Gothic style, green morocco, gilt metal ornaments and corners, most claborately worked fly-leaves, illuminated in green, red, and white, with recesses to each side for a family register, embelished paper, and finished in such a manner that when the recesses are shut up the inside of the cover remains even. This is the best specimen in the American Department, and possesses some novelty and care in forwarding and finish-

BOOKSINDING -VAN DIENEN'S LAND.

THE COUNCIL OF THE ROTAL SOCIETY OF VAN DIEMEN'S LAND (345, p. 999) displayed a collection of books neatly bound by Mr. Roawenas, of Hobart Town (196, p. 998); and one volume, said to be gilt and lettered with gold leaf from Californian gold, manufactured by Mr. R. V. Hoop, also of Hobart Tawn.

Vellum Binding.

Vellam binding is a separate branch of the trade, and consists in binding all kinds of account books, from the largest ledger to the smallest memorandum book. The covers are usually vellum, forril, russia leather, smooth and rough ealf, and the larger books are in general neatly worked with russia bands, which add both to their up-pearance and durability. The English vellum hinders, whose works were in the Exhibition, fully sustain their high reputation for heavty of execution and solidity of workmanship. The ledgers of MM. Gaynand and Genatur, of Paris (517, p. 1203), however, show that remarkable progress has taken place in France within the last 10 years in this branch of trade. In the American Department, also, Mr. Hernetck (302, p. 1466) and Mesers. J. and W. McAdams, of New York (482, p. 1465), had ledgers raled in a very superior manner. An improved mode of numbering the leaves of account books has been introduced within the last few years, by books has been introduced within the most rew years, or means of a paging machine, patented by Mr. Shaw. There are other machines for the same purpose; and Mr. Senagaviorin (38, p. 539) had one at work in Class XVII. during the whole of the Exhibition, which is

this branch of the book trade, had also some bound works. | very simple in its construction; and appears to answer M. Schormino, of Berlin (1 Zollv., 154, p. 1057), ex-Mr. Hancock took out a patent some years since for the purpose of applying esoutchone to the manufacture of account and other books: the leaves are fastened together with caoutchouc in a semi-fluid state, instead of stitching them, thus obtaining much greater freedom in opening when the book is bound; this appeared at first to opening when the book and bound; the appeared all others. be a superior mode, and promised to supersede all others. It was not found, however, to be sufficiently strong to mastain the severe wear and tear consequent on the constant opening and shutting of ledgers. It is a process by which books that do not require such constant handling may be bound to advantage, as they open much more freely. It appears admirably adapted for music-books, allouns, small pocket ledgers, and miniar works.

The English exhibiturs of secount books were Messrs. THOMAS and Son, Cornhill (44. p. 540); J. WILLIAMS, of Hucklershury (53, p. 541); Evans, Berwick Street, (8, p. 537); HARRIS and GALARIN, Fenchurch Street (173); ROTSTON and BROWN, Broad Street (34, p. 539); WATERLOW and SONS, London Wall (46, p. 540); Cuwan and Sons (101, p. 544); De La Rue and Co. (76, pp. 541-543), for pocket ledgers; and Mr. Won-benstroon (159, p. 547), whose new mode of fastening the sections with cloth hands appears to be an improve-

From France, MM. GATMARD and GÉRAULT (No. 517, p. 1203) exhibited an immense and well-bound ledger; and M. NERAUBEAU (661, p. 1209), whose various account books were of an average quality. From America, Mesers. Sangle and Mott, New York (339, p. 1456), in addition to those already mentioned.

III. PAPER.

The introduction of paper, first made of cotton, and afterwards of linen rags," dates from the arrival of the Arabs in Spain and Sicily, in this part of Europe, and from the time of the Crusaders as regards the Southern Thus it is from two different parts of the East that we have derived this process, originally inreuted in Chias, where the art of making sheets of paper from the bark of trees, from bamboo, old racs, silk, hemp, or cotton, reduced to pulp, dates from the commencement of the second century of the Christian

era 4 The use of popyrus, manufactured in Egypt, cessed in Europe about the minth century, and the cutton paper, then in great use in the East, was introduced into Europe at this time, through the commercial relations of Venice, Naples, and Sicily.

Edrisi, who wrote in 1150, tells us that the paper made

at Xativa, an ancient city of Valencia was excellent, and that it was exported to the East and West. At the commencement of the fourteenth contary there existed at Fabriano, in the Picenum, and at Colle, in Tuscany, paper-mills moved by streams of water.§ It was from these Fabriano mills that Bodoni, at the comwas from these Factumos must that notion, as the com-mencement of the present century, obtained the paper for his beautiful editions; and this manufacture is still carried on with success, judging from the superb var-made paper exhibited by M. Millalant, of Fabriano (Rome, No. 12, p. 1285).

At Noremberg, in Germany, a paper-mill was established in 1390,

The introduction of paper-making in France dates from the fourteenth eentury. The towns of Troyes and Es-* "Ex resuris pansorum," are the words of Peter the

Builton these strangers in repair and constant modes.

in the Dutch Department.
At the end of the last century (1799), the first trial was made at Essounes, in France, in the paper-mill of M. François Didot, of a machine for making continuous paper. It was the invention of M. Robert, a workman in that establishment, who obtained a patent for 15 years, and a sum of 8,000 francs from the French Govern Some sheets of paper in continuous lengths were then made; but the troubles in which France was involved at that time caused delay in the necessary experiments, which were both tedious and expensive. As soon as the Peace of Amiens restored intercourse with England, M. Didot, jun., convinced of the great utility of the invention, came over with it to seek in England what was then wanting in France-capital engineers and enterprising wanting in France—capital engineers and enterprising paper-manufacturers; he was accompanied by Mr. John Gamble, his brother-in-law, who had resided several years in Paris. Having obtained patents in England, one in 1801, and the other in 1803, they were assigned to Mesers, Henry and Scaly Fonthrinier in 1804. Dartford, in Kent, was selected as the place best adapted for realizing the patentees' plans, and Mr. Hall's establishment as the fittest engineering concern for that purpose. In that manufactory, Mr. Bryan Donkin, since so celehrated as a paper-machine maker, was employed; and to this gentleman the credit of perfecting the paper-machine is mainly due. In 1803, after intense application, Mr. Donkin produced a self-acting machine, or

In 1836, Mr. Brown, of Esk Mills, near Edinburgh, obtained a patent for applying suction-pumps to the Foundrainer machine. He places a rectangular box transversely beneath the horizontal wire-cloth, without the interposition of any perforated covering.

interposition of any perforated covering.

In April 1839, Mr. T. B. Crompton took out letterspartent for producing n partial and continual vacuum
under the wire by means of a fan; and a uniform rarefaction is obtained by this arrangement. It has been
successfully applied since that period at his extensive
mills, Farnworth, near Bolton, Lancashire.

The first mechine for continuous paper actually made in France was constructed at Sord, new Anet, by Mosars, Berts and Grévénich, under the directions of M. Didot, who has decided a patent for maker. The mechines first made in France were very inferior to those made by Mesars. Dookin, consequently the supplied the principal paper-stakers in that country with machines made by him Novi viltastanding the great benefit derived by the per-

fection of the Didot and Fourdraine paper-machine, and the immose quantities of paper produced by three and the immose quantities of paper produced by these papers and the immose quantities of paper produced by the paper paper. The vas effected by invention were fully developed. This was effected by means of a cloth or clothe, against bessel cylinders, such as the paper paper paper was made as cloth or clothe, against bessel cylinders, such as the paper paper was made in the paper paper. The paper was made in the paper paper was made paper paper was made paper paper was made paper paper. The paper was made paper paper paper was made paper paper paper was made paper paper paper. Enoch Taylor, obtained a "patent for enting paper longitudinally, by means of revolving circular blades." In 1829, Mr. Firmin Didot introduced into his mill, at Mesnil, Mr. Comptou's drying process. This was the first time that it was put into operation in France

Fine writing-paper is now made, sized with gelatine, dried, and cut into sheets, nt the rate of 60 feet a minute in length, and 70 inches in width, at the works of Mr. William Joynson, at St. Mary Cray, Keat, which produces, from only two machines, the large quantity of 25 tons per week.

The paper used in England for newspapers is required to very strong and firm: to obtain these qualities it is sixed with polatise. To Mr. T. B. Crompton is due this mode of string with relies. The amount of Excise duty on paper made by him has been no less than 15,000, per annus, taking an average of ten years, and now xearing \$2,000 the property of the property o

In Americal ISM, the late Mr, Thomas Barrat, of St. Mary Cory, obtained a patent for inserting the water-mark and maker's name to continuous paper, so as to the continuous paper, so the continuous paper, so as to the continuous paper, owing to the perfection he attained in making genter, owing to the perfection he attained in making genter, owing to the perfection be attained in the continuous paper, or making the perfect perfect to the perfect of the perfect paper or my other grinding material; and, by continuing the perfect perfec

purposes requiring great accuracy.

In August 1831, M. Jean Jaques Jegnier obtained a
patent for making continuous paper with wire marks,
similar to the laid papers usually made by hand; to which
the preference was still given for their greater strength
and peculiar appearance.

In 1830, Mr. Ibotson, of Poyle, paper-maker, obtained a patent for a peculiar construction of strainers nisted the getting up of these strainers to Nessr Donkin, who used great care in their manufacture. By Mr. Ibotson's simple contrivance, the sand, lumps, knots, and other impurities, are kept from flowing with the palp at the moment of its running on the wire web on which the paper is formed. Most countries have since adopted these strainers; and paper is now free from the imperfections which formerly caused so much damage to types in the printing, spoiling large founts and valuable wood-cuts, after they had been in use only a short time: this great improvement also superseded the operation of picking the lumps, &c., after the paper was made, which caused so much retree (damaged paper) to otherwise good and well-made paper. Other kinds of strainers are used; but few are found to work as well as Ibotson's, made by Doukia and Co. Mr. John Wilks, a partner in the firm of Donkin and Co., obtained a patent in 1830 for a channelled and perforated roller, technically called a "dandy," to remove part of the water from the pulp, to facilitate conching, to emble paper to be made with increased rapidity, and to close its apper surface. gentleman manufacturers are greatly indebted for many valuable suggestions and improvements in the namero ntensils and implements required in the making and

fishishine of paper.

Glazing of Paper.

High glazing, now universally adopted, was first introduced by the late Mr. Heath, about 35 years ago, at his pasteboard manufactory in Hackney, and for many years the means be adopted were not known. On the introduction of steel pers, there was an increased demand for smooth papers, and a desire to obtain the highest possible

finish. Other card and drawing-board makers applied

• Mr. Joyason since the Great Exhibition has remedied this inconvenience by a very ingenious process.

manufactured in

Mr. Heath's process, and it became the custom for wholesale stationers to send post and other writing papers to the eard-makers to be glazed or satioed. A patent having the curv-makers to or gazaci or sanced. A patent narrog been granted in 1832 to Mr. De La Rue for "certais improvements in playiog-cards," in which he applied printing in oil, instead of the old way of steeniling with water colours, he adopted the mode of passing them between copper sheets through powerful rollers, natead of the usual mode of glaning by friction with a flint, and subsequently he attained a higher finish in fice writingpaper than had hitherto been effected by submitting it to the same process.

Glazing is now earried on at most of the paper-mil in all countries. Writing-papers have also been glazed in long lengths; but as the naked rollers through which the paper passes become indented after having been only better mode is to pass the paper several times through a calender, having an iron roller at the top and bottom, and a paper roller in the middle, the iron rollers being slightly heated by steam. This plan is useful where ebenpuess is necessary; but it is nevertheless an inferior sort of glazing, and does not long maintain its gloss. It has been practised many years by Mr. Crompton for strong brown preking-papers. The Weamoutt Parka Cospany (149, p. 546) exhibited, through Messrs. Venables, a first spacinger of brown water shand it. a fine specimen of brown paper glazed in loog leogth; and Mesers. Daxwsen and Co. (Denmark, 4, p. 1335, 1356), of Silkeborg, in Jutland, Denmark, have exhibited a large roll of ercam-laid writing-paper well glazed, not satisted, in long length. There is no difficulty whatever in glazing paper in long lengths, provided care be taken to obtain very true rollers. A thin ductor-blade should be fixed in a proper position to detach the sheets as they pass through, as the electricity which is developed causes them to adhere to the eylinders, particularly where rosin size has been used.

Paper Bleaching.

At the end of the last century, M. Berthollet's diseovery of the means of bleaching with chlorine was suceessfully applied to paper-making; and by this valuable rocess coloured rags, ropes, &c., were converted into fine white paper, but the improper use of it deteriorated the quality, and recourse was therefore had to the use of chloride of lime, and to a better system of washing the pulp, for which purpose washing drums were introduced by Mr. Breton, and perfected by Messrs. Blanchet and Kleber. As a further precaution against the deteriorating effects of the use of chlorine or its compounds, some makers use anti-ehlor, such as sulphites, to neutralize the small particles which might still remain in the pulp after

bleaching and ordinary washing.

The rotatory rag-washing machine, invented by Messrs.

Donkin, has the advantage of enabling the boiling operation to be performed under high pressure: the mechanism continually lifting the rags out of the lye and plunging them back insures complete and uniform action. may be used repeatedly by adding fresh doses of alkali-M. Jonrnet has adopted the plan long followed in England of using the waste wash-water of his mills for manuring land.

The ehloride of lime is cheaper in England than in France; it is made principally at Glasgow as a secondary product of the soda manufacture; the price in 14s. per ewt. (about 30 fr. the 100 kilogrammes), whilst at Ronen or Paris it costs 47 fr. the 100 kilogrammes, being 56 per cent. dearer, a disadvantage to which the French manufacturer is subjected on one of the most important raw materials used in paper-making, as the importation of ehemical productions is prohibited in that country. The difference of price is from the great disparity in the cost of fuel; coals are sold in England at an average of 4s. per ton (5 fr.); in London 15s., or 18 fr. At Rouen, coals cost 33 fr. per 1,000 kilogrammes, to which must be added the cost of cartage to the different mills.

are fewer waterfalls than in France and other parts of the Contineut. Although steam is more expensive than water power, it is more available, and mills using it are not subject to stoppages from floods and shortness of water

In France and other countries where mills are near large forests, it is cheaper to use wood than eoul; but England has great advantages from the cheapness of its fuel, particularly for steam drying. Where mills are in unfavourable situations, without coal, the cost of drying the paper is considerable.

Englind and France obtain the greater quantity of manganese from Germany; the price of which is therefore about the same in both countries. Rosin is imported from America and Russis, and some is produced near Bordenux. Alam and potato-starch are about equal in price in England, France, and Germany. Muriatic acid is dearer in England than in France, where the price is now very much reduced.

Paper .- Price of Labour,

Although the price of labour is, in general, higher in England than on the Continent, yet owing to the care and skill of the English workmen, and the great superiority of the machinery employed, it is doubtful whether the cost of the manufacture of paper be not as cheap in Earland as in other countries. To ascertain the merits of the manufactures, quality and price of the paper being considered, it would be necessary to have exact data as to the rate of labour in different countries, and even in each locality, as the price varies according to the greater or less distance of the mills from the capital; for example, in France the price of labour in the Vosges is much less than near Paris, but this advantage is conoterbalanced by the expense of carriage, which is always greater in the case of mills distant from the centre of consumption. These points have been considered by the Jary according to the best information obtained, and they find thut mills established where civilization has made little progress are the most favourably eircumstanced. The price of rags mainly regulates that of paper, and the value of rags is always in proportion to the degree of civilization and prosperity of the country. Thus Sunyma, which seem years ago converted its rags into coarre boards, and sold them to the paper-makers of Europe for toaking paper, now makes good writing and other papers, the low price of which proves that both the raw materials and the labour must be cheap in that part of the world

In proportion to the progress of civilization, paper-machines have been introduced into the different parts of macaloes have been familiary possesses a great number. South America has now begun to obtain them from the United States. In Africa there is only a small vat-mill at Bonlac, near Cairo.

The following is an necount of the number of pape mills in England, Scotland, and Ireland, and the number of beating-engines employed; also the amount of duty charged on paper, the quantity imported from various countries, and the amount exported from Great Britain in the year 1850. (See Table, p. 430.)

By a Parisamentary paper, published March 9, 1852, the number of paper-mills at work in England on the 18th Fehruary, 1852, was 304 in England, 48 in Scotland, and 28 in Ireland, making 380. There were 1,616 beating engines at work, and 130 silent.

Sharp, in his "Gazetteer," ed. 1852, p. 977, states the number of paper-mills to be 800, employing 50,000 hands; but the Table (p. 430), obtained officially from the Inland lievenne Office, gives the number of mills as being only 415, iocluding Eogland, Scotland, and Ireland, The amount of duty charged in the year 1850, shows

the enormous amount of 62,960 tons weight of paper pro-duced in Great Britain in one year! The first papermachine was erected in 1804,*

Quantities Imported into the United Kingdom

The waste* of the Munchester cotton-mills, and that of the spinning-mills in England, Scotland, and Ireland, produces enormous quantities of material, which is now skilfully applied to paper-making, and, when mixed with rope, bagging, &c., produces strong and good paper for

Of the large number of paper-makers in Great Britain and Ireland, a few only have exhibited, namely:—Mr. JOYNSON, of St. Mary Cray, Kent (42a, p. 540), who exhibited a large assortment of blue wove, blue laid, large bank post, eream laid post, blue laid post, and cream laid foolscaps; the 54 lbs, thin large bank post, in imitation of the French pelure, was not equal to that exhibited by the French manufacturers, although a nearer approach than any yet made in England of that weight. The post and any yet made in England of that weight. The post and other papers were all of high qualities, fully maintaining Mr. Joynson's reputation as a first-rate manufacturer. Mr. DEWDNEY, of Collumpton, specimens of excellent eream laid writing-papers, and also some unchangeable hlue papers of superior manufacture for the use of stareh-makers. Mr. Saundens, of Dartford (36, p. 539), strong parchment paper, for printing shares, and other purposes where great strength and tenacity are required; plain and coloured bank-note papers, of strong texture, with a variety of water-marks of elaborate and complicated designs; white and coloured safety papers, for printing bankers' eleques, letters of credit, &c., detecting the removal of writing by chemical reagents, and some specimens of n new method of making papers with waterspeciment of a new memora of infaring papers with water-marks, giving gredations of light and shoulder the whole of these papers were of excellent qualities and make. Westra, Cowan and Co., of Edinburgh (101, p. 544), a variety of printing, writing, sote, and letter papers. Mr. WILLIAW WILDER, of Soodland, Rochester (102, p. 544), some specimens of writing-papers, with wreaths of flowers in the water-mark. Messrs. Bancus Browners, Chesham (96, p. 544), patent writing-papers with or-namented water-mark, Mr. CHARLES VENABLES, Clifden and Soho Mills (149, p. 546), specimens of well-made and fine quality plate, lithographic, and printing-Mr. GEORGE VENABLES, strong and good wrapping-papers (149, p. 546). Mr. Edward Snith, Gateshead, strong brown paper, manufactured by Messra Thomas Gallon and Co. Mr. Lann, of Newcastle (147, p. 546), pottery tissues, of excellent quality. Mr. Formp. 546), pottery tissues, of excellent quantry. Mr. Pott-BRINIER (100), p. 280), also had some pottery tissues, of good quality, in Class VI. Mr. Alfrazo Hanez, of Horsforth, Leeds, &c. (64, p. 543), prees papers, for pressing woollen elothe; and brown papers, rolled and glazed, of good qualities. Mesers: Hastrisos and Mellans grazer, of good quantities. Meestrs. Flastings also MELLIN (65, p. 543), brown paper, glazed nod unglazed; and press papers, of good qualities. Meestrs. Whitevand and Soxs (98, p. 544), produced sonne fine specimens of press papers. Meestrs. Vexamlers, Wildows, and Triers, of Queenhithe (149, p. 346), and Meests. Seiters (42, 540), of Bridge Street, wholesale stationers, enabled the Jury to ascertain the state of the paper trade in this country, by the ample and varied specimens which those houses have submitted to public inspection in Class XVII. Messrs. Dr. La Rue and Co. (76), as paper finishers, displayed every description of the best writing papers produced in England, thus affording the means for judging of the high state of finish which this important branch of manufacture has reached in Great Britain.

* The quantity of cotton-wool imported in 1845 was sever bundred and twenty millions and a half pounds weight above one thousand tons of raw ention are required for daily consumption cosumption. In 1850, one million eight hundred and wenty-two thousand hundredweight of flax was imported Liben and flax are spun to the value of ten millions sterling annually.— Vide "Sharp's New Gazetteve," edit. 1852, p 9:6. Chevaller Chaussen's discovery of fiax-cotten, which promises to extend the growth and manufacture of fiax, promises to extend the growth and manufacture of flax, cannot full greatly to increase the best description of raw material for poper-making. In 1775, a description was given by Lady Maire, and pablished in the Transactions of the Society of Arts in 1783, of a new method of reducing flax to a fine fibre by means of an alkaline solution: the specimens were retained by the Society.

Writing-Papers in Packets,

Immediately after the introduction of the penny postage* in this country, there was an immense increase in the consumption of fetter and note paper, and a total change in the sizes was required. Until 1859, 4to letter-paper was put up only in balf reams, and retailed in loose quires or single sheets, at prices varying from 6d. to 1s, per Very superior letter and note papers are no sold in neut and convenient packets at from 1s. to 2s. 6d, per five quires. The patent cutting-machine of the lato Mr. George Wilson proved a powerful auxiliary in en-larging the sphere of this branch of the paper-trade, by accelerating one of its simplest operations, cutting in letter and uote size. Without its aid it would have been scarcely possible, by band labour alone, to supply the daily increasing demands of society for note-papers since the introduction of the cheap postage. This is one of the innumerable common-place instances which show that the full importance of machinery in the commercial progress of the community is not duly appreciated, unless time and quantity are taken into the estimate as well as difficulty. It is to Mesers De La Rue that the new sizes and improved mode of putting up paper in convenient forms are due. The quantity and variety exhibited by them and others are evidence of the encouragement given by the public to this orunmental mode of packeting letter and note papers, for each size of which euvelopes are made to

The following exhibitors also displayed writing-papers

in puckets, viz.:Mesers, Donns and Co., London (79, p. 543); Mesers,
Cowax, of Edinburgh (101, p. 544); Mesers, Spicen BROTHERS (42, p. 540); and Messrs, VENABLES, WILSON, and TYLER (149, p. 546),

Foreign manufacturers have adopted the mode of making up letter and note paper in ornamental packets, and they have exhibited a variety of good specimens, among which were-

France.-M. Marton (609, p. 1207), M. Berrot (1084, p. 1230), and M. Valant, of Paris (1514, p. 1249). Belgium,-MM. Gopts and Sox (284, p. 1160), and M. TARDIF (281, p. 1160), of Brussels.

M. Tandri (281, p. 1160), of Brussela.

PAPER-MAKING-FRANCE.

France, besides importing yearly from America 22,000,000 bis. of cotton, and ultimately converting a large perion of this into rars, the export of which commolity is forbidden by the Freche law, is also in a favourable position with regard to other raw materials, such as hemp and lines rags. Unfortuneley, the introduction of strong alkalies, used in washing in large towns, greatly deteriorates, there and elsewhere, the materials for paper-

making.

The oorthern countries, where hemp and flax are abundant, are in geoeral favourably situated with regard to the quality of the rags.

There was in the Exhibition a species of paper made

There was in the Exhibition a species of paper made in the Sandwich Islands, from vegetable substances, retaining the original strength and flexibility of the raw unterial.

Novy Theore glant is expalse of being converted joinpree. Many stimped here been under in this and other properties of the propose of the properties of the properties of the substances for that purpose, but the great water and expansing in converting these substances that properties of lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering rapis become so acree as greatly to enhance lowering the properties of the properties of the solid, which would be considered the properties of the substance, as was related to that enhanced by M Gasta At the Proteck Endomine of 1928 and 1924, there were

At the French Exhibitions of 1872 and 1844, there were precinized for player made with the leaves of the humantree and similar plants. The leaves of the humantree and similar plants of the leaves of the humantree and the leaves of the leaves of the leaves of the substances from foreign matter, M. Bocques etablished sowerful works at Hanamah, to wash and coover them sowerful works at Hanamah, to wash and coover them state the leaves of the leaves of the leaves of the state the absolute necessity of strong blenching caused a water of more than one-third of the original weight

M. Paccuer (16, p. 181) symbiled in the Algiers Department of the Great Exhibition specimens of paper mode of the dwarf palus (Chameropa Sandila), which almost is that court, and could be obtained serry year, at a triting cost, by causing it to be gathered by women and children, no that it might be had for two frames the true trained while to its green state, it would yield 56 per cent. of its weight, and dry. 50 per cost; and that two loars bearing would be sufficient to recode this half-stoff of the control of the control of the court of the court of M. Diddt states that there are 200 machines in France.

M. Didot states that there are 200 machines in Frasoc, producing cach 700 kilogrammes per day, or 195 tons each per year, making a total of thirty-nice thousand tons, sod 250 vats, producing over two thousand tons more per year, being a gross amount of forty-one thousand tons.*

MM. Goux and Sox, of Huy, Eige (244, p. 1100)

amplian, hat the for exportation. Figur we largely displayed an extrained endersion of every description of impaction of the control of the state of the control of the c

Rowe.—M. MILLANI (12, p. 1285) exhibited specimens of drawing and plate papers, of excellent quality. Densork.—MM. Dawssex and Sooxy, of Silkeborg, Juliand (4), exhibited specimens of writing-paper, milled in long lengths, stated to be by a new process. The finish is not equal to the highly-glaned papers called sotted, but as mill-plazed the specimens were good.

PAPER-HARING—THE ZOLLVEREIN STATES.

The manufacture of paper has rapidly increased in the German Zollverein within the last few years. The States not only now produce paper sufficient for their own con-

the entire population, as proved by manufacturers who other their gas within errain districts; this attenuest the control of the control of their state of the control of the control communition of their and cetter. The Zellverine, according to the last cetters, bad a perpandicular to the control of their contro

It appears from the above that stationary forms a large portion of the raports, which comize if nunerous small articles, such as porte-monaics and similar pools, for which Berlin and other Zollverein large cities are celebrated. From 1844 to 1847 the annual amount of ragimported exceeded that of the exports by nearly 11,000 cwts. In 1845 this excess of imports was reduced to 4,500 cwts. In 1849 and 1850 these amounts increased;

e and in the latter year the imports were 8,386 cwts, and lite exports 1,564 cwts, shwing an excess of 6,752 csts, or frags imported more than those exported. The first poper-meakine was established in Berlin in 1812 cst.

Trinting keeps pace with paper-making. The circulation of periodicals is very considerable. In 1840, Prassis on alone had more than 300 newspapers and periodicals, and (if the number has since greatly increased. In Germany

the great number of scientific works form an important branch of the book trade. The catalogue of the Leipies fair of Easter [53] great the titles of upparation to the fair of Easter [53] great the titles of upparation to the number. In 1850, 16,783 evts. (Zollverein standard) of books were imported, and 24,897 evts. exported. In Prusias alone there are 24 type-foundries, in which 24th workmen are employed; in the Zollverein above 50

workmen are employed; in the Zouveren above of Good workmen, and Romosem and R

printing and music is 574, with 1,154 present, and 3,54, and 954 workmen. Herfin prosenses 23, with 199 pressure, and 254 workmen. The whole of the Zollverien, with the exception of Wartenburg, Brunswick, and Frankfort-on-the-Maine, from which bistes the official accounts are waiting, has 255 exhabilisments, with 2,005 presses, and waiting has 255 exhabilisments, with 2,005 presses, and 8,000 workmen will be the probable numbers. In Market 2,000 workmen will be the probable numbers. In

Lithographic printing is much more on the increase than the other brenches of printing. Leiphic is the centre of the Zellverein book trade, where bookselfers at Easter and Michaelman, to centre with each other and balance their accounts. He'lin is the seat of the Royal Andenny of Seisence, with its own printing-office for difficulties and terreture to the control of
Dound there in great numbers. There were, in that eight none, in 1840, 8 type-fluudrice, with 110 workneer; 25 exhibitments for printing books and music, with 199 revesce, and 354 workneer; 17 exhibitments for copper, presses, and 354 workneer; 17 exhibitments for copper, 141 lithographic establishments, with 265 workneer; 124 lithographic establishments, with 265 workneer; 127 dealers in old books; 43 circulating libraries.

The Jury with pleasure acknowledge their obligations to Professor Dieterici, Chief of the Bureau of Statistics at Berlin, for the valuable Statistics of the Zollverein,

The following is a list of paper-makers from the Zoll-verein who exhibited at the Great Exhibition:-MM. EBART BROTHERS, Berlin (1 Zollv., p. 1056).— Excellent writing and printing papers, bank-note paper, with superior water-mark; glazing-boards of good qua-

hty; and carton-pierre, for roofing.

M. Wuttio, of Pulverkrug, Frankfort-on-the-Oder (1 Zollv., p. 1056).—Tinted printing-papers of ordinary

good colour, and well sized.

quality.
M. C. A. Kocz, Gladbach (1 Zollv., 329, p. 1069).—
Samples of excellent plate, writing, and printing papers;

MM, Horsen and Son, Duren (1 Zollv., 392, p. 1072).

MM, Horszert and Son, Daren (1 Zoltv., 392, p. 1672). – Specimens of writing and printing papers; well-made coloured post papers, columned tissues—black and rose colour, bright and good.
M. Scriëll, and Duren (1 Zollv., 393, p. 1672). – Laid writing-papers and printing-papers of fair quality.
L. Piterre, at Dillengen (1 Zollv., 394, p. 1072). —

Writing-papers of excellent qualities and good colnur, but rather too soft sized.

M. Fischers, of Bautzen (3 Zollv., 168, p. 1112).— Printing, plate, lithographic, and writing papers, of excellent qualities.

MM. RAUCH BROTHERS, of Wortenburg (4 Zollv., 44, p. 1117).—Writing-papers of superior quality; thin pelare, well made and hard sized; veneered paper, blotting on one side, the other sized for writing.

MM. SCHARUFFELEN, of Heilbronn (4" Zolly, p. 1117), displayed a large assortment of well-made and good papers of every description, thin pelare, or thin post writing-paper, of good colour, well sized and clean, the folio ream 11s.; white tissues of good quality at 4s, 3d. or 5s, the ream; coloured tissues, bright tints, It's, the ream; fiue and well-made plate-paper, 8d. per pound; second unality plate 64d, per pound.

UNITED STATES OF AMERICA. About the year 1730, a paper-mill was erected in Massuchusetts, aud, about the same time, another in Pennsylvania; but prior to the American Revolution the progress in this important branch of manufacture was It appears, however, that before 1768, Christopher Leffingwell began to make paper at Norwich, in Connecticut, and received a boonty from the treasury of the colony of "twopence the quire on all good writing-paper that he made, and one penny the quire on all printing and common paper." At the end of the first year, in May 1770, he received the bonnty for 4,020 quires of writing-paper, and 10,500 quires of printing and coarser paper, after which the bounty was discontinued. Mesers, Watson and Ledyard set up a paper-mill in East Hartford, in the same colony; and this one mill, in 1776 and 1777, wholly supplied the press of Hartford, which published weekly above 8,000 newspapers, and also the greater part of the writingpaper used in Connecticut, as well as much of that used by the continental army. Shortly after this, paper-mills sprang up in every part of the country, and continued tu iucrease with extraordinary rapidity, as did also the number of newspapers and chesp books. Prior to 1810, number of newspapers and cheep cooks. Proc to 1810, the materials for paper-making were procured in the country; but, since that period, they have been largely imported from Europe. Nearly all the linen rags are imported, and are in great request in the United States for the purpose of mixing with the domestic cotton rags. It is estimated that the Italian rags used to contain about 80 per cent, of linco; but it is found that, as cotton for elothing is increasing in all parts of the world, the proportion of linen in the foreign rags is decreasing from 5 to 10 per cent, annually. This fact at first created some alarm; but it is ascertained that raw cotton, where it can be had on the spot for 3d, or 31d, per pound, answers as a very good substitute for linen. In the United States, the best qualities of writing paper contain from 30 to 50 per cent. of lineu rags. The import duty on rags is 5 per cent. of linen rags. The import duty on rags is 5 per cent. In the year ending June 1850, the quantity of rags

from the Hanse Towas; and 1,619,114 from Sicily. The remainder were chiefly from Turkey and Canada.

About 1820, machinery began to be imported into the United States from England and France; but, being found expensive, this was not much encouraged. It was not till about 1830, that Mesars. Phelps and Spafford, of Connorm 1830, that occases, riceips and continues, necticut, succeeded in manufacturing their machines, which are said to work well. They were much patronised, and they soon greatly enlarged their manufactory. Not long after Messrs. How and Goddard, of Worcester, Massachusetts, began to manufacture in great numbers machines for paper-making. At the present time, these two manufacturers produce nearly all the machines employed in the United States, and have besides begun to export them to South America and Mexico. The machines de hy these two firms are those known as the Fourdrinier Machines, with some modifications. A chesper kind, known as the Cylinder Machine, is used extensively for making the coarser and cheaper sorts of paper. These machines are also made in many other parts of the country,

imported into the United States was 20,696,875 lbs., which about one-half, or 10,277,337 lbs. were from Italy;

3,964,815 lbs. from Trieste and other Austrian ports;

1,621,692 from England, Scotland, and Ireland: 14.540,042

It is only since 1830 that any real impulse has been given to the manufacture of paper in the United States; and this is owing, not more to the introduction of machinery than to the great changes in the mode of manufacture, as well as in the raw materials. Various articles are now extensively used which were not thought of before the introduction of chlorine and other means of of paper from Belgium, France, and other countries. The

cleansing and bleaching. Old junk, rope, hemp, tow, bugging, raw cotton, cotton waste, coloured or filthy rags, Ac., are now extensively used even for superior papers. These materials, which were previously only used in the making of coarser papers, have risen 300 per cent, in value; in the United States, they are particularly useful, and consequently in great demand, where no linen is produced for mixing with, and importing streagth to, the cotton materials.

Since the beginning of the present century, the quantity of noner imported into the I nited States has been constantly decreasing, so that at the present day the proportion of foreign paper is only between two and three per cent, on the whole amount consumed. The paper imported is now almost exclusively of the superior qualities of writing and fancy papers, and is chiefly brought from Eagland and France, each country exporting about equal quantities. Belgium and Italy also contribute a portion. The import duty on all kinds of paper is 30 per ceat, ad valorese, There is no excise or stamp duty.

The Reporters regret that they have been unable to obtain from the United States the statistics of papermaking, which were so fully collected for the Ceasus of 1850, but which have not yet been published. We are, however, officially informed, that the number of engines and paper-mills have recently very rapidly increased, especially in the southern and western States. It is estimated that the cost of manufacturing paper at the present day, with all the improvements in machinery, and the increase in the variety of the raw materials, when compared with the old process and materials, is reduced fully 800 per cent. Hence the old-fashioned mode of making hand-made or laid paper is almost entirely abandoned in the United States, there being now only two mills of any note engaged in its manufacture. Even

two mils of any note engaged in its manuficiare. Even these only make appear (particulars ords, such as bank-note paper, letter, deed, parchinent, and such others as require great starceght and firmase, and the coasequent demand for new spapers and cheep literature, has readered demand for new spapers and cheep literature, has readered the United States the country within, it is said, economics more paper per head for its population than any other. But the great stain of the manuficturer in rather at cheapness than excellence in quality, though within the last five years improvements in the strength and quality of paper have been made. Recently, the fuish of writing and printing papers has been much improved by the introduction of iron and paper calcuders.

PAPER-MARING-AUSTRIA.

The principal mills are in Lombardy, Lower Austria, and Bohemia; there are also some in Venice, and in the Tyrol. Lower Austria contains the most extensive mills. The whole amount of paper produced per annum is now stated to be 650,000 cwts., 250,000 cwts, being common writing, and 60,000 cwts. fine paper; 150,000 ewts. printing, 100,000 cwts, packing, and 60,000 cwts. paper of other descriptions. Steam-power is applied in a few instances, but the mills are chiefly driven by water-power; three-fifths of the whole produce is by vat-mills, and two three-fifths of the whole produce is by vat-nulls, and two-fifths by machines. On a population of 38,096,008, it is stated that three pounds ut linen rags are produced per bend. There are, besides, quantities of of lorge, &c, used for paper-making. According to Messrs. Deraire and Mayer of Amentar, Fresch Commissioners at the Austrian Exhibition of 1845, the number of vata 540; machines in that Sates was 40, the number of vata 540; producing nearly 314,000 quintals (15,011 tons) of paper valued at 20,500,000 francs, being an average of 61d. per lb. The number of persons emplayed was 12,000, esides rag-sorters.

The number of machines is now 49, and 900 vats. Austria exports paper to the amount of 150,000/, per

PAPER-MAKING-DENMARK.

In Denmark there are six machines, besides one in Holstein, and 20 vats, producing altogether about 1,312 tons per year. In 1847, Denmark imported about 300 tous

TI

first paper-mill was established at Predericsburg, by order of Christian III., and the first machine for making paper was made by Messes, Donkin, and put up for Mr. J. C. Drewsen, in 1826,

PAPER-MAKING-SWEDEN.

In Sweden there are five paper-mills, employing seven machines, and eight vat-mill

PAPER-MAKING-SPAIN.

In Spain there are 17 machines: 1 in Old Castile, 2 in Valencia, 3 in New Castile, 1 in Estramadura, 2 in Catalosia, 3 is Arrazon, 1 in Audalsia, 3 in Gaijusces, and 1 in Nonane. The principal unith are at Burgos: at Resectifia, near Madrid; at Candedaria, open Begor; and 1 in Nonane. de Coppellades, near Parcelona. The machines have been imported from England, France, and Belginm; the first was established near Manzanares, in La Mancha, Don Thomas Jordan, There are also 250 vats, whole produce is 4,741 tons yearly. Of 3,400,000 kilogrammes of paper made in Spain, Catalonia produces 700,000 reans. The weight of mgs used in his province 7100,000 reans, is said to be 16.071 tous yearly. One hundred and forty thousand reams of paper were exported from Spain in 1848, to the following countries: -- to Cuba, 94,680 reams; to Chili, 16,000 reams; to Porto Rico, 10,000 reams; to other couotries, 20,000 reams.

PAPER MAKING - NETBERLANDS.

The importation of paper in the Netherlands, in 1847, was 219 tons, valued at 17,919 florins, chiefly from Belgium and the Zollverin. The importation of rags was 700 list, only. The exportation of paper, in the same year was 148 tone; its principal destination was Java. The expertation of rags was only 1,200 pounds weight.

PAPER-MAKING-SARDINIA, Triscant,

In the kingdom of Surdinia there are 12 paper-machines and 60 yats. The first machine was established at Horgo and 60 vats. The first macrines was estimated at horge Sesia for Mr. Molino. In 1848, the paper produced, none of which was experted, amounted in value to 6,000,000 florins; whilst in 1846, 1,178 tons of paper was exported from Genon to Mexico, Spain, and the Brazils.

In Tuscuny there are 20 paper-mills, and two Donkin machines, at the mill near Florence. In 1848, the exportation of rags and paper from Leghorn amounted to (3),(10) lbs.—about half to Eugland, and the other half to the United States.

PAPER-MAKING-HAMBURGH

The importation of paper in Hamburgh, in 1848, was of the estimated value of 1.288,000 france (51.250L)

PAPER-MAKING-SWITZERLAND

In Switzerland there are 26 machines and 40 vat-mills, producing together 11,507 tons annually. The men's wages are 90 centimes per day (about 8\frac{1}{2}d.), and the women 60 centimes (5\frac{1}{2}d.). No paper is exported.

PAPER-MAKING-SAXONY.

In the kingdom of Saxony, in 1847, there were 66 per-mills, with 6 machines, employing 992 persons. The exports and imports are trifling.

PAPER-MAKING-ITALY. In Italy, Lombardo-Venetian Kingdom, six machines are distributed among four mills,

PAPER MARING-SICILY.

In the kingdom of the Two Sicilies there are 12 paper-In 1827, MM. Firmin Didot Brothers and Lefevre established the first machine, under a potent of importation in the Mill of Fibrène (Isola di Sora). The number of persons employed is 1,200. There are about 12 vats, employing 300 persons. The whole produce amounts to 306 tons annually, and paper is exported to Sicily, Rome, Leghorn, Malta, the Ionian Isles, and

PAPER MAKING-ROMAN STATES.

In the Roman States there are three muchines; n Anatrells, at Fibre, and in the neighbourhood of

In Turkey there is one mill at Smyrns, and one papermachine, besides one vat-mill at Constantinople,

PAPER MAKING-TURKET. PAPER MAKING-EGYPT.

In Egypt, one vat-mill at Bonkae, near Cairo,

IV. PLAYING-CARDS.

The country in which playing-eards were invented has never been ascertained with any certainty, neither are we sequainted with the precise time of their introduction into Europe. Namerous speculative opinions have been put forth in order to prove that the art of wood-engraving originated from the manufacture of playing eards, it being supposed that the outlines of the figures or court-cards were cut on wood, and that from this was obtained the first idea of wood-engraving. The most ancient cards we have seen appear to us to have been stencilled, and this method seems to have been employed for the outline of the figures, as well as for the filling in of the different colours; therefore, as stencilling, was probably known long before wood-engraving, we are inclined to believe that the figures were not taken from wood-engravings until at a later period, as an improvement on the former mode. Some eard-makers of the present day manage steucilling with great skill, and the method is a favourite one, as it leaves no impression to show through on the back of the card, a fault sometimes difficult to avoid in white-backed playing-cards, when the outline has been printed on the card-hoard with a printing-press.

The cards mentioned as the oldest eards we have seen

belonged formerly to Mr. Tutet, who has written the

* A playing-eard stencil is a sheet of strong paper, covered with several layers of oil paint on both sides, and kept for a long time until thoroughly well seasoned, when the form of any figure required is exercilly cut out so as to leave sharp edges. The colouring matter, mixed with paste, is of any figure required is carefully cut out to 64 to believe sharp edges. The colouring matter, mixed with parte, is brushed over with a large circular brush, and cuters into the cut-out parts of the stencil, and thus imparts the design to the card-board placed under it. If this operation is skil-fally performed, much better and sharper outlines are obtained than wantid be generally supposed. Wont of the obtained than wantd be generally supposed. Most of the card manufacturers still continue this mode of painting the pips of playing-eards, as well as the filling in of the outlines of the figures, which are cut on pear-free weed. The manner of taking the impression of the outline of the figures was done by rubbsing, satil some few years ago, en Mr. Creswick first employed a press for the purpose,

following remarks on one of the fly-leaves of the volume in which they are collected; -- "The ancient cards" in " this volume, with others, duplicate, and the drawings in " the second volume, were purchased by me out of the " collection of Dr. Stukeley; the drawings were produced by the Doctor on the 9th of November 1720, to the "Society of Antiquaries, observing that the cards had "been given him by Thomas Rawlinson, Esq., being two "pieces of the cover of an old book, supposed to be "'Claudian,' printed before 1300; and then there was a "leaf or two of an old edition of Erasmus's Adages, "pasted between the layers of the cards, which being inid stratum upon stratum, composed two pasteboards, and made the cover of the book. The Doctor took the pains to separate the cards, out of which I have chosen a complete pack, and the better to preserve so singular " a curiosity, have bad it bound, together with the draw-" ines, and some modern French cards. It is observable "in the assient eards that there are no sees nor queens;
"but instead of the latter, are knights," The marks of
the suits are hearts, bells, bones, and acorns, and the conrt-cards are the king, knight, and knave. The size is 3 inches long by 2\frac{3}{2} inches wide. They are very rudely coloured. The figures on the French card above mentioned are the same as those still preferred in this country.

It is curious to observe that while the honours of modern French cards have undergone a complete change, those preferred in England retain the costumes and outlines of the oldest French cards, every attempt made to modernize the English court-cards having invariably failed. Some vears ago Messra. De La Rue introduced some improvements, and endeavoured to induce the public to adopt a more modern and defined costume in the court-cards, but they were compelled to abandon the attempt, and return to the old style, after having incurred heavy losses in their endeavours to create a more elegant taste.

In 1392 or 1393, there is the following entry in the accounts of Papara, treasure to Charles VI, of France, that monarch having loat bis reason in 1392:—"Given to Jacquemin Gringsouser, painter, for three packs of cards, git and coburrd, fifty-six sols of Paris." The tenor of this passage seems to imply that cards were already known, therefore it is highly improbable that Gringsonneur was the inventor, as has been asserted.

It is not known when the manufacture of playing-cards was established in England. As early as 1463 there were card-makers in this country, the importation of playingcards having been probibited by Act of Parliament in that year, as injurious to the interests of native manufacturers. No cards of English manufacture, of so early a date, have, bowever, been discovered.

The Abbe Rives aeerlbes the investion of playingcards to the Spaniards before 1332. Mr. Anstes conjectures that cards were known at the end of the birteenth century. They appear to have been known to the Italians in 1378, for Covellano states that the game of cards was brought into Viterbo, from the country of the Saraceas.

brought into Viterbo, from the country of the Saraceus, in that year.

In 1397, the labouring classes of Paris were forbidden

In 1975, we assume the plant of the plant in China at the plant cards on working days.

Playing-cards appear to have been known in China at an early period. It is said that they were invented in the reign of Leun-ho (1120), and were common in 1131. They are called che-pae, which signifies paper-ticket. The Chinese cards in the Eabhittion measured 24 inches

long by I linch in width.

In the Mussem of the Royal Asiasis Society there are
there packs of Hindonian cards; they are circular, and
there packs of Hindonian cards; they are circular, and
all properties of the Control of the Control
I linches. They appear to be made with carona. In

and opinions of the people. They coincide with the carliest Europeau cards in having no queen, the two court-cards being a king and his uninster or attendant, and the suits being distinguished by the colour as well as by the form af the mark or emblem.

Early in the fifteenth country card-making appears to have become a regular turde in Germany. Nursuelecpara, and Ulm were the chief towns for the manfacture of playing-cards. Besides applying the home facture of playing-cards. Besides applying the home stear of playing-cards. Besides applying the home ware; and at the present day much karper quantition of earls are exported from Germany than from any other country. Their desapones is, in odost, the principal tower made in England, although some are well under since they have adopted the method of printing the play since they have adopted the method of printing the play

and honoisers, as patiented in England in 1822.
At an early period the Netherlands seen to have been At an early period the Netherlands seen to have been the new period of the Netherlands and the Netherlands are not states that the longith Ind I a doven pecks for severe sitters. From a passage in Archanis Toxophinias, 1545, eards were then about twopreue per peck. This may appear of the new period of the Netherlands and two periods are not seen in the Netherlands and the Netherlands are not be longith for half-acrown a dozen in Hamburgh; and could be produced in this country and sold at these could be produced in this country and sold at these

We doubt whether so large a quantity as 40,000 reams

of Genoa paper was ever consumed in manufacturing playing-cards; if so, the sale must have been far greater than within the last 50 or 60 years, for that quantity of paper would have produced 5,000,000 packs of cards, whereas the amount was only 507,672 packs for the home and export trade in 1851. And as five or six card-makers supply the demand, it appears doubtful whether so large n number as a hundred masters could ever have obtained n living by the trade. Genoa paper was preferred by card-makers up to a late period, for its silkines, for its power of receiving the colour freely, and for toking the flist or glazing better than the larsh Eaglish paper. At present there may be a few reams still consumed by the old-fashioned makers; but the hulk of the paper is now made here, cards being almost all glazed by passing them between copper-plates through rollers, instead of glazing

them with a flint, as formerly. In the early part of the reign of George III. eard-Diving was very prevalent.
Until lately the importation of cards was prohibited

in Russia, where the manufacture of cards is a royal monopoly. The whole income derived from their sale is applied towards the maintenance of the Foundling Hospital. The manufacture of playing-eards is carried on, ou a very large scale, at Alexandrotiski, near St. Peters-burgh. The machinery applied to the manufacture of cards in the Imperial Manufactory is the invention of Mr. Applegath, and is under the direction of General Wilson. All the modern improvements for the manufacture of eards are to be found in that establishment, many having been furnished by Mr. De La Rue. His patent process was adopted for a superior description of cards many years since. The cards printed at Applecath's machine are in water-colonra; and although upwards of 14,000 packs are manufactured daily, the supply is not equal to the demand. The best Russian playing-cards are excellent, surpassing most continental cards in the glaze and all the essential qualities of good eards,

The demand for playing-eards has not kept pace with the increased population of this country; the duty of one shilling per pack neperating, with other circumstances, such as musical evenings, reading societies, &c., against

their greater use.

No person is allowed to manufacture playing-eards in this country except in the cities of Lordon and Westminster, and in the city of Dublin, in Ireland. Their manufacture is prohibited in Scotland. The duty is npwards of two hundred per cent, on the cost of manufacture, besides the dety on paper, which amounts to about 6d, on a dozen packs

In consequence of the re-issue of second-hand playingcards being allowed, forged aces, with the London makers names, have been introduced from abroad, and used for spurious cards, which are sold for second-hand, thus causing detriment to the English manufacturer and loss to the revenue. The permission to re-issue second-hand cards seems to have been retained in deference to those hy whum cluh-houses are supplied, the eards when nnee played with, becoming the perquisites of the servants, who obtain a certain price from the original veudor, by whom they are again sold. This opens the door for the contraband cards with forged aces, and is andoubtedly a grievance that Government ought to remove. If the duty were reduced from one shilling to three pence per pack, it would put an end to smuggling, forgery, and perjury, as regards cards; the sale would increase, a larger quantity of paper would be consumed, and employment given to a number of extra hands. The duty and export aces are printed at Somerset

* Cut-corner cards are the waste of card-makers, and are Cut-torner cards are the waste of card-maxers, and are not sillowed to be sold in regular packs, although they may be sold as waste, provided half an inch be cut oft one corner. The wording of the Act of Parliament relative to this sub-ject is so imperfect, that for two or three years cat-corner earls were regularly manufactured and sold; but the Com-missioners of Stamps and Taxes declared the sale illiegal. and took proceedings for certain penaltics against the retailers. There are still manufacturers who sell these lliegal cut-corner cards, to the injury of the fair trader, notwithstanding the threat of heavy penalties.

House on paper furnished by the card-makers, who have also to pay thirty pounds for every ace-plate, eugraved by Mesers. Perkins and Co., and sent by them to the Inland Revenue Office. If the ace-plats, on which there are twenty aces, be engraved on steel, it will last for a considerable time, but it is netwithstanding a heavy charge on the manufacturer of playing eards, as two different news are required, one for the home trade, the other for expor-Every card manufacturer is required to give two tation securities in 500f, each before a licence can be obtained. When aces are wanted by the card-maker, a requisition is sent to Somerset House, and a ream, containing 9,600, is usually drawn at one time. An officer is sent round to is usually drawn at one time. An officer is sent round to the different card-makers with seals, one of which is affixed to each pack required for Immediate sale. According to the number of scals furnished to each maker by the officer, the amount of duty of is, per pack must be paid on the first of each month. The aces remain in stock at the manufacturer's, the quantity in hand being ascertained by officers sent from time to time to inspect these. Should any deficiency be found, the duty must be paid on such desciency, and the manufacturer is called to account for the irregularity. When playing-cards are required for exportation, the manufacturer has to enter o a heavy bond, with security, to insure the bone fide landing of the eards at the port named in such bond, and a drawback of three halfpence per pound is allowed on all cards exported; but it often happens that the expense of the bond for small parcels is such as to make it a matter of indifference whether the drawback be obtained or not; and it certainly checks the sale of cards for exportation, for many persons would buy two or three dozen, when they do not wish to take grosses, to form an assortment af

stationery for exportation.

The amount of duty paid on playing eards in 1850 was 11.782l. 10s., sterling. being on 235,650 packs. The number exported, on which there was no duty, amounted in the same year to 329,888 packs, In the last year, 1851, there was a diminution of duty-

paid cards, as well as exports. The number of duty cards sold was 226,576, being 9,000 less than in 1850, and 281,106 packs for exports, being 48,782 packs less than in 1850,

The general mode of painting playing-cards is by sten-cilling with water-colours mixed with paste. The eardcilling with water-colours mixed with paste. Inc earu-board used in England consists of foor sheets of paper; two strong sheets of cartridge are first pasted for the inside of the board: they are hung up to dry, well present, and afterwards covered on each side with a sheet of which should be strong and well sized. The ontlines of the honours, as well as the ornamental backs, are printed with a letter-printing press. The pips are stencilled, 20 cards being the usual quantity on a sheet of foolscap. They are packed in what is technically called works; each work should yield 16 dozen and 8 packs of cards. They are well dried and aired, and then rubbed over with Castila scap, that the flint with which they are over with Cabin soup, may the min with when any new glazed may pass smoothly new without tearing the card-board. The operation of glasing with a flint is tedious, and causes much waste. When glazed, they are taken to the eutter, and from him to the women-sorters; they are are fully looked over, all defective cards being put aside for a cheaper description. All the picked cards are laid at what is called the head of the table, and constitute those denominated "Mogula" (best quality); the seconds, or slightly defective, come next, and are called "Harrys: the last and most defective are the "Highlanders work of 16 dozen that turns out well should yield the following proportions: from 8 tn 10 dozen of Moguls, 3 or 4 dozen Harrys, and the remainder Highlanders. They are put in wrappers, with a thread tied round each pack. sealed by a revenue afficer when required, and put up in parcels of six packs, which are called sixaines." There was little or no improvement in the manufacture

* It is a curious fact that the technical terms used in the workshops of playing card-manufacturers in this country are Frinch words, such as sizess (sixaines), brief, brif (short), &c, &c.: this seems to imply that practical card-making was introduced by the French into England. of playing-each until 1932, when Nr. De La Rue abtathené a patient for erariai improveneus, which consisted in aubstituting printing with oil colours, in lithography or letter-poss, from wood or metal blocks, and using a imperior description of quick-drying printingital, not lable to set-off in glatting. By this process a little, and that the set-off in glatting. By this process as more vivid, and the backs better eranamented thus could be effected by steediling with water-colours. The patient node of manifecturing playing-cards has been ohoped by many of the German manifecturer, and by the

Insperial Government of Bussia.

In his work on playing-cards, Mr. Chatto says, that
"no other game was ever so generally played by people
from the game was ever so generally played by people
from the game was ever so generally played by people
as extensively diffused as the use of tobacco, and is certailly indulged in by a greater variety of persona."

VIII, FANCY STATIONERY, &c.

It is almost impossible to enumerate the various descriptions of articles belonging to this class of goods. comprise albums, sersp-books, portfolios, musie-books, manuscript-books, writing-desks, cabinets, envelope-case portefeuilles, pocket-books, metallie memorandum-books, card-cases, blotting-books, lace-papers, gold printed papers, valentines, embossed boards, wedding envelopes, gold and silver medallions, fancy wafers, porte-monnaies, and numberless similar articles. There were several English and foreign contributors of fancy stationery, which will be

noticed under the following heads:-LACE-PAPERS.-This is a description of pierced paper and cardboard in initation of lace, the improved manu-facture of which took place in Eugland about 1831, Long before this period this pierced lace-papers had been made in France, chiefly for ornamenting fruit packed in card-board loxes. This particular description of thin perforated papers continues to be made for ornaments, such as lamp-shades, of which M. DEVRANCE, jun., 257 Rue St. Denis (1188, p. 1234), and M. ARRAULT, 136 Rue St. Denis (9, p. 1170), contributed numerous fine specimens; and for borders to mount small religious engravings, of which Madame Boyasse, 9 Kue du Palais de Bourbon, St. Sulpice (1102, p. 1230), exhibited some pretty varieties, carefully and neutly got up. The mode of perforating thick paper and card-board by machinery was first applied by M. Mare La Kiviere, a Swiss watchmaker, who obtained a patent above twenty years ago, for perforating zinc and other metallic plates, and established a manufactory at Hackney, near London, Mr. De La Rue having been invited to see this manufactory, suggested its application to paper and cardboard, and entered into arrangements with M. La Rivière to carry out this beautiful and novel paper ornament. Very large quantities of perforated eard-boards have been, and still continue to be, exported. They are used for embroidering on with silk and coloured beads. Another and more beautiful imitation of lace is obtained by a process now extensively in use, which was invented by Mr. Addenbrook, of London, and applied to the lace bordering of note and other paper. Some specimens, applied to pretty valentines, were exhibited by Mrs. Hansa (17, p. 537) and hy Mr. Mosman (204, p. 832), and for

(p. 1234), and M. Abrault of Paris (p. 1170), exhibited
various specimens of well-perforated fancy and letter

FANCY PAPERS,-These consist of numerous varieties of papers, printed in gold, silver, and colours; some by lithography, ehromolishography, surface printing, block printing, in the manner of calico printing, from woven wire, as patented by Mr. De La Rue, and also of papers covered over with real gold and silver, and imitation gold and brunze, embossed or grained by means of engraved rollers, dies, and plates, of varnished papers to imitate morocco, and numerous other descriptions. They are used for the card-board boxes now so generally adopted for packing goods, for wrapping and orm-menting superior fabrics, and for many other purposes, There were several English and foreign exhibitors: the There were several English and foreign exhibitors: the principal wee M. Andrash Cr. pp. 1169, 1170, M. Gensser (260, p. 1184), and Mr. Vardundorfera, of Paris (172, p. 1213); M. A. Dubart, of Archifesburg, Ibarari (2 Zolfe, 68, p. 1101); M. Firsten (6 Zolfe, 48, p. 1184); J. B. Weiner (2 Zolfe, 48, p. 1104); M. Statten (2 Zolfe, 48, p. 1105); M. E. Weiner (2 Zolfe, 44, p. 1128); and Weiner Buschman, of Golbech (6 Zolfe, 48, p. 1128); M. E. Pieritsen, of Golbech (1 Zolfe, 266, p. 1053); M. E. Montac, of Berlin (1 Zolly., 249, p. 1061); and Messrs. Dr. La Rue and Co., of London (pp. 541-543), at whose stall pattern-books containing many hundred specimens

of chaste and elegant designs, were exhibited.

Plain Surface Coloured Papers,—This description of paper is coloured by means of brushes similar to those employed by paper-stainers for decorating houses, but requires more care in laying on, smoothing, and finishing, as well as colours of a finer description. It is used by bookhinders, printers, button-makers, confectioners, and numerous other branches of trade, giving employment to hundreds of men, women, and children. The contributors were Messrs. DE La Rue and Co., who displayed a beautiful assortment of coloured papers arranged systematically on the plan of Chevreuil, to show the effects of constructing colours; these papers were placed in two rows, about one foot distant, so that as the observer moved they shifted their apparent position with regard to each other, a number of different effects of contrast being thus

Messrs, J. and R. Newbenky, Hemlock Street, Carey Street (148, p. 546), had well-manufactured gold and coloured papers in great variety.

ENAMELLED PAPERS.-The advance of chemistry as applied to colour-making is exemplified in the beautiful appress to consur-maxing is exemptated in the beautiful white glossy colour with which enamelied appers are prepared. Artificial sulphate of barytes, made from the mative earhonate, was for many years manufestured and sold by Mr. Hume, of Long Acre, at one guinea per llb., under the name of permonent white, and used by water-colour painters, who prized it for its unchangeable qualities. It was subsequently applied by Mr. De La Rue to enamelling paper, when the price was reduced from one so examemag paper, when the price was reduced from one guinen to sizence per pond. It is exclusively used by paper-stainers, both in England and France, for the ground of their fine satin paper-hangings. Enamelled, paper is used for printing in gold, boune, and other metals, and from its deficate and glossy surface it is also used for wrapping superior articles of manufacture. There is another and more expensive description of ensuel colour, with which the highly glazed invitation and visiting cards are manafectured. These cards were introduced in England about twenty years since, by Mr. troduced in England about twenty years since, by Mr. Sturz, on his return from Frankfort, in which city they were first made. Mr. Sturz obtained a patent for improvements in copper-plate printing, and described the material he need as the "best and purest while leaf." This proved fatal to his patent, for having obtained an injunction against Messrs. De La Rue, who manufactured cuamed cards with barytes, Lord Chancellor Lyndhurst held that the specification was too vague, and that the commercial name should have been given, namely, "Kremnitz white lead." The injunction was dissolved, with costs, and the manufacture of enamel eards thrown

open.
The enamelled boards, eards, and paper of M. Bondox, of Paris (6.3, p. 1174), were of excellent quality.
Zolleveria, M. Semanans, or Merceburg. Zoller, Zolleveria, M. Semanans, or Merceburg. Zoller, Zolleveria, Semanans, Cambridge and Joach of great boanty. M. Vitt. and Co., of Stuttard (4 Zoller, 45, p. 1117), had enamelled card-boards of excellent quality: and M. Wersen, in Offenboch, Grand Dechy of Hesse (Zoller, 43, p. 1128), exhibited enamelled

conti-dounts of average quality.

SEELING and BECKER (6 Zollv., 69, p. 1129).

ALBUMS.—The manufacture of albums form an important item of fancy stationery, and admits of every variety of ornamental display in the bindings, from the cheapest to the most costly and claborate descriptions M. Hansxiert, at Vienna (376, p. 1029), contributed three specimens, which were in the Queen's bookcase in M. Leinsario Austrian rooms. One in dark-blue velvet, with silver mountings; me in green, with delicately with silver mountings; me in green, with delicately pierced work in ivory; and ose in tortoiseshell, with gilt and silver inlaid embellishments. These very beautiful covers are from designs by Professor Racener, and are of superinr workmanship. The other exhibitors from Vienna wero M. Raus (369, p. 1028), M. H. F. MÜLLER (372, p. 1028), and M. NEUMANN (373, p. 1028), whn all had albums deserving commendation. From Berlin, M. p. 1028), and M. AKDMANN (373, p. 1028), who all had albums descring commendation. From Berlin, M. LAISGOANO (1 Zollv., 149, p. 1055) exhibited an album in velvet, nearly gilt. M. GERHART (1 Zollv., 1243, p. 1061), M. SCHOENING (1 Zollv., 154, p. 1057), and M. KHOMANN and SON (1 Zollv., 154, p. 1056) had speciates deserving mention, M. W. BRIBBER, of Kothea (1 Zollv.). 748, p. 1091), had an album of coloured drawing-papers and a blotting-paper case, beautifully worked in velvet and gold. From Belgium, M. PARLYT (278, p. 1159) displayed Bevort's Album de Pomologie, containing written and illustrated descriptions of the most remark-able fruits. From Switzerland, M. Spottscan, of Schaff hausen (253, p. 1282), an album of wood-ents, the designs by Swiss artists. From France, M. Gonersov, of Paris (1722, p. 1258), exhibited a beautiful alhum of the Society of Literary Men, containing a collection of drawings and untographs, and M. Pillaur had an album with nearly embroidered covers.

In the English Department Mesers, De LA Rue and Co.

In the English Department Messrs. Dr. La. Ruz and Co., 6-430 jishpayed an ansortment of albums in carved wood and in morocco, Russin lenther, and veivet hindings. The tooling and gading were produced by the combination of four hundred tools, engraved in a new style expressly for the purpose from designs by Mr. Owen

 The English exports of stationery in 1831 amounted to 401,304. This includes numerous small articles of manufactured leather goods. men; in Leeds, 9 men; in Halifax, 2 men; in Bradford, 3 men; in Dublin, 5 men; in Bristol, 3 men; and in Bath, 2 men. The principal English manufacturers in Class XVII, were Messrs. Dr. La Rux and Co. (pp. 541— 543), who contributed every variety of pocket-books, envelope-cases, card-cases, writing-desks in leather, velvet, and oak, a did sketch-books and drawing-blocks, despatch-boxes, wallets, blotting-cases, indelible diaries, and numerous other articles belonging to the trade of pocket-book manufacturers. Mr. Macui (45, p. 791), in Class XXIX., contributed a large and elegant variety of dressing-cases, blotting-cases, and every description of goods inpertaining to this branch. Mr. Shitti, Class X., had a case in the Main Avenue filled with a complete and elegant assortment of leather goods, consisting of desks, envelope-cases, blotting-cases, &c. &c. Mrs. Scherasinges, of the Old Jewry, had some pocket-books, letterclins, &c.

France,-Widow Schloss and BROTHER (No. 1480, p. 1247), whose manufactory in Paris is replete with presses, tools, and other appliances necessary for the production of porte-monanies and similar leather articles, had a splendid assortment of well-manufactured goods in their specialité.

CARTONNAGE-PAPER BOXES.—It is only within a few years that manufacturers in this country have adopted the mode of packing their goods in paper boxes. There is now a very large quantity of boxes manufactured in England, and although generally inferior in point of elegance to those made to France, some sorts are cheaper in England, notwithstanding the very high paper duty of 14d. per lb.
They are made principally in London, Manchester, Birminglam, Nottingham, Leicester, and other manufacturing towns, and, in Belfast, giving employment to a large

number of hands.

In Paris four thousand persons are employed in the manufacture of paper boxes. The trade is divided into six distinct branches. The first comprises the most elaborately-finished and ornamental boxes, for the display of artificial flowers, rich velvets, ribbons, satins, silk trimmings, medals, miniatures, and corbeilles for wedding The second class consists of boxes and small ornaments for confectioners. The third description is ornaments for confectioners. The turn description is used for packing glasses, trinkets, and such goods as are sold at 25 sous (1s. 04d.) Boxes for perfumery, for fans, gloves, &c., constitute the fourth branch. The fifth is chiefly applied to the manufacture of boxes for countinghouses, and large hoxes for shawls and ribbons for exportation. The sixth and last comprises pill-boxes, wafer-boxes, and boxes for small wares. The Cartomerie portation. of Paris is superior to that of any other country, both as regards the nentuess of execution, and the light and regards the neutrons of execution, and the light and elegant style of ornamentation. There is also a descrip-tion of cartonserie manufactured at Bordeaux for fruitboxes. The principal exhibitors from Paris were Madame MAYERS and Mr. DOPTER. From England, Mr. TAYLOR, of Nottingham, had a stall in the Machinery Department, where he exhibited a variety of paper boxes.

BLACK-LEAD PENCILS,-Plumbago (carburet of iron) is the substance known under the name of black-lend, although it contains no lead, the popular name having no nther foundation than the lead colour which it imparts when traced upon paper. Beckmann states that blacklead pencils were in use in 1565. The best plumbago is produced from the Cumberland mines. The pits are situated on the Borrowdale mountains, ten miles from the town of Keswick. The whole produce of these mines is sent up to London, where it is sold at an anction held once a month, at a house in Essex Street, Strand. produce of six weeks anuual working of these mines is said to be from 30,000d, to 40,000d.

Plumbago is found in the neighbourhood of Ronda, in Grenada, and near Malaga, in Spain, but it is hard and difficult to grind. The best substitute for Cumberland plambago is that of Hohemia and Bavaria. It is also found at Rhodez (Aveyron), France. As infe-rior kind of plambago is imported from Ceylon and Mexico. In 1822 the late Mr. Mordan patented the application of plumbugo in the form of very small cylinders, projecting from a cylindrical cone fitted to a pencil-case, which

soon became in general use, and of which there are now many inferior imitations. Mr. Brockendon, of London, has since patented a mode of compressing the dust of plumbago, imparting to it nearly the same firmness and quality as when in its original state from the Cumberland

The manufacture of black-lead pencils has been considerably improved within the last ten years. Partly by the purification of good plumbago, and partly by the admixture of other substances, good black-lead pencils are produced without Cumberland plumbago, at consider-ally reduced prices. The qualities necessary in a good lead peneil differ very much according to the purpose for which it is to be used; a deep black mark, combined with great softness, being required for some uses, and for others the greatest hardness, with the power of pressing lightly. The articles exhibited prove how completely manufacturers have met these requisitions, by the nu-

merous fine specimens in more or less elegant settings,

Among the best English makers who exhibited were Messrs. Banas, Soz, and Co., of Keswick (96, p. 544), who had specimens of pure Cumberland lend and composition used in the manufacture of black-lead pencils, specimens of the various stages of manufacture, from the raw material to the complete pencil, and pencils in various raw material to the complete pencil, and pesculs in various style of finish. Mr. Monran (58, p. 199a) exhibited combined mechanical appliances for the preparation of lead pencils. Mossrs, Wolff and Sox (68, p. 128) had specimens of pure Cumberland lead; specimens of com-pressed Cumberland lead; specimens of Cevion plumbago. as produced from the mine, and some prepared and compressed; specimens of Malaga plumbugo, as produced from the mines, and also some prepared and com-pressed. Messrs. Rowner and Son, of Rathbone Place Princed. Melers, помякт выи сол, от папасок запа-(Class I., No. 64, р. 128), Messrs. Впоокмам вид Langbon. of Great Russell Street (Class I., 64, р. 128), LANGIDON, OF Great Russell Street (Cass I., 64, p. 128), Mr. R. Anara, of Maryport (Class I., 66, p. 128), and Mesers. Referes and Sox (Class I., 66, p. 128), also ex-bibited black-lead peneils. Mr. Brockendon, of Queen Square (Class I., No. 65, p. 128), exhibited plumbago from Camberland, Ceylon, Davis' Straits, Spain, Bohemia,

Greenland, California, and France. France.-The well-known establishment of GILBERT and Co., in Giret (238, p. 1188), deserves mention. Sixty workmen, with an eight-horse steam-power engine,

are employed in this establishment.

Zellerrein.—The pencils exhibited by Messrs. A. W. Fann and Strin, of Nuremberg (2 Zelly., 81, p. 1102), Farix and Strin, of Nuremberg (2 Zollv., 81, p. 1102), were of the best description, and the prices extremely low. They employ upwards of 800 workmen. They export their peochs to Italy, Parix, Vienna, America, Russia, Great Britain, and other places, the demand better provided by the supplied of the places, and provided RIMBAC, and provided the provided provided by the provided RIMBAC, in Regerbourg (2 Zolly, 82, p. 1102), exhibited specimens of their pencils, well-known under the name of Reperabury pencils, fully maintaining their well-founded reputation. M. Birkwarn, of Naremberg 12 Zollv., 79, p. 1102), had some black-lead pencils of fair

Austria,-MM, L. and C. HARDMUTH had some speciens of pencils of excellent quality

The English exhibitors of black-lend pencils were not in Class XVII., and it was not until the Jary had nearly finished their labours that they were requested to exa-

finished their lations that they were requested to various these productions.

SEALING-WAX.—WAX appears to have been used in Europe for easiling since the earliest ages. It has been asserted that sealing-wax was invested by a Prench-man in 1640. Beckmann quotes that Francis Housean, but they have been asserted that the production of t his family, prepared scaling-wax from shell-lac, as he had seen it manufactured in India. By this article Rousseau is said to have gained 50,000 livres in a year. Mr. Jonns, known under the name of Jones, was the first manufacturer of sealing-wax in England. He had an apprentice about 1780, called Chanapante, who much improved sesling-wax, and became known at the beginning of the present century as a celebrated scaling-wax maker.
Messrs. Champante and Whitrow were long knuwn as

wholesale stationers and sealing-wax makers in Jewry Street, Aligate, even within the last 40 years. All fine wax was then called "Dutch wux," and although made in England, it was stamped with a Dutch brand. Some sorts are still called Dutch wax, but this name denotes sorts are statl entants Duten wax, out this same occurring an infrior description. Scaling-wax is composed of the best shell-like and Venice tarpentine; the red is coloured with vermilion, and the black with the best ivery-black. Other colours are obtained by mixing with it different metallic oxides. The wax used for the Great Scal of England is made up according to a recipe kept in the Lord Chancellor's office. It appears to be composed of a compound of oils and balsams, and has a whitish appearance. The wax of the Great Seal and Privy Seal of Scotland has been manufactured by Mr. Waterston, of Edinburgh, for many years. It is made from resin and bees'-wax, coloured with vermition. The Exchequer Seal is green. Seajs made of soft wax, like that now used for the purpose, do not last, nor does this soft wax yield so good and clear an impression as if it were made with the best shell-lac." There was, in a small case in the Portuguese Court at the Great Exhibition, some sealingwax bearing a close resemblance to that from ludia. Scaling-wax was common in Portugal about 1560, and is supposed to have found its way there from India. Neither the French nor the German scaling wax is so strong in shell-lac as the English. Camphor does not appear to have been added in the manufacture of scalingwax until the middle of the last century: there is only a small portion of camphor in the India wax. If camphor be used in the manufacture of wax, although it much improves the burning, it renders it unfit for use in fureign climates. Good impressions can be made with the fluest red wax at a temperature of 140° Fahrenheit, whilst 170° is required for Iudia wax. Charter wax, like that

of the Great Scal of Scotland, can be scaled at 118°. Shell-lac is bleached to a cream colour by chemical nus, and sealing-wax is made with it of a variety of icate shades. In the Great Exhibition the French delicate shades. and Belgian cases contained a variety in the most bea WATERSTON, of Edinburgh, exhibited the Charter wax, red and green, India and bottle-wax, and every variety of shell-lise wax, bleached, unbleached, embossed, and plain. The English manufacturers of scaling-wax have made great improvements within the last 15 years. The English vermilion being bright enables manufacturers of scaling-wax to impart great brilliancy to their wax. Messrs. Hydr, of Fleet Street, had some beautiful specimens in great variety. Mr. HENRY MORRELL, Fleet Street, exhibited various specimens illustrating the manufacture of scaling-wax, rough scaling-wax, sticks of scaling-wax moulded and partly polished, finished, and stamped; sealing-wax in packages and of various qualities. Messrs. Cookx and Sons, of Cannon Street, had specimens of coloured, embossed, and transparent scaling-wax, with various impressions. The East India Company with various impressions. The East Indea Company had some specimens of India wax.

France.—MM. Vincent and Tisserant. Rue Miebel-

le-Comte, Paris (730, p. 1215), exhibited specimens of scaling-wax of good quality. Belgium.—M. Zegelara (280, p. 1160) exhibited

various coloured sealing-wax. Portneyd .- M. MANOEL RODSIGUEZ LATA, of Lisbon (p. 1314), had some scaling-wax of different colours,

orely resembling Iudia wax.

Z. Horrein. - M. T. Manuel, Konn, of Main-Bernheim, Bavaria (49, p. 1100), exhibited specimens of sealing-wax. Most of these exhibitors were not in Class XVII.; the Jury had nearly completed their examination when they were requested to examine sealing-wax exhibited by contributors ont of their Class.

The Jury have awarded a Council Medal to the Impa-RIAL COURT AND GOVERNMENT PRINTING OFFICE OF VIENNA (Austria, 363, pp. 1025-1028), for their new processes in typography, galvano-plastic, and chemitypic printing: for the variety of their Oricutal types, and per-fect execution of the pusches, as well as for the general

excellence of the numerous specimens exhibited in stereotyping, electrotyping, printing, and bookbinding.*

Prize Medals are awarded to the following Exhibitors in the various departments of Class XVII.:-

ANGRAND, 59 Rue Mesluy, Paris (France, 7, pp. 1169-1170), for general excellence in ornamental, coloured, and faney papers.

ATRISSON, WILLIAM, dyer, Lamb's Passage, Finsbury, London (56, p. 541), for his superior finish of bookhinder's cloth. Banners and Co., bookbinders, Fleet Street, London (196, p. 550), for excellence in binding Bibles and Prayerbooks, and for the peatness with which every leaf of a

folio Bible is ornamented with blue edging.

Banks, B., engraver, 62 Rue Mazarin, Paris (France 40, p. 1173), for his superior engravings by Collas'

tracing machine. BESLEY, R., and Co., Fann Street, Aldersgate Street,

London (195, p. 550), for the variety, beauty, and origiuality of their types. BLANCHET BROTHERS and KLEBER, poper manufac-turers, Rives (Isère), (France, 1090, p. 1230), for general excellence in their white and coloured papers.

Boxe and Sox, Fleet Street, London (62, p. 541), for cheapness and excellence in cloth bookbinding. BROCKHAIN, F. A., printer and publisher, Leipzig (Saxouy, 178, p. 1112), for his collection of three hundred and fifty-six volumes, the whole printed at his

own establishment in the year 1850. BRADEUNT and Evans, printers, Whitefriars, Loudon (136, p. 545), for general excellence in various specimens

of printing.

Cattaut-Beliste, Novel De Tinan and Co., paper manufacturers, Angoulème (France, 788, p. 1218), for the good quality of various papers.

Caston and Co., type-founders, Chiswell Street, Finsbury, London (78, p. 543), for the beauty and great ety of well-finished types.

Crimto and Mixa, Turin, Sardinia (Sardinia, 89, p. 1305), for superior workmanship in a folio volume, the "History of Hautcombe Abbey," with woodents and "History of Hasteombe Abbey," with woodents and other borders, also for some printing materials. Classes, J., Frith Street, Soho, London (68, p. 541), for various specimens of bookbinding; the hand-tooling of which is well-executed, with great solidity in the forwarding. Some tree-markling on eall fresther is carried

to great perfection.

CLATE, J., printer, 7 Rue St. Benolt, Paris (France, 798, pp. 1218, 1219), for superior workmanship in wood-

eut and other surface printing.
Cnosa, G., 2 New Coventry Street, Leicester Square, London (88, p. 543), for a new mode of fastening the leaves of scrap-books without guards.

Cussons and Co., dyers, Bunhill Row, Finsbury, Lon-don (69, p. 541), for their bookbinders' cloth; the erimson and ultramarine blue are bright and beautiful, and show a marked advance within a few years in this ortant branch of manufacture. DEWDER, J., Collumpton, Devonshire (143, p. 546), for the excellence of his writing papers, and also for the

permanent dye of his blue papers for the use of starch mann facturers DERRIET, M., type-founder, 8 Bue Notre-Dame-des-Champs (185, p. 1183), for his improved music types and flourishes, and for the perfection of various founts

exhibited

* The following resolution was moved by M. Didot, seconded, and unanimously passed by the Jury, at the sit-ting of the 21st of June 1851.—

"That the following paragraph be inserted in their

"That the Jury regrets that the position of Mr. Dr.
La Rur, as a Juror, has not allowed this Jury to
recommend that the Council Medal be awarded to

recommend that the Council Medal be awarded to him, which in their upinion he so justive deserce, both as an inventor of acknowledged distinction, and for having exhibited a great number of spe-cimens of general stationery and playing earls, among which the Jury has specially noticed the papers of Mr. Richard Turner, of Chaff-ed, Kent."

DECANA, Il. L., printer, Berlin (Prussia, 148, p. 1056), for his Oriental and other types; for the excellence of his printing, as exemphiled in a large folio New Testament, and in the works of Frederick the Great, all of which are well got up, the paper, type, and ink, being

of the best quality.

Drawsan and Sons, Silkeborg, Jutland, Denmark (Deumark, 4, pp. 1355, 1356), for a specimen of creamhid writing-paper, well-glazed, in long lengths.

Desaosists, A., printer, Moulius (Allier), (France,

817, p. 1219), for general excellence, as exemplified in six volumes exhibited; a remarkable specimen of good printing, considering the disadvantages a printer labours under in a country town.

DODREAC, E., the Joint-Stock Paper-miking Company of the Marais and Ste. Matic Paper-bills, Jony, St. Moriu, Seuseet-Marue (France, 822, p. 1229); depte, 3 llue du Pont de Ledi, Paris; for the excellence of printing, writing, and drawing machine-unde papers. Downing, IL, Van Diemen's Land (Van Diemen's Land, 331 and 353, p. 999), for a specimen of Ta-manian printing, as shown in the Tasanasian Calcular and Tasmanian Journal.

DUPUNT, P., 55 liue de Grenelle-St.-Henoré, Paris (France, 181, p. 1182) for superior skill in producing fac-similes of old books, and for general excellence in printing.

Dezogrot, Messrs, Smyrna (Turkey), for excellence in writing-papers.
The East India Company (p. 917), for their valuable

collections of India paper, Enart Hauturners, paper manufacturers, Berlin Prussia, 145, p. 1056), for general excellence in papers, glazing-

boards, carton-pierre for rooting, and paper with watermarks for bank-notes. EGYPT, HIS HIGHNESS THE VICENOT OF (Egypt, 248, 374, pp. 14to, 14t1), for a collection of one hundred and saxty-five volumes of books, printed in the Arabie, Persian, and Turkish languages, at Boulae, near Cairo,

and likewise for a catalogue of all the books published in Evass, J. S., bookbinder, Berwick Street (8, p. 537), for the clean and superior figish of his binding in white

vellum, and the general excellence of the various specimens exhibited. Farea, A. W., pencil-maker, Stein, Bavaria (Pavaria, 81, p. 1102), for the perfection of his black-lead pencila, for sketching, engineering, and architectural purposes.

Fishira, J. H., Hoxton (10, p. 537), for a new and ingenious mode of printing from copper-plate in two colours at one operation, with a peculiar ink, which resists water, but is altered by the usual chemical re-agcuts, and which may be usefully applied to the printing

of bank-notes and cheques. Figories, V. and J., type-founders, West Street, Smith-field, Loudon, (124, p. 545), for the excellense and beauty of their types, and for the care bestowed in the finishing

of their types, and for the care bestowed in the limiting to insure correct justification. Fischus, C. F. A., paper-maker, Baulzen, Saxony (Saxony, 168, p. 1112), for the excellent quality of his plate, lithographic, printing, and writing papers; the engine-siring of the writing-papers is very superior. A specimen of a large machine-made millboard, I inch thick 3 feet while and 6, four hora-decree architecture. thick, 3 feet wide, and 6 feet long, deserves special

GAYMARD and GÉRAULT, 10 Rue Moutmorency, I (France, 518, p. 1203), for their specimen of ledger bind-The large ledger in rough calf contains no less than one thousand ruled leaves, is well bound, opens very freely, and is a specimen of excellent work.

freely, and is a specimen or excession wors.

Gilhers and Co., pecil-inakers, Givet, Ardennes
(France, 238, p. 1183), for the excellence of their pencils,

Gooss, I. L., and Sox, paper meanifacturers, Hay
(Litge), (Belgium, 284, p. 1160), for a harpe variety
of printing, arting, and drawing papers, in all of which great perfection is attained. Habencut, A., bookbinder, Vicuna (Austria, 376, p. 1029), for general excellence in bookbinding and in

porte-monnaies, and leather goods of a similar descrip-

HARDTMUTH, L. and C. pencil-makers, Vientia (Austria, 381, p. 1029), for the good quality of their pencils.

Hasseq, P. J., Mechlin (Belginm, 285, p. 1160), for his large collection of printed books, combining cheapness with good workmanship. His liturgies in red and black deserve notice,

Haase, G., and Sone, printers and type-founders, Pringue (Austria, 367, p. 1028), for the general excellence

of their types and printing. HAYDAY, JAMES, bookbinder, Little Queen Street, London (106, p. 544), for his superior workmanship, exemplified in the books exhibited by Messrs, CUNDALL

HEBBICK, J. K., stationer, New York (United States, HERBICK, J. A., SIRBORF, INCW TOTA (Unified Galler), 502, p. 1466), for his superior ruling of account-books. Hosto, B. C. and L., Zanadyk, Netherlands (Nether-lands, 59, 60), for specimens of superior parchiment, and

Howe, S. G., Boston, United States (United State 439, p. 1463), for superior characters for the blind, of an angular form, without capitals; this system is more simple than any hitherto attempted, and easier to dis-

tinguish by the touch. Hosen and Sons, paper manufacturers, Daren (Prassin, 392, p. 1072), for the ebeapness and perfection of their white and coloured writing and tissne papers, among which the black and rose-colour are of peculiar brightness, HTDE and Co., scaling-wax manufacturers, Fleet Street,

London (21, p. 557), for the general excellence of their wax, some of which is said not to soften under a temperature of 120' Fahrenheit, and is therefore adapted for hot countries, as at this temperature it still retains the seal impression. JOHNSON, WILLIAM, paper-maker, St. Mary Cray, Kent

(42a, p. 540), for the superior quality and finish of his writing papers. longitate and Venaton, Darmstadt, Grand Duchy of

Hesse (Hesse, 6, p. 1126), for letter-press relief coloured maps. The different minerals of each district are shown by appropriate colouring. (Medal awarded in Class I.)

Lawn, J., paper-maker, Newcastle-under-Lyne, Staffordshire (147, p. 546), for excellence in the manufacture

of pottery tissues.

Laboulave, C., and Co., type-founders, 50 Rue
Madame, Paris (France, 895, p. 1223), for great skill
exhibited in the finish of their printing types.

LEGRANN, MARCZLIN, type-founder, 99 Rue du Cherche-Midi, Paris (France, 584, p. 1206), for the general excellence of his types; for his specimen of cast-ing, wherein one hundred and forty letters are cast at once; for his collection of Chinese types; and for the beauty of various specimens exhibited. LACROIX BROTHERS, paper-makers, Angouleme, and

Rue Mazarin, Paris (France, 1636, p. 1255), for the great

Bue Mazaria, Paris (France, 1636, p. 1235), but no great perfection of their witing papers.

Lazaurros, J. and J., bookbinders, Brewer Street, London (24, p. 538), for specimens of good binding in various stages; for the perfection with which they make fact-similes of missing pages to valuable works; and the care and finish which are conspicuous in all they have exhibited.

Lawis, Mrs., Duke Street, St. James's (163, p. 547), for excellence in bookbinding. LORTIC, P. M., bookbinder, 199 Rue St. Honore, Paria

(France, 1652, p. 1256), for the taste and execution displayed in the finish of several works, among which a folio volume, "Ballus de Janus," in an illuminated style, deserves particular mention. The firances of the forwarding throughout the whole series of books exhibited by Mr. Lortic merits high praise.

MAURAN and VINCENT JOURNET, managers of the Joint Matham and Vincary Journal, managers of the Joint Stock Paper-Julking Company of the Souche, Voscer, and 5 Rue du Pont de Lodi, Paris (France, 377, p. 1195 and 619, p. 1207), for the general excellence of their printing papers, and more particularly for the parity of their filtering-paper for chemical purposes, hitherto a great desidera

great desideratum,

Manz and Co., Tours (France, 321, p. 1192), for the
extreme cheapuess and great variety of books printed,

bound, and published by them. Amongst others, "Le Paroissien Romain," 18mo, 636 pages, in Latin and French, neatly printed, with a vignetic border to every page, in boards, is published at "one shilling."

Mayes, Madame T. (France, 624, p. 1207), manufacturer of fancy ornaments for confectioners, 22 liue de

Incturer of Biney orininents for consecutorers, 22 fine or In Vieille Monnie, Paris, for general, excellence.

MILIANI, P., Rome (Romo, 12, p. 1285), for the high quality of his hand-made plate and writing papers.

MÖSETI and Co., Offenbach, Grand Ducby of Hesse (Grand Ducby of Hesse, 66, p. 1129), for general excellence in porte-monnaies, pocket-books, and dressing-

MONTOGLITER, paper manufacturers, Paris (France, 324, p. 1192), for the general excellence of their paper, and for their imitation of parebment, adapted, among a

> Associate Jurors. - Manyas, Lyons, France. SAMUEL SMITH, Bradford.

THE Jury of Class XVIII., in accordance with their instructions, report as follows on the various specimens of printed goods placed in the Eshibition, the whole of of printed goods placed in the Eshilution, the whole of which they have carefully and minutely examined. The productions of the English and Scotch printers came first nader their observation. Ireland has now only one or two small print-works: she had some rather extensive ones within the last twenty years, but during that time they have been gradually closed. He fore remarking on the present productions of the English and Scotch printers, the present productions of the Eaglish and Scotch printers, the Jury can hardly help referring to the changes in the trade within the last-named period, dating from the repeal, in the spring of 1831, of the very heavy duty on printed cottons. The entire production of the trade in England and Scotland (Ireland paid no duty for home-consumption) was then, as shown by Parliamentary returns, rather more than eight million pieces per annum The reduction of a duty amounting on the average to fifty per cent, gave an immediate impulse to the trade, and within ten years from that date it uppears that the production of Great Britain was doubled. Since that period no materials easist which afford sufficient data for an accurate account of its progress; but it is calculated that the trade, which in 1830 produced eight million produces a see thate, where is 10.00 produces eight million pieces per annum, now probably produces not less than twenty millions yearly. Great changes in style and taste would necessarily be consequent upon such an increase in quantity. Very great improvements have been effected quantity. Very great improvements have even entering in the material priated apost. The regularity and even-ness of fabric, in calicos made by the power-loom, of all qualities down to the very cheapest, give the English printer a fabric for the use of the middle classes, which pisces him decidedly above the competition of the whole world in this most essential branch of his trade.

world in this most essential trainen of its trade.

The language given to the trade, followed perhaps by cacess of supply and strong competition, caused a great reduction in price. To meet this, mediane-work was growerally substituted for block-prinning. The engraver was stimulated (here, too, machinery tent its add), chemiwas stimulated (here, too, machinery lent its aid), chemical discovery (English and foreign) was not wanting, and the result was a large and cheap supply, chiefy of fluc class plate-work, bentifully and exactly executed; or in ose, two, three, or four colours, in permanent madder-work, is well as in a larger number of colours,

printed at once in more showy and facitive steam-These changes led to the encouragement of a less showy taste than that for chints block productions, and to a preference for goods of a more elegant and quiet character, Some of the staple productions, such as the navy-blue

print, largely consumed for domestic wear throughout the country, almost entirely disappeared, being super-seded by the very general use of the purple madder It should be observed that at this date the English printer borrowed extensively from the style of his French competitors. The printers of the then called Swiss prints competitors. The priaters of the then called Swiss priats (really French goods, produced in Alsace) were unri-valled in their pink and purple machine work. These articles, even for years afterwards, were invitated successfully by a few only of the first-class English printers; whereas sow the progress of the trade is seientific knowledge, so patent to all, has enabled almost every printer in England and Scotland to produce them more or less

These goods, which were exported by the French, and met with in almost every capital city of the world, are now supplied in much larger quantities by the English printer, and to them has been added the supply of a new and increased variety of low-priced prints of a similar class. It is an interesting and carions fact, that the taste in almost every market has changed and improved with the reduction of price.

The English printer has also drawn largely upon his Prench rival during the same period, for another trade which he has likewise, by the aid of the manufacturer and his muchinery, done much to make his own. France has long been famous for her beautiful fabries in fine wod, it wool and silk challes, and in destince. These exposite and costly gools, made of the finest wool, and requiring great care in execution, have been produced and elegance of the materials. With them, France supplied and led the taste of all the civilized markets of the control of the wool, in wool and sitk challes, and in delaines. These

fabric, and a beautiful substitute, at a low price, replaces the more costly all-wool material of our neighbours; thus obtaining the desired cheapness and beanty. Block-printing on this material (the English wool and cottonde-laine) was for some time the only mode adopted; but machinery has since been adapted to it; and the English printer now offers it at a low price, in every market, and creates a demand which the high-priced one would never have known. The cheaper article has brought with it no corresponding declension in taste: quite the contrary, the greater demand, and the increased power of execution obtained by machinery, have led to various novelties in

The English printers have naturally exhibited such articles as they thought would look best in an Exhibition, and be best appreciated by the public. This in a great degree accounts for the absence of the large variety of those cheaper printed goods which form, after all, the great hulk of the English print trade—the staple one, by which she commands almost exclusively all neutral markets, and maintains her position for superiority and cheapness of produce.

Some opinion will be expected from the Jury as to the causes of superiority in the face classes of French goods.
England received the art of calico-printing from France England received the art of calico-printing trons France at the end of the seventeenth century, derived previously by the latter from Central Germany, which had been for some time the seat of the art, originally obtained from Egypt and the East. The trade was first introduced into the neighbourhood of Londen; but after a period of about sixty or seventy years it gradually decreased there, and yielded to the competition from the then newly-established works in Lanenshire, which were nided by cheaper fuel and inhour. These assumed an importance as they extended themselves, in printing on the newly-discovered fabric of cotton calico, just becoming the staple mannfacture of that county. A few print-works yet remain in the neighbourhood of London, employed yet creasure in the nergenourroom or London, employed, chiefly on very fine shawl and silk-handkerchief printing. The English printer, encouraged by his abundance of fuel, cheap labour, and facility for obtaining the largest tues, enemp ascent, and mentally fostered a trade suited to supply of calloo, has attirnally fostered a trade suited to his machinery and capital, which is a complete contrast to the very different class best suiting the French printer to produce. The more limited and costly besseh of the trade has naturally found its chief market in France. and fashion has only a remote influence on inferior classe France is well supplied with cheap and skilful hauds, well practised in the manipulation of fine and deliente fabries upon which machinery caunot so well be brought to bear-in some measure, perhaps, because the orough to oeur—in some measure, persags, occusie toe demand does not repay a large outlay. Singularly enough, that country having the superiority in production in fine goods, possesses also an advantage over the British printer goods, possesses also an advantage over the British printer in demand, having our market free for her goods, whilst the English is probibited from hers, and is denied the advantage of manufacturing for French taste and con-

The French, in proportion to their productions, supply much more largely for the highest class—a class, be it remembered, influenced by fashion, eager for novelty, and tempted by variety. The English supply, in proportion to their production, much more largely for the wear of the middle and lower classes all over the world, many of whom have conventional and national peculiarities of garb not easily affected by novelty. Hence arises the very natural distinction between the tastes of the two nations. It will be admitted, perhaps, that in every article owning the influence of taste, much greater ndvance has been made of late in the productions suited for Value has been made of late in the productions swited for the use of middle class-cossumption, and mpon which the beantiful accuracy of mechanical skill has been bought to bear, than in the higher class of goods, in which manual labour is still thirty used. The blocked massim and the still the still the still the still the still the still contain the still the still the still the still the still the still exist of the still exist of the still eution, than the specimens of a hundred years ago.

Without referring to the samples shown by any parti-cular British Exhibitor, the Jury consider that there are

to be found amongst them very fine specimens of work and taste in burges, in woollen fabrics of different kinds, and in muslin goods,-very good first-class work blocked de-laine goods (the woollen and cotton fabric), equalling, perhaps, in brilliancy of colour, any specimens (either of British and foreign goods) printed on wool alone, showing a triumph of art justly due to the English printer, viz., the giving an equally sound colour un a mixed fabrie, composed of vegetable and animal substances. Choice specimens of machine-work on de-laine, in four, five, and six colours, are shown in some of the collections,-various assortments of the staple calico print trade, in madder-work, permanent and bright in colour, together with specimens of garancine dyed goods, in variety of machine work, all displaying considerable advance in taste, neatness of pattern, and execution; being fine specimens both of engraving and printing, and well representing the regular and standard productions of the houses exhibiting them. In the lower class of cheap machine-work, though an equally valuable branch of manufacture, as supplying a most extensive trade both for home and export, the Jury regret (owing to reasons they have before assigned) that no specimens are exhibited.

Some few good samples of English furniture-prints are shown. Perhaps it may be affirmed that this is a de-creasing trade (except in very low goods for export, of which there are no specimens); and that woven damasks of considerable beauty, and comparatively cheap in price have in some degree superseded the use of calico printed

A fact indicating the change in the English print-trade, before alluded to, may here be noted as further corroborating its progress in chemical science and machinery within the last twenty years. It will be admitted by the older members of the trade, that had there been an Exhiolder members or me trace, that mu there occus as assu-bition in 1831 of English prints, it would have consisted ebicity of fine first-class blocked madder-work, and been confined to the productions of a few printers, who at that time stood far in advance of their brethren, In 1851 the Exhibition shows scarcely a specimen of block-work on ealico, but a great variety of ingenious machine-work by

a number of first-class printers.

Special reference is mude to the variety of specimens of Turkey-red printed and dyed fubries, in the English, French, and almost all the coatinental assortments. ginally, as the name implies, it was a Turkish red, pro-duced at Adrianople. Its brilliant and permanent colon? secures for it a stendy consumption in many markets, and a high average of excellence is shown in its production

Another branch of the print trade, which has its chief seat in the neighbourhood of London, though also parrared in Lancashire, Cheshire, and Scotland, is that of printed silk handkerchiefs. This, too, is originally of castern origin, and is still an article of considerable import, both in the Corah cloth (the grey for printing quon), and in the finished printed Choppah and dyed Bandanna. Great changes have taken place in the relative imports: that of the printed handkerchief having gradually decreased in the last sixteen years to about one-fifth, whilst the import of the Corab has nearly trebled, an equal quality of the same description of cloth, and also an inferior one, being largely made in England—showing in this strict, also, a ogressively-increasing print manufacture.

This trade has been carried on for some years in Germany; but that country consumes chiefly English goods. France, too, within the last few years, has striven to France, too, witchin time has new years, mas striven to establish a trade in printing these poods, and has mude some progress in the inferior descriptions: previously she was indebted to this country (from which she still continues to import) for them. Selections are shown in the British department, excellent alike in fibric and execution, and embracing every variety of style in a trade demanding a regular supply, from the old imitation oriental colouring and patterns, to the fancy picture hundkerchief, delineating in the present instance, as its latest novelty, variously-tinted representations of the Crystal Polace.

The remarks of the Jury on the English print-trade naturally include so many references to the state of the French, as to limit very materially the separate notice which, from its importance, the latter demands.

The Jury have alluded to the high excellence shown in the finer goods of France. The absence of all middle, and lower class Franch prints in the Fathbitton, in finer of any spenmens of the productions of the city of Bouen, its remarkable, as confirming the views already expressed. The French printer has not the advantage of cleap and well-made calico; he is debarred by out from the advantages of extended foreign markets.

The Jury refer with pleasure to the contributions made by the French printers to the Exhibition, and commend the superior taste with which they are arranged—a taste doubless improved by the experience they have acquired at the periodical French Exhibitions.

The character of the French goods, of course, differs

from that of the English, as, being more confined to the expanive class, the tasts is necessarily of a higher order, and therefore present the transfer of the properties of the prime of mirror, the start per operating to the very fine prime of mirror, expanive allow proceeding to the very fine prime of mirror, expanive allow in taste and exerction; to some very bountful dresses of difficult and charge of the prime of the start per operation of the start of the start per operation of the start per operaducer from similar English prints of the same class, because produced on there and more costly eith. Here, to be a start per operation of the start per operation of the lower class, the start per operation of the start per operation of the lower class goods, withink to the wear of the artism and possant, it to be regented.

peasant, as to be regretted.

The Jury notice beautiful specimens of yorn-printed allo, printed on the warp thread before wavang—as article among the lines will ground relicate to linear printed and the special printed of the printed of the printed and t

Some statistical remarks on the progress of the French print-trade would have been introduced here, but the Jary regret that they have not been able to obtain any official information on the subject. Holding the first rank in taste, and second in amount of production, of the European nations, the progress and state of the French trade must from an inter-sting subject of inquiry.

trade and form an inter-traing adapted of adapting trade and form an inter-traing adapted of a dapting contain-linear form Switzerland, preceding to excellent specimens of multin and culico work, block and machine, some of them anongrassed in accession by any in the Exhibition. Tray are specially worthy of notice as the manufactures protection above. Till within the last twelve mouths, Switzerland had no duties on imported prints; lasterly, however, she has imposed a multi facile and salont 13 per interest, the process of the salont process of

various neighbouring markets in Central Europe.

The printed goods from Russis, Prussis, Austria, the
Zollverein, Hamburg, Sardinia, Portugal, Turkey, and
the United States of America, exhibit fewer varieties of
production, of nunequal merit, and each prepared chiefly

for their respective markets.

The Egyptian contribution of printed goods is enrious, as presenting nearly the rudest modern manufactures, the products of English machinery, and purily of English workness; exhibiting the germs of the revival of a

trade in a country which certainly prosessed tha art of printing and dyeing morbated colonism 1000 years ago, the contract of the contract of the contract of the contract choice of Central India; childred by the East India Company. They decree situation as the productions of a country the most andmat in the history of the printing of the contract of the contract of the contract of the things rejected them the three contracts, which so much supersolved the use of other fairles, as to speculate the contract of the contract of the contract of the product of the contract of the contract of the contract of the product of the contract of the contract of the contract of the product of the contract of the contract of the contract of the product of the contract of the contract of the contract of the product of the contract of the contract of the contract of the product of the contract o

One fact, highly creditable to the choracter of the Knthhitten, and the Exhibators of printed flabries, the Jury would wish to state. They believe that amongst the the warlety of British and foreign printed goods, there are no not to be found any specimens prepared specially for the Exhibition, or for above merely, but only such selections from the work of each house as honestly represent its averance produce.

The devicement of the Jury, on the merits of the articles articles of the Jury, on the merits of the article articles calabilistic, have been arrived as from a consideration of the wants of the consumer since, always remembering that is his takes the in its highest foreign, and not any critical is his factor in the highest foreign and analysis. The chief object of the Exhibition is not bright outgetter the finest articles already produced, so they presenting these side by side for comparison, to expect see Winner and varieties, and to induce an in-

In their report on the specimens of dyed goods placed before them, the Jury will remark, first, on those of

Great Britain (India included).

Here will be found dyed wrollen articles, as well as numerous specimens of mixed fairners twoollen and cotton, woollen and linea) in piece-goods of great variety and the piece-good of present variety and land, equally disvensifed in colour and in greatation of shade. The silks used in the manufacture of spitalfields, Maccleddeld, Manchester, Coverty, &c. The wools for the manufacture of carpets and worken and mixed fairler, Newvick, and cleavement. When the present the colour form of the piece-good of the piece-good of the piece-good Newvicks, and cleavement.

The French collection of dyed goods presents a beautiful variety of merinos, but none of mixed cotton and woodlen fabries. Varieties of dyed woods for the manufacture of Parisian shawls, and of silk in the hank, showing that purity of colours, especially in the lighter shades, which contributes so greatly to the success of the Lavouces manufactures.

Suzony, Prussia, Austria, and Russia, have sent many varieties of dyed yarus. In their respective compartments will be found tho

mericos of Saxony and Rossin.

Numberless varieties of woollen dyed yarns for the
Berlin carpets; and from Vienna, for the manufacture
of shawls and damasks,

rancialos, — rais to meritare cantacturers, trite-Lapin, Seydons, Sieber, and Co., manufacturers, Cotean (1381, France, p. 1242).

Genson, A. P., Lyons (1263, France, p. 1237), for skein-dyed silk in various colours; bleaching silk and the plication of picrique acid. Howe, J., and Co., Coventry (36, Class IV., p. 197*), for skein-dyed silk in various colours, Lr. Lievar, H., London (60, p. 557), for skein-dyed

black silk PARTRIDGE, N., Strond (212, Classes XII. and XV., p. 496 , for dyeing broad cloths of different colours

on each side. RIPLEY and Sons, Brailford, Yorkshire (148, Classes XII, and XV., p. 493), for Orleans and Cobourg cloths, mixed of cotton and wool.

VERSIERE, A., Putcaux, near Paris (720, France, p. 1213, for merinos. WEGNER, T. R., Bille (155, Switzerland, p. 1276), for skein-dved silk in various colours,

The Jury award the Prize Medal to Mr. JOHN MERCER, Accrington (48, p. 556), for the beautiful application of a scientific principle in preparing various textile fabrics, strengthening the material, and at the same time wonderfully increasing the brilliancy and intensity of the colonr when dyed or printed. The results are exhibited in the goods shown by Mr. Mcroer. A Council Medal has been awarded in Class II.

The Jury would have felt it a duty to recommend this inventor for the Council Medal, if his discovery had been extensively applied in manufacture.

EDMUND POTTER, ERPORTER.

June 1851.

CLASS XIX.

REPORT ON TAPESTRY, INCLUDING CARPETS, FLOOR-CLOTHS, &c., LACE, FANCY EMBROIDERY, AND INDUSTRIAL WORKS,

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLESTRATES CATALOGUE.]

Dr. Pour-ren Beizer, Calcione, Beltsched; Commissioner, Perra Grants, Physic Chrismas, 2 Oxford Street; Cryen Manufacturer, Rurann Banas, 86-sets, Nutlecham; Lace Manufacturer, Rurann Banas, 86-sets, Nutlecham; Lace Manufacturer, Armer Friedrich, Schriffering, Roseport; relical Cryer Manufacturer, Tuoux Nutson Lot, J. C., Arley Hall, Scorpert; relical Cryer Manufacturer, Faxcoca A. Wannas, Selgion; Merchant at Brussel, Manufacturer, Paxcoca A. Wannas, Selgion; Merchant at Brussel.

M. Farasses, Frankfort-on-the-Maine; Mcrchant. (Proxy for M. Falk, Zollvercin; Manufacturer.)
FELIX AFREAY, Paris; Merebant. (Proxy for M. Lainel, France; Inspector of Manufactures; Member of Central Jury.)

disposal, beg to append to their awards some facts and observations relative to the rise, progress, and present condition of the branches of industry that have come more immediately under their notice,

The Jury are of opinion that the products included in Class XIX., from many countries, are more namerous and various, and differ more widely in price, than those comprised in any other Class. Their task has, consequently, been one of much labour and difficulty, having occupied two months of nncessing attention in seeking out and examining everything said to belong to this Class (the goods from foreign countries not being classified in the Catalogue), and in many cases having to seek for them In other Classes, being most anxions that no omission on their part should be made, and that ample justice should

be done to the Exhibitors. The great variety of products before referred to will second for whet may at first sight eppear too great a ree of liberality in the awards

In deciding upon the merits of the articles exhibited, they have taken into consideration movelty of invention, novelty and beauty of design, excellence of manufecture or execution, cheapness, durability, and usefulness. They have recompensed those Exhibitors who lane

isplayed one or other of those qualities by Honourable Mention, and have awarded Medals to those who, in their productions, have combined several of them.

The Council of Chairmen having confirmed the recom mendation of a Council Medal in the case where the fabric was new, and of great beauty and utility, but not in those cases where great beauty of design was mited with the highest degree of excellence in execution, and applied to articles of commercial importance: the names of those Exhibitors whose productions were peculiarly distin-guished are referred to in the Report.

Having mode these preliminary remarks, the Jury roceed with their observations upon the various branches of industry that have come under their notice.

Tur. Jury appointed by the Royal Commissioners for modifications of the original stocking-frame); since that Class XIX. having completed their impection of the period, there have been incredible sum of money exvarious articles, and avariated the prince placed at their penched, many valuable lives searched by intense site. hundreds of patents taken out, and nearly as many differ-ently-constructed machines bailt for the production of plain and ornamental face of every description. It has been matter of astunishment to see how quickly one inventor has succeeded another, and by simplifying or modifying his machines rendered useless those of his predecessor. It may be stated, thet in none of the textile fabries have there been so many combinations of mu issues have there been so many communators of ma-chinery used to effect the purpose as in the making of lace, commensing with the stocking-frame, to which was added a Tickler machine, then the point-net machine, warp mechine, Mechlin plait machine, and many others. All of these (except the warp machine), disappeared for the purpose of making lace when the bobbin-set mechine was introduced, and its capabilities for making both plain and ornamental lace became developed. The bobbin-net machine is so called from the thread that makes the lace being partly supplied from hobbins, and partly from a warp, the boldins being made to pass from front to back, and back to front, while a lateral motion is imparted to and beek to Iroid, while a lateral monols is imparred to the were phreshes, thus cansing me series of threads to wrap reand the other. After innumerable attempts to much beliefulnes, the first successful machine was made and patented by John Heuthereal, in 1870. This machine, although movel in its construction, and the first nearling one series of threads to pass round the other was complain in its arrangements, as pass round the other was complain in its arrangements, as the property of the pass of the pass of the passes of the plete one hole, the same being now made with six. The cost, also, of the production was such as to circumscribe its use, for we find in 1915, when the machines of this description had increased to 140, one square yard of the produce was worth 30s.; the same quantity can now be purelissed for threepence.

But so rapidly, from this period, did the machinery increase and trade extend, that in 1831 the capital canployed in the bobbin-net trade, from eareful inquiries mate by a townsman, W. Felkin, Esq., was 2,310,000L, giving by a townsman, w. relatin, page, was 2,100,000 g. gring permanent employment to 211,000 persons. It is desirable to state that, up to this time, little less than plain net and quillings had been produced by the bobbin-net ma-chine. After repeated efforts on the Leaver, circular, Bolles Art Marines der, his es his loss collection of the removement her, his esh his coules, fine for her methemselme her, his esh his coules, fine his coules, fine his coules fine his coules fine his coules fine his coules for his coules fine his coules for his coules fine his coules for the his coules fine his coules for the his coules for the his ging-century. Fifty years app, her need by machinery san exceeding the his coules for the his coules and for the his coules for the his coules for the his coules for the his coules and his coules for the his coules and his coules for the his coules for the his coules for the his coules and his coules for the his coules for machine end then by another, was astonishing, each diseovery leading the way to something more novel. At this period, also, a patent was taken out by William Sueath, of Hyson Green, and sold to James Fisher, Esq., of Badfard, for spotting on the circular machine; soon ofter another was taken out by Mr. Freeman, of Tewkesbury, for spotting on the traverse warp; and shortly after e third by R. Birkin, of Basford, for the same thing on

the Leaver machine. Many efforts were made by Drapet, and others, to apply the Jacquard machine to the bobbin-net for the purpose of ornament. Several patents had been taken out for this purpose, but no successful arrangement bud been effected till about 1839, when a pusher machine was worked with cards the width of the net, by Mr. Wright, of Radford: the same application was made to the circular machine by Mr. Crofts, who has taken out several patents for various improvements in nearly every descrip-

tion of bobbin-net machinery. The application of the Jacquard still progressed slowly till 1841, when a plan discovered by Hootan Deverill was bought and patented by Messrs. Biddle and Birkin, for applying the Jacquard to the guide bars; and so rapid has been the application of the Jacquard since that period, that at the present time there is scarcely a machine at work without it (except those adapted purposely for plain net), either applied to the bars, or along the width of the machine, and from that period the trade commenced anew, producing every description of pattern on all the various descriptions of met kanwa, particularly on the plain-net, that had been made and patented in 1838 by Mr. Crofts, but was not extensively manufactured till the successful opplication of the Jacquard. Such an impetus did the trade receive from this, that bundreds of nuchines which were useless, or "worked bundreds of machines which were uncless, or "warked ng," as the trade termed them, were brought into active and profitable use; many of their owners, after spending from 801, to 1001, being able to realize this outlay in three or four weeks (if put on with a saleable pattern). No sooner was the Jacquard machine successfully subspect to the bobbin-net unachine, than new sources of inaunifies. ture gradually developed themselves, such as flounces, scarfs, shawls, window-curtains, &c., &c.; but, to succeed in these articles, tasteful and elaborate patterns were required, equal to the French and ather foreign productions of the same kind: manufacturers had in many instances to resort to those places for designs. This want of clever local designers caused the same enxiety to be manifested by the makers of machine-made lace that other manufacturing districts had evinced; and the same cordial assistance from the Government was afforded in establishing a school of design in Nottingham.

Though many for the first two or three years thought this school comparatively useless, it has proved that it was only sowing the seeds for extended unefulness, as young men, that have had no other means of learning desiguing, and creating a taste for the fine arts, ere now filling important situations, and receiving liberal salaries; and there is no doubt that at the present time

our local artists are capable of producing designs equal to the French, Swiss, &c.

We may be told, the display of lace goods in the Great Exhibition does not demonstrate this statement: but it most be borne in mind that the manufacturer of machinemade lace has to have his pasterns adapted to suit the various markets; and they know from experience, that patterns that would suit the French would not be saleable to any large extent in the English market (and English-made lace being prohibited in the French market, it is useless to adapt our patterns to their taste). In fact, there requires one style for the London market, another for the provinces; one for North America, a different one for South America, and so of all the various markets to which we export our produce.

It will, therefore, be perceived, that the French are

rarely employed in designing, except for the Parisian taste, where our designers have to suit the tastes of nearly all the markets in the world.

Judging, therefore, from the beautiful patterns now produced, their suitability to the markets for which they are specially designed, and the rapid manner in which this part of the trade has extended, we think it right to state here that the Government School of Design has materially assisted the enterprising manufacturer and

At the present time, amongst the infinite variety of erticles manufactured by the bubbin-net machines, are-1st. Black silk piece net ornamented, sknwls, scarfs, flources, trimming laces, bloudes in white and colours, some whally finished on the machines, others partly by

machinery, and embroidered afterwards Up to 1845, Saxony exported largely the lower class of these, and France the more expensive into this country;

but so perfect are they made, so much improved in design, so effective for useful purposes, and lower by from 75 to 99 per cent, than the class of hand-made articles they represent, that we not only supply our home market, but have exported 150,000i, worth annually, during the just four years, to foreign markets, principally the American. and not a few find their way into France, although wholly probibited by that country.)

2nd. Cotton edgings, laces, and insertions, lines been in imitation of white pillow lace, muslin edging and lices, fancy piece net, spotted net, plait net, in unitation of the costly Valencienues lace.

3rd. The third class is of curtains in imitation of the Swiss curtains, bed-covers, and blinds; and although this hranch of trade is new, heving only been introduced in 1846, yet from the extent it has already attained, employing above 100 machines, and from the display of goods exhibited, excellent in design and good in texts it promises not only to be an important but an improving department of the lace trade.

4th. The fourth class includes silk and cotton, plain net Mechlin grounds, blonde, Brussels, or extra twist: this is a branch of much importance, employing regularly upwards of 2,000 machines; one owner, J. Heathcoat, Esq., M.P., having 300, principally making silk act, or Paris bloode. To this gentleman the trade owes much Paris bloome. To this generalized in discovering the method for his zeal and perseverance in discovering the method of imparting that dress or fluish to his nets, formerly known only to the French, and the accomplishment of which is now giving permanent employment to many

thrusands of workpeople.

the Exhibition.

The numerous and various specimens of Nottingham manufactures in the Great Exhibition, their generally useful character and extraordinary cheapness, combined with very considerable taste in design and excellence in execution, must tend to still further develop the ingenuity and extend the trade of the locality. The description of machines et present in use are the

following : 1st. The "Leavers," so called after John Leavers, the original constructor of this machine; e specimeu of which belinging to Mr. Birkin of Nottingham, is et work in

Most of the articles included in the first and second class productions are made from this description of machinery

amery.

2nd. The "Paster" machine, so called from having
adependent pasters to propel the bobbins and carriages from front to back, instead of pulling or hocking them, as in other arrangements.

From this description of machine are made shawls, scarfs, flounces, &c., of a superior quality, which require to have the pettern traced afterwards with a thick thread hy won

3rd. The "Circular," so called from bolts or combs on which the carriages pass being made circular, instead of straight, as in the straight-holt machines, originally constructed by Mr. Morley, of Derby (late of Notting-From these muchines ere made the curtains men tioned in Class III., and the various descriptions of plain, spotted, and fancy nets.
4th, A few "Traverse Warp Machines," so called

from the warp "traversing" instead of the carriages, as in the circular and pusher machines. These machines These machines principally make spotted lace, blood edgings, and imitaon thread laces.

There is a smaller number of machines now than in

1856, owing to many of the old narrow noe having been broken up and replaced by others, wider, more speedy, and of a superior construction. Though numerically less, the power of production is materially increased: io addition to this, arrangements are now made in many of the contraction of the con

employed in 150s.

There are now in full operation 3,900 beloble-set machines; the total number of quarters \$4,500, giving employment to \$3,600 mem, \$4,500 mem and rehibers, polyment to \$5,500 mem, \$4,500 mem and rehibers, and the same and and one machines; and the office for itsil-throwing, cotton-pinning, dyyling, blenching, and dresting; for boundary to the same and also and carriage guada, comb and plotted to the same and the

Total capital 2,965,945l. Total number of hands employed 133,015. Annual amount of business returns 2,300,000l.

2,380,0004.
These statistics are the result of extensive and careful inquiries made purposely for the occasion; and are as accurate as such documents can be, considering the difficulty, in some cases, of obtaining all the facts from maonfac-

The "Warp Machine."—In addition to the bobbin-net machine for making lace, there is also the warp machine, several productions from which are exhibited on this occasion, of a novel and beautiful description. The invention of the ware frame about the year 1775)

The unrestine of the warp frame (about the year 1770), Working, John Man, Care, of Edinamon, were Lookon, Mr. Marsh, Morris, Mr. Care, of Edinamon, were Lookon, Mr. Marsh, Worting Hard, Warth, Worting Hard, Warth, Worting Hard, Warth, Warth

The first machines were about 16 inches in width, and they were merely the common stocking-frame, with the warp or new principle applied.

In the years 174-5, a person amond James Tarmit, a contained by impressed them by any his reductive to person outside the person of the person

This new manufacture rose to great importance, and large contract for the Admirstly were supplied. In the year 1812, 500 frames were said to be employed in the midland consider on this article, which is still innown as "Berlin," and its extensively used for the making of "Berlin," and its extensively used for the making of Tames were at work in the neighbourhood of Nottingham. About this period, two persons of the names and Bown and Plader, made silk lacer from what they termed

an upright-warp frame (from the needles being placed upright, and not horizontally, as in the ordinary warp frame). In the year 14th, 120 of these upright frames were at work in Nottingbam; and the wages of the workmen were very high, never less than 5th, nor week.

In a very abort period, lace was made from the horinotial warps; and the uprights were soon rendered nonless. The first lace produced was of a very inferiordecerption; and various attempts were made to improve it. At length, Brown and Copestake invented what was called Meehlin net, which, from its intrinsic excellence, soon entirely super-seed the point net; and in a short inter-80 frames were making it; the wages of the work-

soon entirely superseded the point net; and in a short time 430 frames were making it; the wages of the workmen averaging four guizeas per week; whilst the cotton used was 15 guineas per B. From this period the pointnet manufacture declined, notil the beame quite extinct; and the warp machine was in the ascendant. Soon after the introduction of Machine less an insite.

Soon after the introduction of Mechilin lace, an initiation of it was made by a Mr. Kirkland, which was known as "two-course" net; and another kind of silk lace known as "Honde," inverted by Dayceck, appeared about the same time. These two kinds of silk lace subsequently attained to great importance, especially the latter, which still forms a considerable brauch of the lace reads.

The blonde, soon after its introduction, became in great repute, and the workmen made enormous wages—it is said, as much as 10l, per week.

said, as much as 10*l*, per week.

In the year 1819, the Mechlin disappeared; and soon after the two-course and blonde greatly declined until 1850, from the large importations of French sitk-lace; the French method of dressing being much superior to

onr owo.

The bohhin-net machine, which was invented and patented in 1809, had now become the great rival of the

Critica "Mechiia" Ince apscully disuppeared before the more approved manufacture, belobin-rat; and what from this new competitor at home, and large importations of silk have from Prance, the warp rates may be considered in the construction of the machine might be bought for the price of old iron; and many were broken up as no longer or use. Such was the state of this branch of Industry when streetine was directed to the correspondent of the work of the streetine was directed to the correspondent of the construction of large or wholly plain, and was embroidered or "tamboured" ashevants by home

Driven from the plain by the bohbin-net, the warp was the first to attempt the ornamental; and has the credit of leading the way in what has become the most important branch in the lace trade. Boot, Roberts, Herlsert, and Copestake were the earliest in the field, and laces with spots and bullet holes introduced first appeared.

A new bilas of zer a sine was produced, which was called "much vasts, in instance or in read the holishment," much vasts, in instance or in read the holishment, which before was worthless, rose to a great called the produced by the state of the state o

greathy uppressure metaline again outrivalled its forerunner by producing superior ornamented laces; and Heathread's plain silk hobbin-net had now begun to take the place of Nottingham white silk blonds. Notwithstanding these, the unemployed warps found other and new channels. Some were making gimps, and a still greater number lace mitte and glivers, which, from 18:06 to 1846, were of great demands but these, during the last

few years, have nearly become obsolete.

In 1839 the Jacquard was applied to the warp by

Draper, of Nottingham. The increased cepability which this application gave, inspired new bope for the warp-lace trade of Nottingham. A new class of products of claborate design was manufactured, such as showls, searfs, mitts, falls, laces, &c.; but latterly the products of the Twist machine have to a great extent supplacted them.

Great improvements were made in dressing silk lace. Mr. Dennicliff first fullowed the French method of working the silk in the single thread, and in the raw state, instead of the organzine thrown which had heretofore been used. The result of this change was soon felt. ours was now equalled in whiteness and brilliancy; and at the present day, English-dressed lare is little, if at all, inferior to the best specimens from Lyons. Within the last few years, many new kinds of manufacture have been ettempted from the warp, which deserve a special

Elastic woollen cloth for gloves and other purposes is one of these. Henry Dunnington of Nottingham was the first who made it, and he has produced the best of this

Many new kinds of elastic fabrics for gloves, both in silk and other kinds of material, have been made by Messrs. Bull and Co. A patent for valvet lace was ob-tained by Dunnieliff and Dexter in 1845; but the making of velvet was not brought into practical operation until 1849, when Messrs. Ball and Dunnicliff, and Messrs. Haines and Hancock, succeeded in making piece velvet suitable for gloves, the product at the present time being entirely used for this purpose,

During the past year the same parties have had granted a patent for making velvet in combination with lece; and or other novel wesvings, specimens of which are shown in the Greet Exhibition.

These latter may be considered as the latest improments of the warp frame, which bring down our notice to the present period.

The number of machines now in operation, as far as

ean be ascertained, is about 1,400; 600 in the county of Leicester; 400 in Derbyshire, and 400 in Nottinghemshire, and are employed in the verious branches as fol-

> 150 blonde, and other silk laces. 150 cotton tatilings. 550 Leicester hosiery, &c.

lot lace gloves and mitts. 150 woollen cloth, hoslery, purses, and various kinds of fabrics for gloves, &c.

The average widths of the machines employed in the Nothinghem trade are from 90 to 100 inches (some few being as wido as 150), whilst those engaged in the Leicester hosiery trade, are generally from 44 to 72 inches, The number of persons employed in the warp trade is estimated at 10,000, and the capital invested 360,000. making a return per annum of 700,000/. On a comparison with former returns, it will be observed, that the number of machines employed in the lace branches is considerably less, whilst in the hoslery and other miscelconsiderably less, whilst in the nessery and other miscer-laneous articles the nembers have increased. A werp bloude-machine, 54 inches wide (which was about the average in 1830), would produce about 20 yerds or 80 racks per week, which, when dressed, would be equal to about 50 square yards.

The power-unchine belonging to Mesers. Ball, Dun-steller, and Co. in the Great Exhibition, illustrative of the warp-ince trade, is capable of producing-working 12 hours per day-800 racks per week, which, when dressed, would be equal to about 1,200 square yards. A yard of 4-quarter white silk blonde, which in 1830 sold for 2a, is now supplied for 6d.

LACE made by hand, as "Honiton," and "Thread" or Pillow Lace, also "British Point," Tambour, and LIMERICE LACES.

Honiton Love. - The description of lace termed "Ho-

pillow, and employing pins, bobbins, and spindles to twist and interweave thread in such a manner as to produce the required design. It was formerly confined to the production of simple sprigs and borders; bet during the past twenty years considerable progress has been made, resulting in the manufacture of fabries, displaying not only extreme delicacy of execution, but also beauty, and taste in design

The Great Exhibition affords ample proof of this in the specimens of flouncings, shawls, scarfs, handker-chiefs, berties, &c., which are there exhibited, varying

in price from ten to two handred guineas. This striking change has not arisen from fortnitous

circumstances, but has been mainly induced by eminent houses in the trude; who, to meet the taste required by their customers, have employed every means at their disposal to raise the character of this description of lace, They are fully alive to the conviction that the more the British manufacture becomes assimilated to the characteristics of the foreign (which are chiefly suitable, beantiful, and clearly-defined patterns, with refinement of execution), the more the demand for this lace will extend; and, proportionally with such increased demand, they will be induced to expeed still larger sums, in order to produce a higher class of designs. They are further encouraged in their exertions by the fact that, although the British lace cannot boast of design so exquisite, and execution so delicate, as Brussels Ince, it yet possesses remarkable and valuable qualities, inasmuch as it is produced perfectly white, does not change colour, and the price is very moderate.

The district in which illoniton lace is made extends about 30 miles along the coast of Devonshire, and about 12 miles ioland. A very large number of persons (from 7,000 to 8,000) are now employed in producing it.

or "Thread" lace, although made upon the cushion like ilonion lace, is distinguished from it by having both the pattern and the mesh made by hand, whereas, in Honiton lace, the pattern is made separately, and afterwards sewn on to machine-made net.

Not many years since a very considerable number of somen and children were employed in its manufacture throughout the counties of Bedford, Buckingham, Northampton, and Oxford; but the demend having fallen off (being subject to fluctuation, like all articles dependent upon fashion), has coused this branch of the trade to suffer severely. Contemporary, however, with the diminution in the making of white-thread lace, an increased requirement for black lace occurred; the manufacture of which was introduced into the districts enumerated, and has been attended with marked specess.

It would be difficult to supply any accurate statistics as regards the number of persons engaged in this manu-facture, as the nature of the article enobles the parties employed in producing it to earry on the operation agart from each other, and without interfering with a domestic or retired life. It is deserving of consideration, that the worth of the

actual material bears sech a small proportion to the value of the article itself, as to make the amount paid for the labour expended in its production to be almost the sole cost. This industrial product, therefore, cannot fail to enlist sympathy on its behalf, as it furnishes, in comparison with its price, a surprising extent of employment and maintenance, and these benefits, moreover, are afforded to a class of persons who otherwise would have a difficulty in earning a livelihood. In exemplification of which it may be said, that the poor in lace-making districts are comparatively well off, and better provided for than in other localities, British Point Luce.-British Point, tamboer, and

Limerick laces, possess alike considerable merit, as very similar in the mode of their manufacture. embrace the imitation of Honiton and Brassels lace, and are produced in shawls, scarfs, dresses, Court trains, suncings, lappets, &c., exhibiting a beautiful display of chaste, elegant, aed elaborate designs, and are well represented in the Exhibition,

"British Point" is chiefly made in the neighbourhood niton" is made by placing a perforated pattern upon a of London, and is very superior as an imitation lace,

"Tambonr" is made principally at lalington, London, Coggleshall in Essex, and at Nottingham. The "Limerick lace" is peculiar to Ireland, and has

The "Limerick lace" is peculiar to Ireland, and has been produced in considerable quantity. There is also another description of this lace, which has been brought to great perfection. It is made in

various articles, and prescots an excellent imitation of

the old Spanish point,

The prospects of those branches of the British lace trule are at the prevent time highly encouraging; and there is no doubt that by energial attention in producing properties design for Hamilton lace, and the entire and interest in the second of the second of the contract of this lace with the most successful in their exertions of worthy of the increased submiration of ballows of rank and the second of the second of the second of the second product when the second of the se

From the well-known character of the principal houses engaged in his enterprise, it may be considerily expected that Houton loce will assume a position in the highest class of industrial art, coulomed with nitily. Nor are the manufacturers of the other descriptions of lace montioned in this Report at all behind in an energetic application of their resources, in order to excel in their various productions.

The decided improvement which has been made in the black laces, now so generally worn, has led to the introduction of a new and important feature in the fabrication of pince goods, such as shawls, searly, vels, coffuers, Re., the manufacture of which in "black point lace" has commenced within the last twelve months, and is carried on in the southern districts of Beckinghammire. It has

on in the southern districts of Blockinghammhire. It has already been attended with marked soccess, and is descring of special notice. It is a gratifying reflection that the growing appreciation of the weilthy and refined class of the increasing merit of these really useful and ornamental articles of British manufacture gives suitable employment to a large

number of females at their own houses, thereby increasing their comforts, encouraging habits of industry, and adding to the general prosperity of the nation.

ENGLISH, IRISH, AND SCOTCH SEWED MUSILIN EMBROIDERY,

The national importance of this branch of industry, its rapidly increasing extent, and the progress made in its manufacture, as evidenced by the number of exhibitors from the United Kingdom, and the varied merit of their

from our Ornect suggestion, and construct our other productions, and for particular markets and for particular markets and for particular markets and for an art for, and Messrs, So, R, and T, Bnown, both of Glagow, and Messrs, So, R, and T, Bnown, of Paisley, are very grafifying proofs of the excellence attained both in descriptions.

In taking a retrospective view of the trade, it is difficult to fix the precise date of its origin; but there is no doubt that in the year 1770, in Scotland, and 1780, in Ireland, the germs of it were in existence. Towards the commercement of the present century the

manifative had so extended as to employ prefitably the attention of eight or two houses in Glugows, and also a few in Belfast; but the trade generally seems to have made but little progress during the sent twenty years, and the immufacturers principally confining their attention to the tambour branch of it (with the exception same light certical goods for foreign surface), in the and body lines.

in the of the creamstance which first pave a decided impulse to the manaferance was consistently the social revolution wronglet among the Scotch and Irish peasantly and particularly the latter, by the destruction of lines and particularly the latter, by the destruction of lines machinery. Previously the female population were so generally and profundly employed that it was with much difficulty their attention could be directed to "needlefacture by anachinery had nearly destroyed the occupation."

of hand-spioniog, and the softened hum of the "wheel' in ceased to be heard, both the women and girls of the country were left almost without any source of profitable labour, and a very serious change became apparent in the homes of the personatry.

In their trying elevantones a new field of labour, and admind to more than compensation approach to their adminds to be seen that no emperature are proposed to them projective exhibited as the contract to the projective exhibited at the contract to the administration of the contract to the administration of the contract to the administration of the contract the contract and enter their positions, but foregoing saided by individual philanthropy, selected active and their position and the contract their constraints and enter their positions, but foregoing saided by individual philanthropy, selected and still more extracted principle in the West of Sectional, and still more extractedly in the North of Ireland, the works that is a short precision in the West of Sectional, and still more extractedly in the North of Ireland, the work which is that so existence, the grint them, as now, principle of the section of the principle of the

I are compared or mooth attouch to, and the increasing skill of the workers, enabled the manufacturers to introduce, in lice of tambouring, the more costly, difficult, and beautiful "astin sitch," and other searcl enbroider; its cheapness and soperior elegance not only leading to its being applied to additional articles of ornamental dress, but also to more enlarged use and decanad, and to

a consequent increase in the trade.

In its internal operations few circumstances were more

levedicial to the manufacture, or tended so directly to the improvement of design, as the malaritation, about the year blow, of fithegraphy, for that of the old tediess provided the second of the second of the concept block varied from 5... for the cheepest design, to \$2. for the relevant, and the time required fee entires \$2. for the relevant and the time required fee entires to \$2. for the relevant of the control of the control of the constitution of the control of the co

when he some the second properties of the second properties and second properties of the second

The amount of employment in Ayrshire, and other places in Scotland, has uot probably increased, from the population being less dense, and their being employed in other branches of manofacture; but in Ulster and the West of Ireland the embroidery trade has become almost mivernal, and is the principal support of the female

production. The production is the state of the production of the state
depending in some degree on the prosperity or otherwise of the trade. Young and inexperienced workers will probably not receive leyond streece per week, the amount gradually increasing to 4n, 5n, and 6n, according to the dexterity of the worker; and a few first-class hands can occasionally earn as much as 10n, per week.

in the dexterity of the worker; and a few first-class hands can occasionally ear an sume has 10s, per work, hands can occasionally ear an sume has 10s, per work, he trade cannot be at this moment proceedy ascertained in wireasily estimated at from Tokowa to 1,000,000. The proteins at least tox,0000, the principal outlay consisting in labour) will be distributed in wares, the and in a shape the most beneficial, as they can thus, by and in a shape the most beneficial, as they can thus, by

their own industry, increase their comforts without endangering their morals.

The market for the industrial productions daily enlarges both at home and in the colonies, where there is ever a ready and secure demand. That of the United Rates ranks next in importance. A few years ago the Transulantie export of embroideries was mercky moniting;

now the United States take at least a quarter of a million's worth annually.

It is also a gratifying fact that, notwidensusing the prevalence of hottle tarifs, the boundary and cheapees of the Scotch and Irish embrodieries muse them to find an increasing said, even in the most relaised of the contition of the state of the said of the state of the totally inadminishle, they are nevertheless daily introduced, and one particular class finds extensive from in the findionable circles of Paris. Also, from various countries of southern Europe, a gowing demand in continuous control of the said of the said of the become on important as to lead to a further and valuable extension of this branch of industry.

extension of this branch of industry.

In the Exhibition the home embroidery trade is well, but not more than adequately represented, a great number of parties not having sent any of their productions; however, among those who compete are several who rank first in the trade, and in their hands the reputation of the

first in the trade, and in their manufacture is fully sustained.

While the foreign productions, exclusive of cartains, are chiefly conflued to cambric handkerchiefed, mustin robes, and funcy articles, such as coveriets, table-covers, amoval designs, the, the home manufactures exhibit largely every variety of collars, sleeves, crafts, caps, insertious, and trity and retained to some benefitted insertious, and trimanings; also some benefitted insertious on the constitution of the control
As regards the fature prospects of the trude, they are of a decidedly loopfed character; the manufacture may not in future progress in the same autoinshing ratio as hitherto, but here are sample grounds for expecting a further and important extens work, which is being affected, as well as on the important case of change labour. A great amount of this labour is in process of training, and will continue to be aboved to loop as the employment in will continue to be aboved as loop as the employment in energy agarantee for improvement in the work and consequently extensive size.

Much has been done already to improve design, the statestion of Government and of the trade being strongly directed to its importance. The Government schools, specially, by affording manufacturers and pureats genrally the opportunity of electing their children in described to the state of the state

inflet or severy manufactorous conditional reproduction. In conclusion, with a lattice of middlettimes popular for control production, with a lattice of control freshed and in Scotland, possessing a decided aptitude for the employment, and willing to labour for a moderate remaneration—the manufacture conducted on the largest scale, with all the advantages of capital, a home market, extended foreign relations, and all the other facilities of commerce—the embodiery trade may reasonably expect

not only to maintain its position, but look forward to an increase and prosperity hitherto unknown,

FRANCE.

Lace and Embroidery.

France, proverbially a lace-making and lace-wearing country, has, on this occasion, maintained its high position by contributing some of the most exquisite work, printed

cipally band-made, that has perhaps ever been exhibited, combining perfection of design with surpassing elegance. In proof of this, it is only necessary to refer to the articles exhibited by Mears: Vipacoq and Sinos, and Accurra Expragrate, both of Paris.

The amount of business done, and the number of hands employed in the manufacture of lace and embroidery, are

employed in the manufacture of lace and embroidery proofs of their high estimation in all countries.

Bobbin-net and Lace by Machinery.

The principal towns noted for the production of bobbinnet and lace by machinery in France, are Cambray, Lille, St. Quentin, Lyons, and, above all, Calais and its subnrbs, where there are more than 600 machines in active opera-

The manufacture of this article was introduced into France by English worknea, who, coming from Nottingham, established themselves at Calais, in 1817 and 1819, bringing with them a machine upon the "straight-holt" principle. This branch of Industry has continued to increase and prosper, baving always followed the progress and investions introduced at Nottingham.

Until the year 1845, the articles 'fabricated in France were only such as were known in the English market; but since that period this branch has been considerably improved by the application of the Jacquard system to the bobbin-net machine, more especially to that called "Leavers," and in consequence its production of articles of novelty bas greatly increased.

The following articles are manufactured in a superior style, principally at Calais and at St. Pierre-les-Calais: lst. The Neuville ground, with coarse thread, on

Leaver's machine.

2nd. The Malines. In order to imitate the lace of this

name, made on the pillow, it is puried, and the pattern embeoidered by hand.

3rd. The fine plat, made from 14 or 16 point machines.

3rd. The fine plat, made from 14 or 16 point machines, in imitation of the pillow-lace, called Valenciennes. 4th. The coarse plat made from 10 or 11 point machines.

At Lyons, a great quantity of silk net and black lace is made in initation of pillow-lace. At Cambray, also, is produced, with great skill, black lace in lengths, and in piece, for berthes, scarfs, &c. These stricks are made on the circular machine, and

are admirable imitations of the beantiful black lace of Caen and Chantilly, the patterns of which are most correctly copied, while the difference in price is 73 per cent, This manufactory is in full work, and has been steadily improving for the last three or four years.

Embroidery.

Emhroidery work of every description is of very ancient date in France: it gives employment to from 150,000 Familes, spread over more than twenty departments. 8d. to is. a-day is earned in the country, and double that sum in Paris.

This branch of ladustry is subdivided into several parts, which may be placed under two separate heads. 1. Embroidery in colours and fancy work.

Embroidery in colours and fancy work. White embroidery. Pancy work embraces on infinite variety of forms.

Fancy work embraces an infinite variety of forms, and is done in all colours, in all shapes, and on every kind of material.

The two chief seats of this manufacture are Lynns and

Paris. It is in the latter place particularly where that great variety of tasteful articles of every description, that occupies so large a portion of its industrious population, is fabricated; for example, embroider; in cotton, wood, silk, straw, gold and silver, thread, beads, &c. &c., and it is from the workshops of Paris that those magnificent fabrics are sent forth, from rich robes, shawls, and scarfs, to the smallest faucy article, such as purses, bugs, Greek caps, cigar-cases, &c.

If the enhroidery in facey articles is so considerable, much greater is that of white embroidery; in fact, this work is carried on in many different ways, hy hand, in a frame, with needle, or crochet, with passe or plumet, &c. &c. White embroidery is always done upon lace, muslin, or fine cambrid.

Embroidery for furniture is principally dune in crochet. The chief seat of this branch of manufacture is Tarrane, where lace and mustlin for curtains and window blinds are worked; as also monselline-de-lains for ladies' dresses, mantles, and pelerines, which is likewise in crochet. At Lanceville the work is principally done on talle with the needle, and ensisting generally of searts, dresses,

collars, peleriues, and other articles of taste and novelty. But the very fine embroidery in satin-stricts, for articles of laxury, is the most important part of this hearnesh. The seat of this beautiful manufacture was formerly Nancy; but for some years past it has extended to the departments of J.a. Mearnesh, La Moselle, La Meuse, and

departments of I.a Menelle, I.a Moselle, I.a Messe, and des Voeges (forming the ancient province of Lorenine). In these departments they formerly worked on the hand only; hut, for the last four or five years, frame embeddery has been more esteemed as giving greater neatness and perfection to the work, particularly in the extra fine. Special attention is now given to the instruction of the new hands in the use of the frame maly.

It is in the department of the Vogen that this were written to the contract of the Vogen that this were hand been streted with the most complete increas. The waters of this department lawe great againstic for the characteristic of the Frozenbouran is the remarkable mate the displays in her work. In this delicate, and the displays in her work. In this delicate, and the contract of the characteristic of the characteristic of the characteristic of these tasts and intelligence. The French work women of the characteristic of the characteristic of the characteristic of the characteristic proposed and as difficult to details. This resolution is an analysis of the delicate of the vision of the places of the characteristic of which here by bothing or eachly, pressulp known throughout France, and which offers so many pursues her work a those with the family, beving off when howehold affairs require her attention, and taking when howehold affairs require her attention, and taking owly many contract of the characteristic of the ch

Hand-made Lace.

The manufacture of lace by hand in France gives employment to npwards of 200,000 females, from six to seven years to a very advanced age; each individual earning, npon an average, for a day's work of 10 haurs, from 6d, to 1c, sometimes more, according to her skill, or the demand there is for the article.

All Freuch lace is 'made with bobbins, npon a small portable pillow or cushion, except at Alençon, where the needle is employed and working an parchagent.

needic in employee and we wang on parcialcon-This branch of industry has latterly increased to an immense extent, and nothing can be more admirable than the heavity of the patterns, combined with the purity of the work and delicacy of the web. Hand-spun linen thread, cotton, wood, silk, and often

gold and silver thread, mixed with the silk, are employed. The great expense in this manufacture is the labour, for in the cust of France, acting up work, and the purchase of material does not exceed, upon an average, 12 to 18 per cent, of the whole.

About twenty years ago all the white lace was made with

About twenty years ago all the white lace was made with lineu thread, spun by hand (called Malguinerie thread); ut present, however, it is rare to find any other used than cotton thread, Nos. 120 to 320.

White und black blonde and black lace are manufac-

White und black blonde and black lace are manufactured in the same manner as white lace, there being no difference in the work, the material alone being changed. Formerly white lace only was made, at present blonde and black silk employ half the workers. This branch is spread over a great part of France, extending from some to somb-east, through fifteen the opments. Each district has a peculiar style, and what is very remarkable, that, although made in the same way, with the same material, they are instantly recognised; beach the different appellations by which they are knawn, beach the different appellations by which they are knawn, following are the principal places where this manufacture. The following are the principal places where this manufacture is carried on in France:—

Csen and Bayeax.
 Chantilly and neighbourhood.
 Lille.
 Arras.
 Missourer

3. Lille.
4. Arras.
5. Mirecourt.
6. Dn Pay.
7. Boilleul.
8. Alchron.

For an explanation of the productions of the abovementioned establishments, a short notice of each is here

1. Core and Bayear (Calvados). The manufacture of lace in these phones is much the same, and is the most extensive in silk lace, in length nnd pieces, employing from 32,000 to 49,000 romen. The manufacture of silk lace at Caco, and particularly at Bayear, was formerly very little known; now, however, it is different, and searcely any other tissue is made.
The first silk bloode was made at Caco, and called

The first silk blonde was made at Cach, and called blonde, being made af andyed silk of a mankin colour; now they only use silk af the finest white, or of the finest black, with the exception of a few coloured blondes.

The blands manufacture had rapidly rices be great opportunition, and contrainable is but property; a demand for the article became every day dimitation, and the mostivey of the sovetone are now employed an black than mostly of the worker are now employed an black than the source of the source of the source of the source, bearing a source of the source of the source, the source, manufacture is not seen to so the source of classical seen are considered in this work, and are considered in the source of the departs of the source of classical seen extendably spice is this work, and so that the same is not seen to see the source of the source what flowered parts in one entire piece, so that the ansies in partners in the thin a much, with his cert for person, what flowered occupied a work-woman one whole year, what flowered occupied a work-woman one whole year.

2. Classifly—Though this is a same given to a particular late, else the place of its kith; its fisherison has been principally removed to the neighbouring district. This lace completely resemble that of Bayers, except has it has been offent to much reported preprince, consequently, range higher. Fewer hands are employed than at Bayers, but the improvements of the latter have been regularly adopted. The articles natingfured are less intended for grown me, thus no mittly the textures and much beautiful patterns.

textures and most beautiful patterns. Settle of the pattern of the

 Arras, Pas-de-Calais.—This manufactory is in the same condition as that of Lille. The lace of this place is, however, esteemed for its low price, but the designs require to be improved.

 Mirecourt, Vonyos.—Contrary to that of Arras, this manufacture is constantly introducing new designs. Nearly all the improvements and novelties in lace-making proceed from Mirecourt, which is renowned for the good taste and elegance of its productions. The same kind of lace is made here as at Lille and Arras, that is to se clear foundation, and "fonds de champs," in white thread-

They also produce here a lace, very much resembling the Honiton, called "guipure." Within the last four or five years flowers have been made and sewn upon that extremely fine net termed "Brussels net." This fabrie has, in two years, been so much improved that it now bears a close affinity to the Belgian, at Biache and at Brussels, and is greatly esteemed for its admirable white-

ness, its fine quality, and moderate price. 6. Pay, Hante-Loirs,-This town employs the greatest umber of workpeople in France, from 40,000 to 50,000 being spread through the neighbouring departments. The face made here is coarse, and not rich in texture, but of low price. At Puy all kinds of lace are also made in silk, thread, and wool, as well as point, clear point, point de Chacey, and point de Valenciennes. This town also produces black and white lace, hlonde, and other articles of every colour, and especially worsted lace, in pieces, shawis, scarfs, &c. This manufacture promises much for the future, being situated in a province where there are few other industrial resources, and where labour is con-sequently cheap. The workwomen of Puy and its en-virons are very skilful, and yet, up to the present time, they have only succeeded in ordinary srticles, for which

there is no competition. Builleal.—This is the only important town in France for Valenciennes: it produces lace of the same kind as that of Bruges (Belgium), but rather coarser. The lace of Bailleul possesses two valuable qualities, being the whitest and the cheapest. This lace, though somewhat

**Miles and the Outages. In a lact, is regarded as Almons, One.—The lace of Alençon is the only fidther of this description not made on the pillow, being worked entirely with the needle. It was introduced into France in 1660, by Colbert, who sent to Venice and Gônes for workmen, and they introduced the point de Gônes for workmen, and they introduced the posts de Fesies, which was at first named point de France, and afterwards point d'Alesgon, from the name of the town where it was made. This lace, however, does not re-semble in any manner the point de Venies, as it forms an exception to the others; for, while in the other fibrics one single worker is required to make the richest piece. the Alencon requires from fourteen to sixteen different workers, for the smallest size, even one-quarter of a yard, and the most simple pattern. It is the only lace made with pure linen thread (handspun). This thread is worth

from 100f, to 120f, per pound All the workwomen here are extremely skilful. The open work in the lace is made in a superior style, and every day new is made of great perfection. It is the richest, the finest, and the strongest, and consequently the prices are the highest. There are in France several other manufactures of isce, but the foregoing detail will be a resume of all

This braneb of industry, one of the most important, is ery interesting, particularly as regards commercial relations, and in a moral point of view.

All the females employed in making iace carry on their work in their own houses, under the surveillance of their parents or friends, who act as their instructors.

Switzerland has largely availed herself of the benefits held out by this Exhibition, and well sustained her long-enjoyed celebrity for both lace and muslin embroidery of every description. It will be seen by the numerous articles shown (displaying at once cultivated taste and excellence of work, combined with cheapness and utility). that her motto is progression, and, as stated by one of themselves, "Under the beneficial effects of free trade the Swiss sewed-muslin trade has made enormous progress." From the variety of articles manufactured, the excellence of the work, and the beanty of the design, the manufacturers send their productions to all parts of the globe, and find ready sale, even where they are met by

Switzerland are no longer sufficient to satisfy the demand. and the Swiss manufacturers are employing large num bers in the eastern provinces of Austria, and the southern provinces of the Duchy of Baden,

It would be difficult to state the exact numbers emoyed in this branch of manufacture, the hands not being in factories or large rooms, as frequently the case in this country-the pattern being stamped or printed on the muslin or net, and given out to workers at their own homes, so that many do their household work, and fill no their time with this embroidery; there cannot, however, be less than 40,000 earning their living by this branch of industry.

A good stendy hand can earn, in ordinary times, is, er day; second-elass hands, down to children, range from 3d, to 8d, per day. The needlewomen of Appenzell Rhodes interieures) are noted as the most skilful workers in sewed muslin, &c.; heoce the finest and most difficult work is done there, and the bighest wages are received.

Those articles in which chespness is the recommen-dation, are done by the needlewomen of St. Gull, Vorari-burg, and Baden. It is estimated that 100,000 pairs of rtains alone are annually imported into the United Kingdom of Great Britain, at prices varying from 3s, to 100s, per pair, paying a daty of 15 per cent. The Swiss manufacturers do not regard England as

their best enstomer; they export largely to America (North and Sonth), Germany, Italy, Spain, and other southern countries. The trade is steadily progressing, and is principally conducted by the manufacturers of the and is principanty colourated by the manufacturers of the canton of Appensell, a few only redding at St. Gall, where they have a Wednesday's and Saturday's market for the transaction of business.

The continued care for new styles, novel designs, and chempty productions, has evidently had the effect of de-chempty productions, has evidently had the effect of de-

veloping the skill and artistic faculties of the Swiss manu facturers, as may be seen by the unrivalled excellence of some of the goods in the Exhibition.

The productions of Mr. J. J. Setters and Mr. J. U. Tannes, both of Buhler, are here more particularly referred to, as being of unrivalled excellence.

Saxony has furnished a small assortment of lace and embroidery, mostly of a manufacture peculiar to the country, being heavy, firm, and well made, but of limited sale in the English market.

SPAIN

The exhibition of lace and embroidery is limited, aithough there are some articles deserving of notice, from their richness and antiquity.

Намилен.

There is little from this place, except some specimens of embroidery with hair, displaying much taste.

We cannot say much of the articles exhibited in lace and embroidery, as they are very few, and of a class that would not suit the British market.

There is little worthy of notice from Malta. LACES OF BELGIUM.

The description of lace peculiar to this country admirahly sustained by some of the exhibitors in this department, there being a valuable display of Valenciennes edgings and laces of Mechlin, and other goods of the most costly and superb character, representing some thousands of pounds in value, evineing at once the taste and perseverance of the Belgian mannfacturers, who are finding employment for at least a hundred thousand hands annually, by the production of this description of lace, used principally by the middle and upper classes of

Belgium still retains the pre-eminence it has long enjoyed, for the perfection displayed in the manufacture of the most beautiful laces; in proof of which the orticles exhibited by Messes. DURAYON-BRUNFAUT and Co., of Brassels and Ypres, may be more particularly referred to, as also those of other exhibitors. The laces chiefly manufactured are termed Brussels, Mechlin, Valenciennes, and Grammont laces, I. "Brussels"

I. "Brussels" produces two different descriptions of lace, known as "Point à l'aiguille," and "Brussels plait." The former is made entirely with the needle, the latter is made on the pillow, and "Honiton lace" very much resembles it.

The finest and most expensive kind is made of very fine flox thread, and some of cotton. Formerly the laces were made only on the "real ground," which is made on the pillow in parrow widths of from 1 to 3 ioches, and then joined with such admirable ingenuity as to be imperceptible.

It is of the most beautiful description, being remarkably soft and clear, but so costly as to be within the reach of comparatively few persons. Hence it was only worn at

Court, and hy the most wealthy.

Trimming lace of 4 inches wide varied in price from four to ten guiness per yard: veils, from twenty-five to one hundred goiness each, and other articles were proportionately expensive; but recently, owing to the great improvement which has been effected by eminent houses in the town of Nottingham (England), in prodocing a very superior net by machinery, the lace is now manu-factured at a much less cost; the flowers or designs being made by hand, and afterwards sewed on to the "machinemade" net. This description of lace is known by the term "application of Brussels," and its resemblance to the Brassels point lace is so striking as frequently to

deceive those who possess a good knowledge of lace.
"Brussels ploit" is in considerable use in France. Spain, Russia, and other countries, and is made of most

exquisite quality.

The "Point h l'aiguille" is more worn in Eoglond:

and since the great improvements which have been made in prodocing this beautiful lace at so considerable a re-duction in price, the demand for it has become very general, and it is now worn by nearly all ladies of rank and fashion.

In the manufacture of Brussels lines several classes of workers are employed, as follows:—1. Those who moke the flowers in plait. 2. In point, 3. The real ground. 4. The ground in the flowers, 5. The attacheoses (fasteners). 6. Those who apply on the net. 7. Those who work the point, and the new kind of real Brussels, &c. (the "gase point").

With the exception of the point d'Alençon (made in the

north of France), Brussels produces the most valuable lace that is known,

11. Mechlin laces are made at Malines, Antwerp, and in the vicinity, ond are of the lightest and most beautiful texture. They are all unde in one piece on the pillow, and their peculiarity consists in a plast thread surround-ing the flowers, and designing the autline, so as to give the appearance of embroidery. This manufacture has suffered very much from the caprice of fashion Valeocieunes laces are made chiefly in the following towns, and the surrounding villages, viz., Ypres.

Menin, Conttrai, Bruges, Ghent, and Alost. Although all made in the same manner on the pillow, yet the productions of the various towns named are so

characteristic, that a person necustomed to examine them, will readily distinguish where each piece of lace was

1. Y pres excels particularly in laces of the finest square grounds, of the widest and most expensive description, varying in price from 6d, to 5sd, the English yard, This branch of industry was commenced at Ypres about 1656; and according to a census made by Lonis XIV. in 1684, there was then one lace manufacturer, and 63 workers employed. It is only since 1835, that its trade has been so considerably developed: and now it is estimated that so considerably developed; and now it is esammated than the lace-dealers of Ypres purchase the produce of about 20,000 workers living in the town and its envirous. The bulk of the lace manufactured here is exported,

principally to England, France, and Germany, and a trade

has been opened with the United States; but a great barrier to its increasing development exists in the greetly-varying duties levied upon lace by different countries

2. Mcoin provides employment for about 2,000 or 3,000 workers,
3. Brages. The mannfacture in this town has im-

mensely increased, and a considerable trade is now carried on. The laces here are of a good, useful quality, soitable for trimmings, and are much sought after by

English buyers; but the number of persons ongaged here in the making of lace is not so large as in Ypres.
4. Ghent. The fobric of this place is extremely good, and laces of all qualifies are produced, principally con-sisting of the narrow and medium widths, employing in

their manufacture about 10,000 or 12,000 persons.

5. Alost possesses very excellent workers; but the designs are not equal to those of Ypres, and the colour

of the laces is inferior. IV. In the village of Grammont great improvements have been made in white-thread lace, also in black point

trimming laces. Recently, the manufacture of piece-goods, as shawls, scarfs, berthes, &c., has been commenced, and is carried on with great success. The quality and designs are not equal to those of France, but the prices are much lower,

and these productions are now in considerable demand. BRITISH LACK.

A Council Medal has been awarded to BALL, DUNNI-CLIFFE, and Co., Nottingham (19, p. 560), for velvet and Simla lace; being new patented fabrics, suitable for shawls, dresses, and for various ornamental and nacful purposes, and of commercial importance. Also imitation Valenciennes, and white and black point tulle, of great

The Jury award prize Medals to the following :---

ATERS, W., Newport Pagnell, Bucks (388, p. 573), for specimens of wide thread-lace of good useful quality. CLARKE, ESTHER, London (130, p. 565), for o Houiton lace flounce, of which the design and quality are meenalled in its class.

FISHERS and ROBINSON, Nottingham (2, p. 559), for imitation of Valenciennes Inces, black trimming loces, and patent spot-nets, all possessing merit as machine-fluished goods; also two tamboured net shawls, with a variety of excellent black Jacquard laces and shawls of

superior merit. FORDENT, JAMES and SONS, Dublin (45, p. 561), for jacket-flouncings, scarf, berthe, and handkerchief,

imitation of old Spanish point, with specimens of Lime-rick lace. The whole unequalled in their class. rick lace. GREASLEY and HOPCROFF, Nottingham (34, p. 561),

for very superior Jacquard shawl; also flouncings and falls, together with some needlework-shawls well executed, and truthful imitations of real lace GROUCOCK, COPESTAKE, MOORE and Co., London (3, p. 559-60), for Houston guipure half-shawl, flonneings, lap-pet, and trimming-lace, of excellent design and manufac-

ture. Double-flounced dress, with court train, tamboured on fine Brussels net, elaborately worked and well designed. Very wide Buckinghamshire lace of fine quality. Embroidered muslin low and high chemisettes, collars, cuffs, trimmings, &c., of superior work.

HEALD, B., Nottingham (269, p. 570), designer, for pastern for broad lace flounce, evincing good taste and snitability of design. HETMANN and ALEXANDER, Nottingham (25, p. 560),

for machine-made lace curtains in great variety; also, plain and fancy nets, remarkable for cheapness and Howett, James, and Co., London (5, p. 560), for

guipure Honiton lace shawl and mantle of very excellent manofacture. LAMBERT and BURY, London (4, p. 560), for Limerick

lace shawl and time dress.

LENTER, T., Bedford (236, p. 568), for wide white and black lace,

MALLETT and Banton, Nottingham (29, p. 561), for imitation black trimming-lates, and Valenciennes edgings, RECKLESS and HICKLING, Nottingham (32, p. 561), for shawls, scarfs, flonnces, falls, and trimming-laces, in imitation of black point lace. Also for white tamboured shawls, scarfs, flounces, and falls. The whole possessing great merit in design, as well as in execution

RIEGO DE LA BRANCHARDIERE, E., London (17, p. 560), for basket of flowers, rock, berthe, &c., in erotebet-work;

very beantiful.

Hoannon, Thomas, Nottingham (25a, p. 560), for machine-made lace curtain of excellent quality and graceful design, exhibited by Heyman and Alexander. ROLPH, JONAS, Coggeshall, Essex (282, p. 570), for double flonnee, scarf, and berthe; the design soperior, and the work unequalled in its Class

STERGMANN, IL., and Co., Nottingham (41, p. 561), for muchine-made lace curtains of great beauty of design and general excellence

TREADWIN, C. E., Exeter (55, p. 561), for Houiton mipore flounce, resembling ancient lace; the pattern, rom Government School of Design, is particularly commended.

Viccans, R., Padbury, Bockingham (235, p. 568), for Wide thread-lace of fine quality, Vickens, William, Nottingham (33, p. 561), for shawls, scarfs, mantles, falls, flounces, and trimming of great merit in design, and for their faithful

imitation of real black point lace, and at comparatively moderate prices. WEEDON, FRANCIS, London (6, p. 560), for British point lace shawls, lappets, and specimens of flourcings; designs very good

WHITLOCK and BILLIALD, Nottingham (27, p. 560), for imitation laces; an admirable copy of the real Mechlin.

The Jury make Honourable Mention of the following Exhibitors in this department :-

ADAMS and Sons, Nottingham (21, p. 560), for thread edgings, made on the traverse warp machine, being neat and useful goods. CARDWELL, C. and T., Northampton (122, p. 560), for pillow-lace of different widths. CLARRE, JANE, Regent Street, London (18, p. 560), for specimens of lace, copies of old Spanish point; the

work extremely fine and beautiful. GILL, W. L., Colyton, Devonshire (386, p. 573), for ecimens of Honiton lace, in imitation of Spanish and Venice point,

HEALD, HENRY (295, p. 570), student of Gove School of Design, Nottingham, for pattern of half shawl in good taste.

HERBERT, THOMAS, and Co., Nottingham (38, p. 560), for imitation blondes, laces, crochet-edgings, &c. latst Work Society, London (77, p. 363), for various descriptions of lace, knitted, notted, and croebet; also, various specimens of bosiery Ktontlet, I. (123, p. 564), for pillow-lace, narrow and

Ladies' Industrial Society, Dublin (213, p. 567-8), for infants' lace-robes, imitation of Spanish point; also shawl, mitts, parasols, &c., made from the fibre of sweet pea, nettles, and honeysnekles, an application of a new interial to textile purposes, Lacohen and Cosens, London (10, p. 560), for Honi-

Sts. C. J., Belford (301, p. 371), for two pair of lappets made no the pillow, an excellent imitation of Mechlin lace; also various trimming-laces.

TURTON, SAMUEL (179), designer, Nottingbam, for a design for lace enrtain.

SCOTCH AND IRISH ENBROIDERY.

The Jury award Prize Nedals to the following subiects:-

Barg, J., and Co., 189 Regent Street, London (24 Class XX., p. 578), for embroidered shirt-fronts, tasteful in design and of fine work.

Brown, Strangs, and Co., Paisley, and 18 Watling Street, London (37, p. 562), for embroidered muslin robe, of great richness of effect and splendonr of design. Brown, S. R. and T., Glasgow (58, p. 562), for rich book-robe, short cambric frock, cambric handkerchiefs, stomachers, and collars, with other articles of great beauty, ntility, and excellence; also, a number of booknslin collars exhibited for lowness of price. Holder, J., and Co., Belfast, Ireland (1, Class XIV

p. 510), for muslin insertions and trimmings, embroidered robes, and frock bodies; also, some fine embroidery in robes and jaconot, remarkable for cheapness and effect Mair, J., Sox, and Co., 60 Friday Street, London (59, Class XI., p. 482), for three muslin robes (sewed and

tamboured), very chaste in design and of excellent work. Macrossalt, D. and J., and Co., Glosgow (66, p. 562), for embroidered muslin robe, eap, and basinet; designs very graceful, and work exquisite, being the finest sample of sewed-work in English, Scotch, or Irish embroidery. This firm also exhibit medium and wide open-work flouncings, fine broad triannings, embroidered muslin robe, high chemisettes, and many other articles of merit in design, execution, and utility.

Salomons and Sons, 42 Old Change, London (305, Classes XII. and XV., p. 501), for embroidered guipane cambric cape and handkerchief, high chemisette, and collar, work of much excellence, and great novelty in the introduction of a new guipure stitch,

The Jary make Honourable Mention of the following Exhibitors in this department :-

Brown, Huon, Glasgow (64, p. 562), for muslin floonce and trimmings, embrookered robes, and eambric handkerchiefs.

BROWN, J. R. and W., Bangor (2, Class XIV., p. 510), for embroidered mustin robe, of good work. CAPPER and WATERS, Lendon (21, Class XX., p. 578), for court suit in work, lace frill and cuffs in imi point lace. ROBERTSON and SONS, Glasgow (62, p. 562), for cambric table-cover, collars, and other useful embroidery.

BRITISH THIMMINGS AND PRINCES.

The Jury award Prize Medals to the following sub-

Bennoch, Twenthmann, and Rigo, 27 Wood Street, Chenpsida, Loudon (394, p. 574), for a variety of gimps, fringes, and cause braids, showing general excellence. Danar, C. and T., 14 Coventry Street, Loudon (71, p. 562), for a variety of silk fringes, garniture for dresses, cord and tassels, and other trimmings of taste and novelty. Evans, R. and Co., 24 Watling Street, London, (74, p. 563), for silk fringes, braids, and fancy buttons,

HAMMUNGER, ROGERS, and Co., 30 King Street, Covent Garden, Loudon (186, p. 566), for epaulettes, military hats, and embroidery suitable for regimentals, of good design and exceution. LAMBERT, BROWN, and PATRICK, 236 Regent Street, London (83, p. 563), for equalettes and laces, embroidered waistcoats, masonic emblems, church decorations, fac-simile of Bible used by King Charles I. embroidered in

gold, and coloured silks; all of great merit, UPHOLSTERY FRINCES, TRIMMINGS, AND COACH LACES,

The Jury award Prize Medals to-

BUNGS, ROBERT, 42 Bartholomew Close, London (75, 563), for specimens of gimps, tassels, and ornaments, in fine taste, and well executed. JULLIEN, sen., Tours (Indre and Loire), (1280, France, p. 1238), for specimens of gimps, fringes, tassels, ornaments and glass frames, formed of silk rope, very taste-

fully and well executed LEES, R. and Co., 36 King Street, Cheapside, London (79, p. 563), for printed mohair velvet, of very handsome design and well executed.

SCHAESEF, R., Brieg (118, Prussia, p. 1055), for a large sortment of coach laces and trimmings, possessing a bigh degree of excellence in design and execution,

The Jury make Hononrable Mention of the following Exhibitors:-

ELLIS, SOPHIA A., Ireland (159, p. 566), for specimens of tatting in collars, berthes, chemisettes, &c., of very fine quality. GUILLENOT BROTHERS (251.France, p. 1188), for coach

and livery laces. Hannison, T., London (85, p. 563), for altar-cloth and eashions of crimson Genoa velvet, embroidered in gold,

KINGSBURY, LOUISA, Taunton (225, p. 568), for a basket of flowers, &c. ONION, E., Birmingham (56, p. 562), for an assortment

of good fringe, tassels and ornaments.
Puzza, Beamont Depot (1414, France, 1244), for face and trimmings for carriages, and livery laces, extremely good.

STANDBING and BROTHER, Manchester (239, Class XXIX., p. 802), for a good assortment of braids, laces, plaited lines, binding plain and figured, and fringes for dresses. WESTHEAD and Co., Manchester (275, Class XXIX.

p. 816), for a good assortment of tapes, and binding of various kinds, liues, &c.

curionaly-embroidered shirt,

BENKOWITS, MARIE, Vienna (389, Austria, p. 1029), for embroidery of erape thread on white silk, representing Beneficence. An embroidery of wool and ailk, representing the Grave of the Fallen Soldier.

The Jpry make Honoprable Mention of-

BAUHOFER, F., Vienna (388, Austria, p. 1029), for the arms of England embroidered with gold and silver, well executed. Kaicki, E., Vienna (263, Austria, p. 1019), for a piece of embroidery, the arms of England in gold, silver, and

silk, well executed. RUSSIA.

The Jury make Honourable Mention of the following Exhibitors:

SHEKHONIN, ALEXIS, of Novgorod (275, Russia); Prize Mednl, Class XX., p. 1375). POPUNOFF, SOPHIA, of Tiffis (310, Russia; Prize Medal, Class XX., p. 1376).

NAKHITCHEVAN, Town of (274, Russia, p. 1373). All for a number of articles in leather embroidered with gold, adapted for caps, slippers, boots, &c., with many other articles possessing both novelty and excellence,

SARDINIA

The Jury make Honourable Mention of— Thomana, F., Genon (49, p. 1304), for several em-broidered cambrie handkerebiefs.

The Jury make Honourable Mention of Saras and Rangos, Athens (56, p. 1406), for embroidery in gold.

NEEDLEWORK AND EMERGIDERY.

The Jury award the Prize Medal to the following Exhibitors:

FAUDELL and PHILLIPS, London (165, p. 566), for abroidered hangings for a state bed, showing various kinds of embroidery in the curtain drapery, tester, and coverlet. The panel in the foot-board is a copy of the "Aurora" by Guido, very finely executed, from a drawing: for the centre of the head-cloth, a medallion finely worked from a cast, being a successful copy of Thorwaldsen's " Night."

HOLLDSWORTH, JAMES, and Co., Manchester (64, Class XIII., p. 506), for embroidery by machinery on cloth Sext, G. (Prussia, 657, p. 1086), for ornamental arti-

eles, and pictures in hair, most artistically executed. The Jury make Honourable Mention of the following:-

GRUNTHAL, Berlin (166, Prussia, p. 1057), for Berlin patterns for needlework Harrase, E. and G. London (195, p. 567), for a table-cover embroidered on new silk canvas, the inven-

tion of the Exhibitor; also three small pictures in teptstitch, finely executed. HELESONNER, R., London (199, p. 567), for specimen of a new style of needlework, of good design, and well

executed, Jackson, C., London (84, p. 563), for oppliqué em-broidery, forming the top of a table; well worked, and in good taste.

JANCOWSKI, W., York (48, p. 561), for a small picture roidered in tent-stitch, extremely well done. MEE, CORNELIA, Buth (51, p. 561), for banner screen, fings of all nations, well arranged and executed; embroidery suitable for borders to curtains or portières, the flowers well arranged and well coloured,

NEIE, F. W., Berlin (Prussia, 168, p. 1057), for Berlin pattern for needlework Paner, C. F. W., Berlin (169, Prussia, p. 1057), for a needlework carpet, of good design, and well executed.

PURCELL, FRANCES, London (88, p. 563), for an embroidered table-cover, tastefully designed and coloured, and exhibiting different kinds of needlework. Schlevss, H., Berlin (160, Prussia, p. 1057), for specimens of embroidery

SOMEGREELD, R., Berlin (173, Pressia, p. 1057), for an ssortment of needlework and embroidered articles. Topy, A., Berlin (171, Prussia, p. 1057), for Berlin patterns for needlework.

CARPETS. In reviewing the existing state of the manufacture of

in reviewing the existing state of the manifesture of carpets, the first specimens that claim our intention are those from India, Persia, Turkey, and Tunis. However great may be the differences in quality amongst the carpets from the countries mentioned, they are all made upon the same principle, and that one of great simplicity; hot which yet affords the means of

producing a more perfect, beautiful, and durable descrip-tion of carpeting than any other mode of manufacture more recently discovered or introduced. The manufacture is not carried on in any large establishmeets; but in pastoral districts, where it is com-hined with occupations of that nature, and engages a

portion of the time of the families employed in that

The bom consists of two perpendicular pieces of wood,

fixed at some distance apart, which support a beam or roller; at the top, upon which the warp or chain is wound, and about 2 feet from the floor, is another similar

beam, upon which the carpet is rolled as it is made. The work is done entirely by hand, and each tie p across the face of two warp threads round the back, and

servos the face of two warp threads round the loce, and has the ends drawn up between them.

When a row of the book of the control of the control of the control of the face of the book of the control of the face of the control of t

can be copied with great accuracy.

The design and colours of several of the carpets from India, Turkey, and Persia, are especially worthy of notice, and should be studied with a view to imitate their beauties by the manufacturers of other countries. There is one carpet from Cashmere, sent by Gholas-Stsoll to the Exhibition, made entirely of silk, that cannot be too highly praised for the beauty of its texture, and the softness and harmony of its colouring. In this carpet there are at least 10,000 ties in every square foot. There are other specimens of carpets of small dimensions, but very beautiful, and remarkable for richness and harmony of colours. The exceptions are where an attempt has been made to copy European designs; and there the failure is as great as is the success in those of the native

eastern style. The carpets from Turkey deserve especial notice, as there are, in addition to those made all in one piece, some in breadths, extremely well coloured and closely woven; and an attempt has been made at new designs with considerable success. The carpets from Tunis and Algiers are made upon precisely the same principle, and have the same peculiar character in colonring and design,

The most costly and magnificent carpets of Europe are and that large and beautiful earpet, sent from the manu-factory of the Gobelins to the Exhibition, is unde by the same process of weaving as the ordinary Turkey earpets; same process or wearing an our orannary in before a sho are those from Tonrnay, in Belgium; Deventer, in the Netherlands; Aubusson, in France; London, Wilton, and Millbridge, in Great Britaio. The manufacture at Aximister in Devonshire, and Mirfield in Yorkshire, of Aximister in Devonshire, and Mirfield in Yorkshire, of the control of this description of carpet, generally called "Axminster, ceased to exist about twenty years ago,

The chief seat of the carpet manufacture in France is the department of Creuze, at Aubusson, Felletin, and Manrissard, where there are probably not less than 5,000 persons engaged in the manufacture of carpets and

with the exception of the kind referred to, when describing the carpets from the east, the Aubusson carpets are all made upon the same principle as tapestry, and are consequently too expensive to be purchased by any hut the rich. The specimens of Aubusson tapestry and carpets exhibited by Mons, Sallannsoure DE Lanon-NAIX (1469, France, p. 1246) are especially worthy of notice, being second only to those of the Gobelins and Benuvais. Their merits are not recompensed by a Medal, in consequence of M. Sallandrouze de Lamornaix, as Commissioner for France, having withdrawn from competition.

The manufacture is well represented in the Exhibition, and deserves, for its beauty of design and ecolours, the highest praise. There is a considerable demand for this manufacture by the noble and wealthy of European nations, and occasionally by the United States. At Turcoing, Nismes, and Amiens, the carpet manufacture is also carried on; there being at these three towns nearly 600 looms; and the production is increasing. One of the festures of the Exhibition is the progress made by France in the mannfacture of moquette or velvet-pile carpets. This branch is of recent introduction in that country, dating within the last twenty-five years; and the specimens exhibited by Meson, Richtmatar, Rocenta, and Concepters, (143), and remains the contraction of the

SIER HAOTHERS, of Nismes, are very good. The same manufacture is adapted for foors or for covering farniture; hat fur the latter purpose, it is made very fine to imitate tapestry, with a velvet surface.

Moquette, Wilton, or velvet-pile, and Brussels ea

are all woven upon the same principle; the only differ ence being that in Brussels the wire, by which the pile is raised, is drawn out, and in velvet cut out by a knife. The pattern is formed by having frames placed over each other, and filled with bobbins of worsted, each frame

having for the ordinary width 260 bobbins.

The manufacture of Brussels carpets was first introduced at Kidderminster, about 90 years ago, by workmen brought from Tournay, and has been steadily increasi up to a recent period, when the introduction of Whytock's patent tapestry carpets, together with two other descriptions of carpet, put a stop to its further extension. It cannot be said, huwever, that the manufacture has been superseded to any extent, as nearly the same number of ens continue to be employed.

The colours in each frame are different, and some of the frames are striped, or planted, as it is technically called, with various colours, when the design to be executed requires it, as in flower potterns, and drawn up by the Jacquard machine now generally used, instead of the old mode of drawing up by hand,

The number of colours, or shades of colour, that can be used in a line is limited to the number of frames of worsted, which rarely exceed five in England, but more frequently extend to six or seven in France. Within the last 20 years, three new kinds of carpet have been in-veoted, and brought into extensive use in Great Britain,

all of which are well represented in the Exhibition,
The first in order is Whytock's Patent Tapestry, which has been brought to great perfection within the last five or six years, and now employs about 800 looms, which are not adequate to supply the existing demand. The peculiarity of this manufacture is the unlimited number of shades or colours that can be introduced, so that the most chaborately-cotoured designs, with flowers and scrolls, can be executed. The saving of worsted is also very important in an economical point of view. The appearance is the same or similar to Brussels earpet, but the manufacture is more simple, each thread being coloured sepa-ntely, at spaces, with the various shades as they follow each other in the design. The process by which this is accomplished is beautifully simple and ingenious, but requires much care in placing and arranging the threads, and putting them on the beam. It is also necessary to the economy of this manufacture, that a large quantity of

each design should be made. This invention was patented about 18 years since, and a renewal of the putent granted for a further term of five years, which expired on the 8th September, 1851.
The specimens exhibited by Mesers. HENDERSON and WIDNELL (p. 567), and Mesors Crossler and Sons (p. 565), show in an eminent degree the capabilities of e manufacture as regards design and colouring. The next is the "Patent Axminster" of Templeron &

Co., of Glasgow, (p. 565) of which there are some excel-lent specimens exhibited in carpets, rugs, and table-covers. The object of this invention was to give the beautiful appearance of Axminster, or Tournay, at less cost; and it has been very successfully and extensively applied to the manufacture of rugs, as well as curpets.

The last is a description of carpet, having the same appearance as Brussels, or tapestry, which is woven plain by steam power, and afterwards printed by the same

It is woven at Rochdale hy Bright and Co., under Sievier's patent, and printed near Macelesfield, by Burch and Co., by a machine invested and patented by Mr. Burch. This manufacture has already found large sale, more especially for exportation

Another novelty in the Exhibition is a carpet, rugs, and hangings for walls, of patent wool mosaie, the carpet

The rapid extession of the carpet mannfacture in Great Britain is proved by the fact, that within the last seven years, not less than 700 additional hand-loness have been put in operation, for one of the new fabrics referred to; and loons worked by steam-power, equal to the production of 300 hand-loons for another, without lessening the demand for former fabrics, being an increase of full

30 per cent. in seven years.

Not only has the bome consumption greatly increased, but new foreign markets have been opened, and old ones extended.

Several patents have recently been taken for the application of steam-power to carpet wearing, in addition to that referred to of Sieviera, and no doubt now exists of this having been successfully accomplished; at all avents, for wavning patent tapestry carpets, if not for Bransels of price, and, counciperally still further attinuate consumption. In fact, there is scarcely any branch of our mannfactures that wears a more promising supper for the

future.
The principal seat of the carpet manufacture is Kidderminster, in which there are about 2000 looms, chiefly occupied in waving Brassels carpets; while the earpets called "Kidderminster" are made extensively in the neighbour/hood of Glasgow, Kilmarnock, Bannockburn, neighbour/hood of Glasgow, Kilmarnock, Bannockburn,

and Aberdeea.

They are also made in Yorkshire, Durham, Lincolnshire, and Westmoreland; the largest carpet manufactory in Great Britain being at Halifax.

The number of looms of all kinds may be estimated at 4000, and the value produced at upwards of 1,000,000L sterling.

The average earnings of the operatives will vary from 16s. to 28s. per week.

The specimens of carpeting from Austria, Portugal, Sardinia, and Prussia, show that the manufacture is

making progress in those countries, and is evidence of a growing taste that must ultimately lead to a large increase of consumption on the Continent of Europe.

The numerous exhibitors of Bertin work and their contributions, show that this is still a fashionable occupation among our fair country women, and in addition to those who follow it for anusement, affords employment to

and a large number of females.

Some of the specimens exhibited are very beautiful; in fact, every description of needlework may be said to be well represented in the Exhibitium, and one specimen worked from a cast, and another from a drawing, without the aid of ruled paper, exhibited by FAUDLL and PHILLER.

are especially worthy of notice.

A specimen of tapestry by a lady (Mrs. Alderson) is also highly creditable to the taste and ingenuity of the exhibitor.

exhibitor. The contributions in embroidery of various kinds from India, Turkey, Tunis, and Persia, are extremely interesting, beautiful in tacte, and displaying the highest degree of excellence in execution.

SCPPLEMENT.

SINCE the Jury closed their labours and separated, some specimens of Brussels and ent-pile carpeting, that merit particular statention, have been placed in the Exhibition by Mr. Biorlow of the United States, and hy Mr. Faverry of Kilderminster, as well as hy Measrs. James Hurwarans and Sous of Kilderminster.

The specimens of Brusse carpeting cabilities by Mr. Bigglow, are worten by a power Jonon increated and Righdow, are worten by a power Jonon increated and wovers thus any hand-leons good that have come under the notice of the Jury. Task, however, in a very small control of the Jury. Task however, in a very small control of the Jury and the procedure diseased in substituting stame, power for manual labour in the manufacture of the procedure of th

culty, as well as of great commercial value, must be awarded to a native of the United States.

askeded to a native of not a larged value.

In this country, and two manufactures are preparing under different patents to weare Whytock's parent tapestry carpeting by selection-power. This, however, is much expected to the control of the parent patents to weare Whytock's parent tapestry carpeting by selection-power. This, however, is much selection to the parent
took to norvantage wound result from it. The error of this opinion is demonstrated by Mr. Bigelow, whose foom will wave 20 yards per day on the average, including toppages, and requires only the attended of the extraction of the average only fire yards per day, and requires on the average only fire yards per day, and requires in addition to the waver, the assistance of a bey or girl to draw out and put in the wires by which the pile is raised.*

raised.*
Hesides the great economy in labour, there are other advantages. The goods are woven with more perfect regularity, and by means of an invention for weighting the bobbias equally, and at the same time more heavily, the tension of the worsted being thereby increased, a smoother and more even surface is produced, and by the same means a suring in the material effected.

same means a surrigi to the material elected.

There are in the United States, 28 of Mr. Bigelow's looms at work upon five-frame Bruss-els carpeting, 50 upon tapestry carpeting, and 450 upon ingrain carpeting (as it is called in the Uoited States), the same description being called Scotch, Kidderminster, or super carpet, in

this country.

The invention of Mr. Fawcett is of a different nature, hat also important in its results. In Bigelow's, the main feature is a saving in the cost of labour, in Fawcett's a saving of material. The specimen exhibited is cut-pile, but there is little doubt of the principle being applicable to Brussels carpeting also.

As Mr. Fawcett has a patent in progress, the results only and not the mode by which they are obtained are here noticed.

here noticed.

In Brussels carrys made with five frames of recruce, in Brussels carrys made to the surface is a 5 to 8, and in cuylar of a verage quality as 6 to 8 of the whole quantity used.

By Mr. Favestir mode of waving, the very important saving of one half of the worsted that is at the back of the expet is effected, without diministing the quantity when the carryet is effected, without diministing the quantity what closper; and another devantage is, that two-frame will be worse as swill as five upon the method-in third in the property of design, and the introduction of soil the improvement of design, and the introduction of soils.

tional colours to give proper effect to them.

There is little doubt that Mr. Bigelow's loom can be applied to Mr. Fewcett's invention as well as that of Measrs. Humphries and Sons' improvement, and these two plans combined will produce a much more beautiful fabric than has hitherto been made, at a greatly diminished cost.

The Jury of Class XIX., coujointly with that of Class XXX., have awarded the Government Manutacrous or Gonetin and Bearware Tarsure (1808, p. 1241) the Council Medal for the originality and beauty of design of the different specimens exhibited for furniture, and the extraordinary excellence of execution of most of the productions exhibited.

The Jury award Prize Medals to the following subjects:-

BRAQUENTÉ and Co., Paris (435, France, p. 1199), for

 To prevent misapprebension, it is perhaps necessary to state, that the ingentions invention of M. Sievier, for weaving carjets and other terry fabrics scibbout a wire, is in extensive operation for the manufacture of the plain fabric to be printed in the piece. Auhusson carpet, tapestry, portières, and table-covers; good designs, colouring, and execution. Bainton and Sons, Kidderminster (110, p. 564), for ecimens of patent tapestry carpet, velvet pile, and

Axminster rugs.

Azminster rugs. Bencat, J. and Co., Crag. near Macclessfield (118, p. 564), for specimens of velvel-pile and Braussic carpent, p. 564), for specimens of velvel-pile and Braussic carpent, p. 564, for specimens of velvel-pile and Braussic carpent, p. 564, for specimens of Craussic, (82, p. 564, for specimens, p. 117, p. 564, for specimens of Braussic August (158, p. 564), for specimens of Braussic and velver-pile carpets.

The design is unique and well coloured, the style mediseval. CROWLEY and Sons, Halifax (142, p. 565), for the

great beauty of their patent wool mosaic rugs and table-covers, in design and colours, and also their perfect exeeution. For the design, colours, and execution of the carpet of the same manufacture, and also for its being the first large curpet ever made upon this principle, and for the designs and colours of the specimens of Whytock's patent tapestry carpets.

patent tapestry carpets.

Disculsons, A. F., Berlin (175, Prussia, p. 1057), for soft carpets well designed and executed, and for cloths.

Dovg, C. W., and Co., Leods (155, p. 565), for specimens of five-frame Brussels carpet, of good bold design, and well coloured; also a specimen of five-frame tweethers, of good design and cultural five-frame five-

fine quality; carpets of the same manufacture, in initation of Smyrua carpets; velvet-pile carpets, centre design and bordered

PARDOE, HOOMANS and PARDOE, Kidderminster (263, PARTY AND THE PROPERTY OF THE

1244), for moquette, or velvet carpet, excellent in design and colours; also fine moquette for furniture, and Anbusson tapestre SHITH (TURNERVILLE), BOYLE, and Co., 9 Great Marlborough Street, London (318, p. 571), for patent tapestry carpets, excellent in design and execution.

TEMPLETON, JAMES, and Co., Ginsgow (315, p. 571), for several patent Axminster carpets of good designs, and well coloured. Also rugs and table-covers of the

VICTORIA FRAT CARPET COMPANY, LOVE Lane, Wood Street, London (327, p. 572), for a specimen of printed

felt carpet, combining utility and cheapness.

Warson, Bell, and Co., 35 and 36, Old Bond Street, London (337, p. 572), for Axminster carpet of first-rate quality, good design, and well executed. Bordered Brussels carpet, of Persian design, with contre, extremely good and well coloured

WHITWELL, J., and Co., Kendal (345, p. 572), for specimens of Kidderminster carpet, and twilled Venetian carpet of great utility and cheapness, well designed and ured.

WRIGHT, CREMP, and CRAME, Kiddermin p. 573), for a velvet-pile bordered carpet, five-frame; a Brussels carpet, Persian design; a Brussels carpet, shades of crimson and oaks, &c.

ZCFFINGER, T., Wacundorf, Canton of Zurich (Switz-erland, 209, p. 1280), for his invention in weaving chenille into carpeting, by which the ontline of the design is more correctly given.

The Jury make Honourable Mention of the follow-

BROWN, M'LAREN, and Co., Scotland (114, p. 564), for specimens of velvet carpet, and three-fly Scotch carpet. DAUTRIAS, B. and Co., Portugal and Madeira (853 and 881, p. 1315-16), for two very good specimens of Kidder-

DUCKEL and Son, Amiens (France), for a moquette rpet, centre design and bordered Haas and Son, Vienna (Austria, 619, p. 1038), for a

considerable assortment of moquette carpets; good both in colours and design. HENDERSON and Co., Durham (200, p. 567), for very

good specimens of damask Venetian carpet, and velvetpile stair-carpet, H:MPHRIDS, THOMAN, Kidderminster (210, p. 367), for a seven-frame velvet-pile carpet, of good quality and design, and well coloured.

LADIES' CARPET NEEDLEWORK (379, p. 573), for the design by Mr. Papworth.
Lanoger, Sons, BROTHERS, and JAQUEMET (904,

France, p. 1223), for Anhusson carpets of good design and colouring. LAWRANCE, A. and A., and Co., United States (453,

p. 1464), for a specimen of Kidderminster carpet of excellent quality.

LECUN and Co. (1306, Prance, p. 1239), for Tapis

Ecossais, good in quality and design Monron and Sons (252, p. 569), for several specimens of velvet-pile carpets. NEWTON, JONES, and WILLIS, Birmingham (258, p.

569), for specimens of church carpets and hangings, and episcopal robos. RET BROTHERS (35, Sardinia, p. 1303), for specimens

of thick coarse carpeting, of good designs. Sencox, G. P. (London and Kidderminster) (502, 571), for specimen of three-thread Brussels carpet, exhi-

ted for cheapnes Wilson, J. and W., Scotland (331, p. 572), for speci-mens of Kidderminster (or Scotch) carpets. Woodward, B. Hiootins, Kidderminster (354, p. 572), for five-frame Brussels carpet, centre design, and bor-

dered, with other specimens. Floor-cloths.

The Jary award Prize Medals to the following Exhi-

ALMO and Horr, Elinbeth Torn, Nex Jersey (Taited States, 182, 1849), for specimen of floor-ce and the state of the state of the state of the Bencemany and Soos, Berlin (164, Prussis, p. 1057), for printed molenkin table-covers, floor-cloths, and painted window-binds; a very large and good assorment. Hars, Jours and Ca, Bristol (196, p. 866), for four large specimens of oil-cloth, the designs, colours, and qualities of which are first rate.

Jones, Jun., Brussels (306, Belginm, p. 1160), for printed moleskin table-covers, of great variety and cheapness; floor-cloths, and waterproof fabrics of great excel-

Lr. Crossier, - (1305, France, p. 1239), for table-

covers, varnished and printed, on cotton, moleskin, imitation patent leather, and imitation flock. ROELLER and HUSTE, Leipzig (161, Saxony, p. 1111)

for painted table-covers, and floor-cloths; generally good in designs and well executed. Sain, J. A., Strusbourg (1009, France, p. 1227), for enamelled floor-cloth, waterproof fabrics, toiles and cotton; excellent in quality,

The Jury make Honourable Mention of the following:-

BARNES, R. Y., floor-cloth manufacturer (95, p. 564) for three specimens of oil-cloth, well designed, and good tapestry. in quality and colours. BISIEUX, Paris, (767, France, p. 1217), for oil-cloth,

painted imitation of marble and wood on moleskin. INN, FERDINAND (46, Grand Ducky of Hesse, p. 1128), for printed and painted moleskin table-covers, of good

designs, and well executed. LEHRANN, M., Berlin (Prussia, 167, p. 1057), for painted moleskin table-covers and floor-cloths, of great variety.

SMITH and HABER, London (371), for one large speci-

men of oil-cloth. In concluding the Report accompanying the decisions of the Jury, I have to acknowledge the kindness of-

Robert Lindsay, Belfast, for that portion relative to the Irish and Scotch embroidery. D. Hiddle, Oxford Street, London, for English and Belgian hand-made lace.

Felix Aubry, Paris, for French lace and embroidery.

- Faessler, London, for Swiss embroidery.

P. Graham, London (Vice-Chairman), for carpets and

JUROSS.—The following Exhibitors being upon the Jury, all notice of the articles exhibited by them has been omitted:-RICHARD BIRKIN, of Nottingham, machine-made lace. D. Bippia, of London, hand-made lace.

P. GRAHAM (Jackson and Graham, London), carpets.

RICHARD BIRKIN, REPORTES,

Tux extreme variety of the articles submitted to the inspection of this Jury rendered it a task of no small difficulty accumpantly to appreciate them; and when it is remembered that textile finites, or other asbitances suited in the state of the world, wrought up into "articles of descent" or personal use," suited to the bahits of the various nations of the world, with the property of the second of the property of the property of the property of the second of the property of the inspection of this Jury rendered it a task of no small have responded to the invitation, and have sent very valuable, and in many instances highly suggestive, con-tributions to "The Exhibition of the Industry of all Nations."

JOHN BAPTISTE SOLDI, Southwark,

HOSTERY.

In 1589 the hosiery knitting trude originated, through the invention of the stocking-frame by the Rev. W. Lee, at Nottiegham. It is carried on in Nottighamshire, Derbyshire, and Leicestershire, at Godalming, and at Tewkeshary, in England; at Balbriggan in Ireland, and at Hawick in Scotland; at Chemnitz and its neighbourhood, Hawrick in Scotland; at Chemnitz and its neighbourhood, in Saxony; at Paris, Gauges, Arignon, Ornape, &c., in France. Stocking frames are spread over almost every district of France, Spain, Netherlands, Germany, and Italy: these serve for the production of hosiery, chiefly used in the neighbourhood if the machines. Goods for sale, knitted by hand, are made in Kendal, Aberdeen, and the Shetland Isles, &c. England exports all kinds of and the Shetland Mos, &c. England exports all kinds of honeity; Pirasse chiefly alls hoisety; Saxon exports are for the most part low-priced coston and woolden hosiery. According to an actual custom that they fair. W, Felkini, of stocking-frames in the United Kingdom. The assumal return from them ass. 24,555,004, on three books of the consistent of 305,000d, imported raw materials, and dou,000d, for finishing and predist. Wages were then all the control of the control of the control of the State of the control 35 years. Since 1844 the number of machines has been

increased to at least 50,000; raw materials have advanced 30 to 50 per cent, wages have risen about 40 per cent,; and profits have accumulated in proportion. The returns of the hosiery trade of the United Kingdom in the last year were probably about 3,500,000/,; and it is satisfactor, to have to state that the average trade. factory to have to state that the export trade is extending nacroy to have to state that the export trade is extending to all parts of the world; but the chief increase in de-mand has been for home consumption, amongst the most numerous classes of the community. The number of English hands employed in this manufacture, either con-stantly or as an addition to domestic duries, is, when trade is good, about 100,000, consisting of a nearly equal num ber of each sex. Until a few years since, frames were entirely worked by hand in the dwellings of the artisans, entirely worked by hand in the dwellings of the arrisan. They are now shotly collecting into Reinches, in a few of they are now shotly collecting into Reinches, in a few of rotary frame stands in the Depthi compartment of Manney in Montin in the Fibblichian qualitation of the state of the s 75 to 100 dezens of small women's hose. A specimen of these hlenched cotton stockings is in the Exhibition, ready for the market. This is certainly one of the most remarkable instances of the power of improved machinery to cheapen production ever seen. The lowest price of English cut-up cotton hose made from the old wide frame. which is shown in the Exhibition, is 3s. 7d. per dozen, weighing 173 ozs.

The colours dyed in Nottingham do not generally equal those of the coloured cotton and silk goods dyed for the London, Manchester, and Coventry trades. This deserves the serious attention of the dyers and manufacturers in

that locality. Improvement is certainly practicable, as there is water in the district well adapted for securing brilliancy of colonr. The bleach and finish of Notting-ham cotton hosiery is unequalled. Leicester hosiery is surprisingly diversified in colour, shape, and adaptation of the articles to every market. One house sends to the Exhibition specimens sufficient to represent fairly their own production, comprising 12,500 articles with prices, employing about 4000 hands, and distributing about 1400 weekly in wages. This spirit of adaptation and improvement in machinery, and diversifying its products to suit the wants of the world, pervades the Leicester trade, and has resulted in the population of that borough being quadrupled in 40 years, having risen from 16,000 to 64,000. No means are available for ascertaining the extent of hosiery production in France. French cotton hosiery is generally of uneven materials; but their silk hosiery is of superior materials. The machinery is in less perfect order than that of the English. The eneven-ing of their embroidered hose is very beautifully designed and executed. In the Saxony Catalogue of goods in the Exhibition, their machines are stated to be about 30,000, employing 45,000 hands. Their lowest specimen of cut-up small women's hose is at 3s. 6d. per dozen, weighing 181 ozs., half hose 1s. 10d., and cotton gloves 1s. 6d. per zen, all made no doubt with a view to exportation, This trade has been remarkably rapid in its progress, having risen from a trifling amount to its present extent within the present century. Saxony hosiery, as compared with English, is, from the machinery being too often in an imperfect state, liney, short-looped, and therefore fiver for gauge; but less clastic and less durable, from the same cause. There is less substance in hand than, from the actual weight of materials used, there ought to be, the actual weight of materiaus steel, there ought to be. The materials are less even in quality than those em-ployed in the English trade. Honourable Mention has been occasionally spoken of in the following recommend-ations, as suitable for the meritorious workpeople referred to, and in a few instances for exhibitors who have sided the completeness of this Class. It will be observed, that no recommendation is offered for the Council Medal. The Jury do not think any of the productions exhibited present originality or inventive power justifying the award of that medal. But the merit of promoting excellence of quality, diversity of metal products, low prices of goods mitable for the mass of consumers at home and for exportation, and consequent increase of employment, has been eminently exhibited in this Class.

The Jury award Prise Medals to the following Exhibitors, and for the subjects indicated :-

ALLEN and SOLLY, Nottingham (100, p. 583), for sound and well-made articles, and a selection showing the im-provement in the hostery trude, especially in the materials sed at the dates 1700, 1790, 1804, 1810, 1812, 1815, 1826, and 1848.

ANGRAVE BROTHERS, Leicester, Manufacturers (202, 588), for drawers and shirts of excellent quality. Broos, H. W., and Sons, Leicester, Manufacturers (203 p. 588-9), for the general excellence of the specimens of siery, adapted to every market where worsted and lowpriced cotton stockings, gloves, and woollen shirts are in

BILLSON and HANES, Leicester, Manufacturers (201 p. 588), for the excellence in quality of Thibet wool, and a great variety of socks. CARTWRIGHT and WARNERS, Manufacturers, Leieester (196, p. 588), for worsted yarns prepared by them from Meriuo and Vigonia wools, and for general excellence of

the articles manufactured therefrom COCHOIS and COLIN, 7 Rne des Déchargeurs, Paris, France (124, France, p. 1177), for good quality and em-Pay, J., Godslming (193, p. 588), for Lisle thread ho

of excellent make, and very regular materials, and for well-finished Segoria goods. GLAISER, J. S., jun., N. Chemnitz, Suxony (72, 83, p. 1108), for women's coloured cotton gloves. Hausis, R., and Soxs, Leicester, Manufacturers (198,

p. 588), for an extensive collection of examples of horiery

of every kind, adapted to the most varied markets, for superior excellence in production, alike as to pattern, colour, and finish, and as a recognition of the ence ment of inventions and adaptations of machinery in the anufacture of bosies

HOLLAND, T., and Co., Godalming (194, p. 588), for fleecy hosiery, having special reference to medical uses, and the comfort of invalids, and for Merino and Segovia

goods of the most superior quality. Hunsr and Sons, Nottingham (99, p. 583), for the excellence of a general assortment of articles suitable for the

bome and export trade. LANDGRAFF, GOTTFRIED, Hobenstein (Saxony, 72, 83, p. 1108), for women's single-thread cotton-hose LAURET BROTHERS, 19 Rue des Mauvaises, Paris, and Gauges (903, p. 1223), for embroidered silk-bose of very

high quality; also for embroidery in colours and general excellence of production. McDougall, D., Inverses, Scotland (83, p. 582), for knitted hosiery, &c., and as a recognition of his efforts to create habits of self-dependence and a love of labour amount the pensantry of the Highlands of Scotland.

The Jury consider that this exhibitor is entitled to this distinction as much for the superiority of the articles he exhibits, as in consideration of the circumstances under which they are produced. The peasants of Argyllshire, Ross-shire, &c., are afforded employment in knitting while attending flocks, and during other desultory employments. Cotters, once half starved, he states, now possess money, thus earned, placed in the savings-banks. The wool is tions earned, placed in the savingst-banks. The wool is cleaned, combed, and prepared by the possants; dyed by themselves, where colours are desired; brown, from a lichen called crotked; yellow, from the tops of young heather; black, from alder bark; lemon, from furze flowers; and olive, from the roots of the water-lily. All flowers; and olive, from the roots of the water-lily. All substances are at hand and well known to them, Stockings and socks of various patterns and qualities, thus knitted from home-dyed or self-coloured wools, are exhibited, as well as pieces of Tweed woven from the same materials. This exhibitor pays 300d, to 500d, per annum for socks alone; and all this class of products are exported to Hong Kong, Shanghal, and other distant parts, at from 12s to 24s, per dozen pairs, besides being used in Scot-land Itself somewhat extensively. The Jury desired to have recognised the first preparer and dyer of wool, together with the best and most thrifty knitter, had it been

possible to have ascertained this with accuracy.

McKexzie, W. B., 126 Prince's Street, Edinburgh (142. p. 585), for Shetland knitted shawls and hose. The former are of very fine materials.

Mainer Browners, Oelsnitz, Saxony (72, 83, p. 1108), for woollen shirts of excellent make and good colour, for exportation.
MEXECUTE and Sons (639, France, p. 1208), for extra fine white embroidered silk-hose, and excellence of ankle

embroidery in colours.

Milius, S., Bunhill Row, London (89, p. 582), for an extensive collection of articles of dress. MILON, P. D., sen., 98 Ruc St. Honoré, Paris, France

(930, France, p. 1224), for superior workmanship of hose, and for excellence of embroidery.

Montary, J. and R., Nottingham and London (101 p. 583), for great excellence in the manufacture and finish of silk and cotton hose, suited to the best demand of the London and other markets, and for slik gloves of superior make, colour and finish. The exhibitors send from the coarsest to the finest ganges in silk and cotton hose, the latter requiring a considerable magnifying power to discern the loops, and though a dozen of the silk hose weigh only 34 or., they are perfectly made in quality, and of the most regular materials. The silk in each pair cost 1s. 3d., the workmanship 15s. NACKE and GENERABECK, Chemnits (72, 83, Saxony,

p. 1108), for women's ent-up white cotton hose of fine NETHER, P., Chemnitz (72, 83, Saxony, p. 1108), for white and brown cotton hose, adapted to exportation from

their low prices. NEVILL, A., and Co., 121 Wood Street, London (20, p. 578), for excellence of production in ladies' underof housery.

clothing, to fit the shape, and gentlemen's pantaloous and drawers of similar character; also for excellence of quality and make of Saxony wool sbirts, and hose manufactured for the Spanish and other markets.

factured for the Spanish and other markets.

Solbato, F., Chemnitz (72, 83, Saxony, p. 1108), for adaptation in price to export demand in certain qualities

Tayloa and Co., Rochdale (127, p. 587), for plushes mannfactured from waste silk, and the use of that material, which is of comparatively small value for the mannfacture of articles of general utility.

THRESHER and GLENNY (79, p. 581), for a fahric for under-clothing in warm climates. THURMANN, PROOTT, and Co., Nottingham (92, p. 583),

THERMANN, PROOTT, and C.D., INDAMIGNAM, AND PROPERTY OF THE ADDRESS OF THE ADDRES

Wand, Sturt, Sharp, and Wand, Belper, Derbyshire (195, p. 588), for examples of nearly every class of stockings and gloves, made from silk or cotton yarn, of great excellence, whether as to make, colour, or finish, or adaptation to various markets; and also for the lowest sample of cut-up hose in the Exhibition.

WEX and LEMDER, Chemita (72 and 83, Saxony,

WEX and LINDNER, Chemnita (72 and 83, Saxony, p. 1108), for hosiery of great excellence, sultable for general use.

Wilson and Son, Halbriggan, Ireland (183, p 587), for excellent thread basiery, with lace fronts.

The Jury make Honourable Mention of the following Exhibitors:—

Human Louis Leigester Manufactures (2017 p. 500)

Hiddle, John, Leicester, Manufacturer (297, p. 589), for warp in hares'-fur, and Saxony wool goods, spun silk, eloth, hares'-fur gloves, and Vicuán wool articles. Coman, H., and Soxa, Leicester (208, p. 589), for the

very ereditable character of their contributions.

HAODEN, A., and SONN, Aberdeen, Mannfacturers (134, p. 585), for specimens of dyed wools in every shade of

HUBBON, JANES, Leicester, Mannfacturer (199, p. 588), for good Vigonia hosiery, black worsted bosiery, and an imitation of Shetland half-hose.

Inflation Johns and Sox, Nottingham, Inventor and Manuffecture (81, p. 88), for articles of eleching finhiumed to fit the best and waist of the weaver, and registered gusset to band, 700 lace insteps of No. 290 yars. The workman who made the latter article also deserves commendation.

MUSSON, R. and J., Nottingham, Mannfacturers (97, p. 583), for superior plaited gloves, and good plain silk gloves.

POPE and PLANTE, 4, Waterloo Place, Pall Mall, Lon-

don, Manufacturers (6, p. 576), for surgical elastic belt, sock, &c.

SHAW, JOHN, Radford, near Nottingbam (91, p. 582), for bis application of the principle of the Jacquard to the stocking frame.

stocking frame.

WHEZELER, T., and Co., Leicester (206, p. 589), for the application of the stocking frame to weaving shawls.

application of the stocking trains to a strong trains to The Jury also make Honourable Mention of John Richands, Jun., Riste Place, Nottingham, the maker of the silk hose, No. 1000, exhibited by Messrs. J. and R. Morley (105, p. 582), for the great skill displayed therein.

BOOTS AND SHOPS

Roots and aboes have been exhibited manufactured from almost every description of material, and from most parts of Europe and the United States; in some instances great novelty of construction and adaptation bave been manifested, but we bave chiefly to remark upon the greater or less amount of skill attained, in producing an article of fashionable ne.

On review of the whole of the hoots and shees of every class and description exhibited to the Jarons, the conclusion arrived at is, that the improvements which have been made during the last five or six years by the English manufacturers have enabled them to compete with the foreign; the introduction of foreign leather

s since the alteration of the tariff a few years back, as well as frowign boots and shows at a lower rate of duty, has bad the effect of rousing the energies of the English mannfacturers, and of calling forth the requisite takes to re bring about the results before alluded to; and not the least remarkable part of the question is the fact, that the increase in the consumption of English boots and show has not been less (in the period before named) than

30 per cent. From Prance, it must be observed, that in many cases, exhibitors have shown goods remarkable for qualities more esteemed in the country for which they are registed than in our own; and such goods must not be regarded entirely with an English exhibitor.

The Jury award Prize Medals to the following Exhibitors:-

ADDINGTON, W. H., Norfolk, Virginia, United States (471, p. 1465), for very strong shoes for mining purposes, ATLOTT, J. G., 69, New Hond Street, London, Inventor (32, p. 578), for a novel and economic plan of cutting, by which a short boot can be made at nearly the same cost in material as a shoc.

BATHIER, V. (Creuse), France (22, France, p. 1172), for novelty and cheapness in the production of wooden shoes, with leather applied to the top of the soles; and for the taste displayed in the manufacture.

for the taste displayed in the manufacture.

23.7, Austria, p. 1923, for strong and excellent workmanship.

CLARKE, CYRES and JAMES, Street, near Glastonbury, Inventors and Manufacturers (48, Class XVI., p. 520),

Inventors and Manufacturers (48, Class AVI., p. 529), for clongating goloshes, clastic insertions on the instep, both useful and novel, and an excellent assortment of ladies' shoes in various styles.

DESCHAMPS, N., 14, Galérie d'Orleans, Palais National,

Paris (1185, France, p. 1234), for his plan of cutting without block a front in one piece of leather. Derrossica, sen., 13 Rue St. Dominique, Paris (1200, France, p. 1235), for solid and excellent work. The Jury consider that Hononrable Mention ought to be made of the workmen who produced the best,

made of the workmen who produced the best,
Difference and Mixinotrix, 20 Rue de la Paix, Paris
(1201, France, p. 1235), for excellence of workmanship
in boots and show. Honouruble Mention is also due to

the workmen who produced the best articles.

Geleration and Co., 13 Old Bond Street, London (179, Class XVI., p. 525), for riding-boots, of excellent manu-

The strong and Exert, Derby (150, Class XVL, p. 525), Termingtones, or excellent manufacture, produced with great care and attention.

GRONKOFF, GRONGE, Vienna (343, Anstria, p. 1024), for strong and good boots and shoes, of excellent work-manship.

HEFFORD and Exert, Derby (150, Class XVL, p. 525),

for clased Wellington hoots, of excellent worksmanking, etaborately and beamifully "stablect." Honourable II, Mention is also due to the workness who produced them. Httessos and Soxs, 30 West Smithfield, London, Mynourabeture (192, Class XVI., p. 526), for general excellence of the lighter kind of export and other great conditions, Jonns, 66 Bond Street, London, Manufacturer (114, Class XVI., p. 523), for the apperior workmanking, he

great excellence, and boauty of ladies' shoes.

JETTERS, W. H., 467 Broadway, New York (116, United States, p. 1441), for a case of ledies' boots and shoes, of excusiste workmanship; the Prize Medal to be awarded to the workman, and Honourable Mention to the mann-

KUNUSTH, ANYON, Vienna (333, Austria, p. 1023), for magnificent slippers in the Turkish style, of excellent

work and elegant appearance.

LEXEMENT, J. P., 14 Rue dn Paradis Poissonnière,
Paris (578, France, p. 1205), for a remarkable intrention
for making boots and shoce by means of brass screws, the
work belong present diopether by an extraordinary pressure,
thereby preventing damp from entering. There are,
also (by the same exhibitor), other mechanical com-

and the property of the same extension, other incentions are as a short, combining great novelty and utility.

Massez, — 24 Re. Auhyle Boneber, Paris (1347, France, p. 1240), for excellence of production relative to price, the articles being at once cheng and well made.

METER, F., 17 Rue Froncliet, Paris (1352, France, p. 1240), for the great execlience of the workmanship of ladies' shoes, and beauty of fluish. The Jury also desire to make Honourable Mention of the workman or workmen who executed them.

worknen who executed them.

Monra, W., Berlin (186a, Prussia (1, Zoliv.), p. 1058), for elops of light and elegant quality, and for kind boots, for elops of light and elegant quality, and for kind boots, Class XVI., p. 243, for greened excellence.

Parker, J., 35 Dame Street, Dublin, Manafacturer (249, Class XVI., p. 227), for excellence of work in strong boots, and the great erac evineed in the light boots. It is desired to make Honormble Neutrino of the

workmen who produced the stout work PEPLOW, W., Browning Street, Stafford (157, Class XVI., p. 525), for workmasship of a high character, and

the application of an elastic spring. Pointen, P., Châteaubriand (Loire luferieure), France (1398, France, p. 1243), for the excellent quality and make of self-coloured leather boots, for very hard wear. These articles are highly esteemed in France, and fulfil the peculiar requirements of the market for which they

POPINOTE, SOPHEA, of Tiffis (310, Russia, p. 1376), for shoes, slippers, and other articles of usual and useful wear. The Jury also desire to make Honourable Mention of three workmen.

SHEKONIN, ALEXIS, Government of Novgorod, town of Novotorjok (275, Russis, p. 1375), for embroidered boots and shoes, and other goods, of the highest class of work-

mauship in boots. THERRY, C. A., 301, Rue Gré, Paris (391, France, pp. 1196-97), for gentlemen's boots of great excellence. The Jury desire to make Honourable Mention of the best

workmen by whose skill these were produced. THOMAS and Son, 36, St. James's Street, London, Maaufacturers (211, Class XVI., p. 527), for high-class

workmanship in boots.

Walsir, William, 7 Bockingham Place, Fitzroy Square,
London, Maanfacturer (207, Class XV., p. 526), for welted cork soles of high merit as to workmanship. WENNER, J. (3, Luxemburg, p. 1130), for the excellent quality of shoes for labouring men, and for cheapness, and a novel principle in the uniling.

The Jury make Hononrable Mention of the following

ADOLPHI, C. F. W., Berlin (172, Prussia (I. Zollv.), p. 1057), for a case of well-made ladies' boots and shoe ALLEN and Son, Pembroke, Wales, Manufacturer (149, Class XVI., p. 524), for a stout-made boot. Ileann and Jerrs, Parade, Northampton, Manufacturer (11s, Class XVI., p. 524), for "stabbery" of the very-highest class. The workman who executed it is deser-

iug of Honourable Mention.

BECKETT, GEORGE, 41 Fenehureh Street, Manufacturer (220, Class XVI., p. 527), for well-made hoots and shoes. BRIDARD, J., 53 Rue Vivienne, Paris (1115, France, p. 1232), for strong boots and shoes,

BAKDIFF BROTHERS, 5 Rue Colbert, Tours, Manufacturer (73, France, p. 1175), for strong and very good shoes. Barrn, N. A., and Co., Lynn, Massachusetts (411,

United States, p. 1462), for very good shoes for children. Cam-Fryaira, Mannfacturer (263, Belgium, p. 1159), for boots for exportation, and their excellence relative to

CLARK, B., Whitehaven, Cumberland, Manufacturer (154, Class XVI., p. 525), for a lady's loot "clumped" with wood.

COWLING, , Riehmond, Yorkshire, Manufacturer (142, Class XVI., p. 524), for easy shooting boots of excellent workmans Carar, James, Wisbench, Manufacturer (141, Class

XVI., p. 524), for stout boots. Coulings, (1569, France, p. 1252), for varnished skins and boots made therefrom.

Doe, W., Colchester, Maunfacturer (145, Class XVI

p. 524), for very strong and well-made invigator' boots.

Jacons and Drevas, 32 Rue de la Paix, Paris (886, France, p. 1222), for ladies' boots and shoes suited to the bigher classes of society, very well ande.

LANGDER, J., Vienna (329, Austria, p. 1023), for good examples of boots and shoes, LEBRUE, Petersburg (311, Russia, p. 1376), for clore

and goloshes. LONGBOX, R., and SONS, Derby, and THOMAS SMITH.

Bedford (119, Class XX., p. 584), conjointly, for the in-troduction of the elastic welt into boots and shoes. Millara, jau., Warsaw (234, Russis, p. 1374), for ex-ceedingly light well-made boots, weighing only three **OUDCES**

NORMAN, SAMUEL WILLIS, 4 Onkley Street, Lambeth (167, p. 586), for excellence of work in lady's cork-soled

PEAL, NATHANTIL, 11 Duke Street, Grosvenor Square (197, Class XVI., p. 526), for two pairs of very good fishing or hunting boots of excellent workmanship. RAPP, C. F., and Son, 22 Rue Feydeau (974, France, p. 1226), for tasteful-looking goods.

ROBERT, A., 123 Regent Street, London (224, Class XVI., p. 527), for excellence of workmanship.

A. L., p. 537', for excellence of workmanship, Schuwaczusz, jun., Mayone (47, Grand Duchy of Hesse, p. 1128', for well-made gentlemen's boots and shoes, "spring-fastened." Scott, S. T., Union Street, Sonthwark (228, Class XVI., p. 527), for a "hast" with an adjustment to clongate the model of the foot; a very useful and ingenious improvement,

Susga, II., Nautes, and La Morinière (Loire-Inférieure) Notation of the Community of the Communi

duced by the peasants of the country VANDERGOST, M., Brussels, Belgium (427, p. 1164), for

boots of excellent quality.

Viault-Esté, J. J. J. B., 17 Rue de la Paix, Paris (725, France, p. 1214), for a very handsome case of ladies' shoes.

WILSHIN, S. B., 86 Albany Road, Camberwell (205, Class XVI., p. 526), for a method of fastening skates to

GLOTTEL

The article of gloves, on the manufacture of which so much skill and talent have been of late years brought to bear, employs a large amount of the population of the United Kingdom. We have to report many very valuable and highly important contributions, prepared with great skill, and exhibiting this branch of industry in every form in which it can be presented. France, particularly Paris, many cities included in the Zollvereiu, and some in Denmark and Switzerland, have also contributed specimens of gloves. It will be needful to remark, in the first instance, upon the great talent of the Freuch dyers of hid skins: in one case as many as 94 different colours are exhibited in the article of ladies' kid gloves; and varioua other descriptions are shown, particularly in lamb and sheepskin gloves, wherein great skill is exhibited; but it appeared to the Jury, that French gloves being so very largely imported into this country, some of the more im-portant foreign manufacturers possibly considered that their articles were sufficiently well known, and did not think it worth while to send any contributions to the Exhibition. The Associated GLOVERS at Prague have forwarded a highly-interesting contribution, which illustrates the state of this branch of industry in their city, in a mauner highly ereditable to their skill. In conclusion, we may observe, that since the alteration of the tariff, and the importation of French kid skins, a rapid advance has been made by the English manufacturers, their skill and energies having been greatly called forth thereby,

The places at which gloves are chiefly unde, are, Lon-don, Yeovil, Worcester, Woodstock, Torrington, Hexham, and Witney; and the value of the yearly produce is estimated at about a million sterling. Total of hands employed in England is about 46,000,

The Jury award Prize Medals to the following Exhi-

Ball, W. Y. and Co., 32 Wood Street, Chenpoide (80, p. 581), for a variety of kid gloves, remarkably well

Chosson and Co., 63 Rue Montmartre, Paris (1150, France, p. 1233), for ladies' and geutlemen's kid gloves. ALLCHOFT, and Co., Worcester (78, p. 581), for very handsome and interesting collection of gloves showing the various kinds produced in England; with very few exceptions, of the highest class of workmanship.

Exson, T., Milborne Port (185, p. 587), for two-finger gauntlets, and various gloves, exhibiting very good

FOSTER, PORTER, and Co., 47 Wood Street, Cheanside (2. p. 575-6), for plush plumage gloves of good quality, forming a variety of acvel and fashionable articles. FOWNER BROTHERS, 41 Cheapside, London (82, p. 552), for Irish kid, English dressed men's round seam gloves, of good quality

HOUSIGANT-CHARDIN, Rue da Faubourg St. House (1627, France, p. 1256), for an assortment of gloves of excellent quality and colour, and very well sewed. Joeven and Dovon, 8 Boulevard Bonne-Nouvelle (1279. France, p. 1238), for a great variety of kid gloves of minety-four different colours, JOUVIN (Widow , Xavier (893, France, p. 1222), for

many specimens of gloves of very good quality, LAYDET and Co., 27 Rue de Greuelle St. Honoré (226, Frauce, p. 1191), for a case of gloves very well sewed. France, p. 1121; no a cased or govers very well seven.

LECOG-PREVILLE, 50, 52, 53, Passage du Sammon,

Paris (1393, France, p. 1239); for an assortment of lambit
kid gloves of good quality and taste.

Prauer, Glovers' Association of (336, Austria, p. 1023),

for a very handsome contribution of gloves of various de-

Whitne, E., jun., Yeovil (186, Class XX., p. 587), for habit lamb-skin gloves, of a superior quality and very well made, the trade being prettily illustrated in the manipulation.

HATS.

In this branch of industry, examined by the Jury and Associates, important from the large anmber of persons employed in its various ramifications (scarcely less than 60,000), there have been aumerous contributors; Loadon, Manebester and other parts of Lancashire, Cheshire, Germany, France, particularly Paris, the Netherlands, and the Zollverein, have, at considerable cost, forwarded illustrations of their aunufacture. The specimens may be divided into four different classes-1st, The old make of beaver hats, with nap; 2ud. The silk plush hat on foun-dations of cotton, linen, and other fabries; 3rd. The felt but (some specimens were shown in pure beaver fur), chiefly of hare's for, or rabbit's for; 4th, Hare's for or rabbit's fur, mixed with lamb's wool, for lower or cheaper qualities. In all these descriptions of goods, the manufacture of each country is necessarily in conformity with the taste, style, and habits of the people; whence the various productions in this Class are highly suggestive sible to give a summary which will do justice to the

and lateresting. In the British contributions there are several very novel styles introduced, wherein the manufacturers have given considerable latitude to their faucy; but in an article of fashion, and of such constant use as hats, it does not appear to be easy to change the habits and tastes of the wearers, or to induce them to adopt a new costume. The specimens, where attention has been chiefly directed to excellence in quality and vory high finish, are commendable, and form an interesting feature in this section of the Exhibition.

The manufacture of lists ranks as one of the oldest of the staple manufactures for which England is eclebrated, and at an early period hats were articles of considerable export. They have been the subject of many legislative engerments; and it was not until the close of the last eentury that they were freed from Government interference, by the abolition of the stamp duty, which up to that time was chargeable upon them,

CHRISTY and Co. (35, p. 578-9), of 35 Gracecharch Street, Londou, and of Stockport, near Manchester, have ecutributed a most complete and interesting illustration of the manufacture of hats, both in beaver and silk, con-sisting of materials in the raw state, prepared for use, and in the different stages of numufacture up to the finished state, as made for the home, colonial, and foreign markets, together with the tools used in the manu-Although this exposition completely fulfils the object

proposed in the Exhibition, and the manufactured specimens are of the highest class, the Jury are unable to award the prize to this house, from the circumstance of its being one from which a Juror has been selected,

The Jury award Prizes to the following Exhibitors:-BERNE and MEZZARD, 56 and 57 Great Guildford Street, Southwark (103, p. 583), for a case of hats of various styles, well manufactured. CHENARD BROTHERS, Paris (87, France, p. 1175), for a

beaver last, and two hare's for lasts, made upon the old Flemish principle, and very well done.

COUPIN, J., Aix, Rhone, Rue de l'Aigle d'Or (1162, France, p. 1233), for some felted hats "in the rough, very well felted, and good in quality.

Sawsowns and Woodsow, Oldham (105, p. 583), for a selection of felt bennets of good quality, and handsomely got up, in pure beaver and other furs,

The Jury have made Honourable Meation of the following Exhibitors :-Baron, W. and Sons, Rue St. Avoie, Paris (1069, France, p. 1129), for hats made of bare's fur, on the Flexish principle, and exemplifications of the various

stages of manufacture. BRAUND, J., 26 Mount Street, Grosvenor Square (66, p. 581), for a cap with transparent tale peak, useful for travellers.

Lyons, J., 12 and 13 Artillery Place, Woolwich (67, p. 581), for military caps, which will resume their shape after having been folded in a knapsack. MELTON, IL. 194 Regent Street, Manufacturer (54, 580), for a lady's elegant laveuder-coloured riding

P. S Pearson, J., Stockport (126a, p. 584), for a child's boanet and feathers,

ARTICLES FOR GENERAL OR PERSONAL USE. The almost infinite variety of articles in this class, although possessing great merit and excellence, do not, except where specially noticed and recommended by the Jury, exceed what may be obtained in the ordinary way of trade, and although many of these contributions are valuable, and exhibit great skill and talent, serving to complete this department of the Exhibition, it has not been deemed accessary to do more than meation them in general terms,

Upper Clothing.

Considering the vast extent and variety of this brane of industry in every part of Europe, it is almost impor-

talent and ingenuity displayed by many individual con-tributors. In the fishiounble articles of dress presented, not only from the metropolis, but from many of the largest towns of the United Kingdom, great skill is exhi-bited; and when to these are added the leather coats richly embroidered and lined with skins and fars from the northern parts of Europe, the richly controllered dresses of Hungary, Russin, Tartary, Turkey, Egypt, Chioa, and India, of exquisite workmanship, and in mar cases made up with the greatest ingenuity to repel th cold, it is imperative on the Jary to call attention to the high merit due to the contributors of this vast assemblage of merchandize, and to bear testimony to their great and persevering industry. The cursory observer passing from section to section, may indeed admire the various pro-ductions of art; but those about whose duty it has been to visit every individual contribution, and examine it in detail, can justly appreciate the vastoess of the effort by

which it has been made. The importations of wool for home consumption in the manufacture of cloth, exclusive of that of our home growth, was, in the year 1849, 279,472 bales, or about 56 millions of pounds. It is not possible to estimate the number of yards of clith into which the said wool is wrought, or the various articles made therefrom; but it is evident that the working up of cloth ioto clothing "for immediate personal or dimestic use," must necessarily employ a large mass of the population. In Loudon sarriy emptoy a rarge mass or the population and alone, it is estimated that there are 30,000 persons employed in making up clothes for men. It must be ployed in making up clothes for menremarked and regretted, that the Exhibition has received un contributions adequately representing either the British or foreign superior "miloring department," or the article produced by the ready-made and slop-selling departments, employing so many thousands of hands, in which also a large capital is embarked, and from which sources, whether it regards Great Britain or foreign countries, the army, may, and other Government iostitutions, public bodies, the commercial marine, and, to a great extent, the colonies, derive their sopply of clothing.

The Jury award the Prize Medal to the following Exhibitors:

BUCKMANTER, W., and Co., 3 New Borlington Street (14, p. 575), for a very bandsome blue frock cont, and varitus articles of Court costume; exhibiting great taste and improvement in this kind of dress.

KRACH, Iluothers, Prague (391, Austria, p. 1029), for double pilot-cloth, to form a cont either side ontwards of a different colour, and coats of excellent workmanship. MALATINZEY, E., Hungary (594, Austria, p. 1029), for richly-embroidered over-esu

McGer, Jso. G., and Co., Belfast, Manufacturers (118, p. 584), for several extremely elegant waistcoast piece the patterns for which were produced in the School of Design, Belfast OPIGEZ and CHAZVELE (336, France, p. 1193), for very

excellent embroidered silk, wrought up into dresses of elegant style. Singer, J., Posth, Hungary (392, Austria, p. 1829), for several very good dress conts.

Welch, Mangerson, and Co., 17 Chearside (212, p. 583), for a very elegant contribution of braces, carriage rugs, ties, cravats, handkerchiefs, shirts, robes, &c.

The Jury make Honoarable Mention of the following Exhibitors :-BALLY and Co., Schoenenwerd (210, Switzerland,

p. 1280), for a display of braces, of merit and moderate BRIGGER and PERSIER, 22 Rue Jeau Robert, Phris (1116, France, p. 1232), for a case of elegantly-wrought

FARRANCE, Miss, Bray, County Wicklow (176, p. 587), for some very beautifully-knitted stockings.

HARDING, T., 108 Regent Street (211, p. 589), for real agate battons, good both in style and taste. HARBIS and TOMRINS, Abingdon, Berks (111, pp. 583-4), for two smock frocks, exceedingly well made by two made.

cottagers.

Holmes, J., and Co., 171, Repent Street (84, p. 582), for n very elegant showl clock, of new design. Herr, Widow, Rosen (270, France, p. 1189), for a great variety of clastic very well made.

Kraner, T., Lanerick (175, p. 587), for a novel plan
of inserting India-robber in articles of dress.

RADOURDEN, 88 Rue dn Marsis, St. Martin, Paris (1416, Fraoce, p. 1244), for elegantly-made braces, at very moderate prices

SAYCK, J., and Co., 57, Cornhill (307, Classes XII. and XV., p. 501), for a very light evat called "Piuna Coat."

Solonov, Mrs. S., 52 York Road, Lambeth (86, p. 582). for an embroidered ball dress,

STEWART, JANE, Templetrine Globe, Bunder, Ireland (1774, p. 587), for some very elegant knitting. VINCENT, RICHARD, Glastonbury (177, p. 587), for R suit of clothes made of black dyed and prepared sheep skins; a new application of this unserial.

WALKER and Bans, 306 Strand (63, p. 581), for an alpaca cout sufficiently light and portable to be carried in the pocket.

Shirts

On carefully examining the shirts, our opinion is, that in the finer quality, into which embroidery enters largely, the French are superior; there is but a small exhibition from wholesale houses, and scarcely any of a low quality; the collection, therefore, embraces only the higher class of goods. This branch of our industry is an article of fashion, and the number of persons employed in much ou the increase. In the better classes of work, the hands obtain for their labour prices which afford them a fair livelihood, their earnings amounting from 9s. to 12s. per week: the shirts for which wages of 2s. each shirt are paid, enable the quick workwoman to earn about 2s. per day; but it must be observed, that by the division of labour, an increased amount of wages is carned relatively, and the work is thereby considerably enhanced in quality and skill. Thuse observations apply solely to the higher class of shirt-making.

The Jury award Prize Medals to the following Exhi-

Docca-r and Ducarac, A., 21 Rue de la Paix, Paris (147, France, p. 1178), for shirts, embroidered with crests and mones, of good shape and make; and for various other articles HAIGHT, Mrs. W., New York (365, United States

p. 1461), for a plain shirt, of good shape, and very good wark; a light material, suited to bot climates. Moneau and Co., 22 Rue d'Engheio, Paris (652, France. p. 1209), for some exquisitely-embroidered shirts of good shape, suitable for French wear.

The Jury make Honourable Meatlen of the following Exhibitors in this division :

Burn and Co., 189 Regent Street, London (24, p. 578) for attached shirt collar to a waistcost; the waistcost of excellent shape. (Prize Medal nwarded in Class XIX.) DARNET, Rue Richelieu, Paris (1578, France, p. 1252 for very elegantly-embroidered shirts. (Prize Medal

HAYEM, -, sen., 38 Rue du Sentier, Paris (1265, France,

HAITM, —, sen., so not on center, I BIN (1400, FIRECO, p. 1237), for exceedingly benedifial remains.

Scott, P., Edinburgh (141, Class XX., p. 585), for fine-t-resided shirts, nod several collar-shirts.

SNITH, J. F., S Lawreec Lane, London (29, p. 578), the control of the co for a shirt without seams or gathers; and Moravian needlework.

SOCIETY OF NEXDLEWOMEN (147, p. 586), for a enlice-ion of shirts of good shape, and very firmly worked, Exhibited by a benevolent lady.

VALTAT and ROUILLE, 70 Rue de Ramboteau, Paris (709, France, p. 1213), for a quantity of good shirts, well made, and very cheap

WHEELER and AMEET, 23a Regent Street (22, p. 578). for a shirt, claborately embreidered, and very well

Cornets.

On reviewing the articles of corsets, as produced by the Exhibitors, the Jurors and Assistant Jurors converse with the trade, after carefully examining every case, find but few specimens in which there is novelty combined with useful improvement: there are several combinations of anatomical bandages, or supports, with the corset, as an article of dress; with these exceptions, it does not appear that any very great advance has been made in the higher class of corsets beyond the attention which is unconsingly given to an article of such universal and fashiotable use. In the instances before alluded to, the improvements have been pointed out. In the general trade, within the last four or five years, the make and shape of these articles have been greatly improved, so that there can now be obtained by all classes, a well-formed and good corset at a very moderate price; a large quantity are now woven by machinery.

The Jury award the Prize Medals to the following Jose, Madames, Spitens, 45 Rue Neuve St. Augustin, Paris (892, France, p. 1222), for a cornet of very novel

JOSSELIN, J. J. (551, France, p. 1204), for corsets.

ROBERT WEELEY, and Co., Bar le Duc, Meuse (1444,

France, p. 1245), for corsets of excellent manufacture and nnexceptionable shape. VAN BENEREN-BRUERS, Brussels (345, Belgium, p.

1162), for stays of good description, without seams and of excellent workmanthip. The Jury make Honoarable Mention of the following

Exhibitors in this Department :-

Benorn, Mndame, Brussels (349, Belgium, p. 1162), for a variety of excellent stays. PIPER, T. F., 4 Bishopsgate Street Without (41, p. 579), for the hygienic child's corset; of novelty and great

advantage.
Shith, Mrs. Charlotte, Belford (119, p. 584), for a corset of construction,

South's, Hypotite, Madame, Paris (1492, France, p. 1248), for corsets of good make,

Steam Plait and Bonnets. Though the manufacture of straw-plait and bonnets in England may be considered of recent date, its origin being about one hundred years ago, it has now nrrived at a state of great perfection in all its varied branches: this may in a measure be acconoted for by the circumstance of the whole female population wearing bonnets; which, with the exception of North America, are but partially used in other countries. At the present moment, it is calculated that from 60,000 to 70,000 persons are engaged in the production of this article; and it is considered that the yearly return canoot be less than from \$60,000L to 900,000L. With regard to straw goods of foreign manufacture, we have to mention, as most prominent, those of Tascany and Switzerland. The Leghorn hats, formerly in so much demand, are now but very partially worn, and the same remark may also be applied to the Triscan plait, which, at the present time, is not indepted in fishionable wear. The Swiss fancy straw-plaits and triomings occupy a prominent place in this branch of industry, are of great importance to the localities where they are produced, and great taste is displayed in their design and execution, so as fully to meet the constant demands of fashion. Germany and Lombardy have also a limited share in the straw manofacture, of whose pro-doction a few specimens are exhibited. We regret to be onble, from want of sufficient data, to state the extent of the amount of the annual returns, or of the employment furnished by the foreign branches of this trade. The Jury award Prize Medals to the following Exhi-

bitors in this department :-Apr BROTHERS, and other exhibitors (227, Switzerland, p. 1281), for straw plait,

ALLEN, JAMES, and Co., 158 Cheapside (13, p. 577), for ladies' and children's straw hats and bonnets, principally of British materials, some of which are very good.

GREGORY, CURITY, and Co., 15, Aldermanhury (8, pp. 576-7), for an assortment of hats and bonnets, with specimens of various kinds of straw and plaits, forming an interesting exhibition of this hmuch of jodustry, Loxo, George, of Loudwater, Bucks (16, p. 578), for

hats and bonnets made on the pillow-lace principle. MCHS, CONNELL, and BRODIE, Luton, Bedfordshire (173, p. 587, and 215, p. 589), for bonnets made from rye-straw, grown in the Orkney Islands, in imitation of

the Tuscan plait. NANNUCCI, Florence (81, Tuscany, p. 1297), for a case of very fine Leghorn hats and capotes of good workman-

SCIZEBERGER and AKERMANN, Meisterschwanden, Switzerland (234, p. 1281), for n variety of Swiss straw plaits and trimmings of good kind, exhibited in six glass

Vysz and Soxs, 76 Wood Street (11, p. 577), for a case of bonnets of various sorts, in good taste and well mann-

Vysz and Soxs, Prato, Florenec (79, Tuscany, p. 1297), for a selection of very fine Leghorn hats and capotes

WELCH and Sons, 44 Gutter Lane, London (12, p. 577), for a case of hats and bonnets, made of foreign and English materials, of good style and manufacture Womler and Co., Canton of Argovie (227, Switzer-

land, p. 1281), for a large assortment of Swiss straw-plait and trimmings, of all descriptions; together with articles showing great skill in this branch of industry. The Jory make Hononrable Mention of the following

Exhibitors in this department CLARAZ, A., Fribourg, Switzerland (228, p. 1281), for a variety of straw-plaits, hats, and bonnets, illustrating

the peculiar description of industry of this canton. (Prize Medal awarded in Class XXVIII.) DEFIERRE BROTHERS, Heiden, Canton of Appenzell (189, Switzerland, p. 1278), for embroidered straw bonnets, got up with great taste.

MILWARD, JANES, and SONS, New York (93, United States, p. 1439), for bonnets made of cotton-braid; commendable for being a new application of this material. Various articles of foreign manufacture, not easily classed with the European goods, have been considered by the Jury in reference to the producing countries,

Tunn

Magnificent dresses for Turkish ladles (page 1414), of rich silks finely embroidered in gold and silver; dresses for gentlemen, and also richly-embroidered woollen dresses woren in one piece. The strength of thread fabrics, and the excellence of the wearing, entitle them to notice as highly-interesting specimens of woollen manufacture.

The Jury make Honourable Mention of the following articles exhibited in this department :-

(41, Tunis, p. 1414), silk wrought as a separate article, of great substance and beauty, highly remarkable; and the woollen bernous for common wear, and that for the higher classes, are both very excellent.

(48, Tunis, p. 1414), for dresses of the country, in eotton and silk; also dresses in woollen and mixed materials, exhibiting great strength and excellency in tho weaving.
(10, Tunis, p. 1413), for various articles of dress, for caps, and many shawls made of worsted, and other materints, very strong and durable, and colours remarkably

(12, Tunis, p. 1413), for a variety of slippers adapted for use in that country, and some richly-embroidered

TURKEY.

The admirable examples of costumes, collected by order of the Turkish Government, and exhibited by 11st Highness the Sultan, were found worthy of the highest commendation by the Jury; but anfortunately, from the system adopted in the collection of these examples by traders, from the dwellings of the poor in the more useful domestic articles, and the larens of the wealthy in those 212

of fancy embroidery, such as slippers, veils, &c., it is impossible to recognise, either by Medal or Honourable Mention, many of those to whom such distinctions are justly due, as no names are given whereby the Jury can take cognizance of the articles. Those cases which the Jury have been enabled to recognise are selected as much from the facility for giving such recognition as for the high merit displayed in the production, is assuuch as there are others deserving of the same consideration, could the Jury have discriminated amid the vast collection of

The embroidery and fashion of the costumes are of the highest class, and extremely eastly. These dresses, although the costume of the country, are very suggestive; the style of the embroidery is of the highest order-an art which appears peculiar to the country: the slippers also are very elaborately wrought; the veils are richly ornamented with gold and pearls, several of them valued at 25/, each,

The various articles of ladies' attire in silk are ver richly embroidered; erasse dresses, embroidered scaris of the most exquisite description, not only as regards the material, but also the design and the combination of colours with the arrangements and disposition of the various materials employed; rendering many of these

specimens of the utmost value to our manufacturers Mnny articles of dress from Damascus are not only for the higher, but for the industrious classes; and when it is remembered that many of these are the domestic production of the people, and made in their own cottages, too much praise cannot be bestowed on the skill, elegance, great usefulness, and darability of the goods exhibited

The hosiery is of various kinds, the honsehold produce of the Angora women. Some of the socks are as high as 10s, per pair, while the commoner ones, for the workingpeople, are produced at exceedingly low prices.

Prize Medals have been awarded to-

His Highness the SULTAN OF TURKEY, for the collection (p. 1436). FERUVELANCE, The (Tailors' Association) of Janina (408 to 413 in the Turkish Catalogue, p. 1390), for Alba-nian costnmes, male and female, of rich effect and excel-

leut workmauship.
Sorialioglou's Daughter, Constantinople (874, 875, 876, in the Turkish Catalogue, p. 1393), for veils, em-broidered in gold and pearls, with silver fringes.

London, July 1851.

The Jury make Honourable Mention of the following persons, whose works are exhibited in the Turkish Department: BUKUPGY (THE GIRL), Constantinople (988, 989,

piskidoly (1 im Gint.), Constantinope (998, 991, 17th/sis Catalogue, p. 1394), for enbroadered slippers, called ship-ship and filar, Cananaris Wirr, Constantinople (991, 995, Turkish Catalogue, p. 1394), for embroidered slippers, escreux (7 im Gint.), Constantinople (98, Turkish Catalogue, p. 1394), for embroidered slippers, called Signer, p. 1394), for embroidered slippers, called Trazaris Wirry, Constantinople (986, 994, 996, Turkish 996, Signer). Catalogue, p. 994), for embroidered slippers, called ship-

GREECE.

Greek dresses are exhibited in blue and silver; also red and gold dresses from different islands, of very good work, and elegant patterns,

The Jury desire to recognise the articles exhibited in this division. These consist of cloth of real cashmere to a division. I nese consist of coun of roal casinore wool, extremely light, thin, and fine; various dresses oxhibiting the Indian costume, in gold tissue and embroidered. There are also articles of dress from Cashbroidered. There are also articles of dress from Cash-mere, richly embroidered in needlework; and mustin, the produce of the country. The silks are stated to wash perfectly well. Acknowledgment is due to the Hosoura-ABLE EAST INDIA COMPANY (p. 857), for this contribution,

The Jury desire to make Honourable Mention of-Anams, W. H. F., Muntreal (331, Canada, p. 968), for cloth made in Canada; his own production. Barbeau, J., Quebec (Canada, 110, p. 965), for boots

made of deer skins, very excellent in quality, cheap, and CHINA.

waterproof.

Hanourable Mention is due to the Exhibitor of the magnificent dresses for the higher classes of Chinese, in silk, very richly embroidered (28, p. 1424).

The Jury desire to record their opinion, that if Council Medals are awarded in similar cases, then they are emipently due to His Highness the Sultan of Turker (p. 1385), and His Hinness The Bet of Tunis (p. 1412), for the valuable contributions which they have made to the Exhibition.

T. CHRISTY, REPORTER.

CLASS XXL

REPORT ON CUTLERY AND EDGE-TOOLS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

Jury.

Right Hon. Lord Wilsinglift, Chairman and Reporter, 28 Lower Brook Street. Joseph B. Denham, Depaty Chairman, 456 Oxford Street; Cutler. C. Karmascu, *Zoliverein; Director of the Polytechnic Institution.

NUBAR BEY, Egypt.

Alderman Charles Peace, Sheffield: Inte Cutlery and Edge Tool Manufacturer.

J. Le Plat, France; Engineer-in-Chief of Mining School, and Professor of Metallurgy, Paris.

Associates, THOMAS DE LARCE, 110 Bunhill Row; Ornamental Stationery Manufacturer. (Juror in Class XVII).
THOMAS HETHINSOYON HENRY, F.R.S., 18 Lincoln's fam; Amblytical Chemist.

C. VENABLES, Plomer Hill House, High Wycombe; Paper Manufacturer. (Juror in Class XVII).

* Dr. Schafhautl; Professor of Metallurgy. (Proxy for M. Karmarsch).

characteristics of the Class submitted to their judgment, and to offer such general comment and analysis as may serve in some degree to present a connected view of the information therein conveyed, with respect to the progress and position of this species of industry among the

countries whose contributions compose it. There is one point upon which an explanation should There is one point apon which an expansion strong be given at the outset. Two important sections of those articles which would ordinarily be comprehended under the designation of "Cutlery," are not here included—those of surgical instruments and of weopons of war. The objects therefore referred to this Jury consist of such as are designed either for common and domestic use, or for

various manufacturing operations. It appears, according to the information laid before the It appears that there are altogether about 368 RARDONOUS this Class, distributed, very unequally, among tweety-two of the geographical divisions contained in the Offici Catalogue. The United Kingdom, as was to be expected, assuming to not less than 45 that there are altogether about 368 Exhibitors in has farnished a proportion amounting to not less than 45 per cent, of the whole list; and amoug these are to be found many contributors, on so extensive and varied a scale, that its share in the total display of these articles is much larger than the above numbers would imply. The second place is occupied by Austria, whose Exhi-bitors constitute 27 per cent, of the entire sum. After her the Zollverein States of Germany, furnishing about 8 per cent.-France about 3 per cent,-Sweden and Norway in nearly the same proportion. A very small number of Exhibitors from the remaining countries complete the list, though some of these national collections nowever confined to few individuals, contain objects well worthy of attention

These results must not be taken as any certain indication of the comparative proficiency of the respective countries in the production of commodities of this kind, or of the value of their contributions. It is probable that In some degree they may show the character and nature of the manufacture as carried on in these different states. and correspond with its subdivision among more or less numerous hands in comparison with its total extent. In Anstria, for instance, we find by the Catalogue that the collections specified as assignable to each Exhibitor consist for the most part of one kind of mannfactured article, scarcely any of more than two or three; and we may therefore perhaps venture to infer that the high number of these, as compared with some departments where they

THE Jury for Class XXI, think it desirable to preface are individually more comprehensive, arises from a very their Report by some remarks on the extent and general different distribution of capital among their separate establishments in this branch of industry.

But this is not to be considered as a disparagement to their contributions. Such a condition of the manufacture may be best adapted to the supply of the particular demand for which it exists; and, as regards the present occasion, even apart from such considerations, the appearance of a numerous list of exhibitors from any one asset of a numerous net or exhibitors from any one country may be reasonably taken as a gratifying evidence of the interest and activity awakened there by the invi-tation to co-operate in a display of the works of universal

industry, and of an active desire to share in its bonours, The characteristics of the different national collections are, however, interesting in more than one point of view. We may detect in various instances indications of the peculiar condition and habits of the people whence they come, of their social and industrial wants and nime, as

well as of their natural or acquired advantages. In England the close proximity of coal and iron, together with abundant facilities for converting the latter into steel, gave, at an early epoch, to this branch of its muo suese, gave, as un earry epoen, to this ornaces of its manafactures remarkable energy and importance. Its steel wares had a wide-spread reputation even in the middle ages. The authority of Chausers assures as that in the floarteeath contrary the "Stelffield whittle" was an article of choice estimation; and, within their respective spheres, the blades of Toledo and Damascus were scared more valued than the more homely entirey of England. This pre-eminence the Jury can have no hesitation in pronouncing that she still retains to a very remarkable degree in the present Exhibition; though the general statement must now admit of modification, and it would be untrue and unfair to make it without adding, that she has in certain branches of the manufacture some for-midable rivals. Still, the long-established trade of this country in steel goods of every description, and her ancient practice of forging them for the supply of all markets, are shown in the great variety as well as excellence of her contributions, which comprise specimens of almost every conceivable article of this description. But in other countries, where the manufacture has been of m other countries, where the manufacture has been of more recent growth, it is evident that the energies of their artizans have been directed, by a natural consequence, to the production of those particular article more especially called for by their individual position or exigencies. One of the chief objects of the German Custump of the Custump of the Custom toms Union, for instance, has been to encourage the supply from their own workshops of those commodities

of general and ordinary use, which were formerly in great part derived from importation. From the Zollverein States, accordingly, we find a mixed collection of that character, consisting mainly of common cuttery and simple tools, together with some few objects of the plainer kind for certain foreign markets. From Austria, where the mines and manufactures are in the immediate neighbourhood of a large agricultural and pustoral population, it is to be observed that the collection con largely of scythes, sickles, and the simpler implements of In Switzerland the traditional manufacture husbandry. of fine watch-work renders delicate files a matter of primary necessity, and there is therefore a predominance of these among the better articles in this department, The Belgian collection is distinguished by "spiral entwoollen fabrics for which that country has long been famous. In France we of course find a very miscellaneous collection; but it displays in a marked manner productions indicating, on the one hand, the highest scale of social eivilization and of manufacturing skill in certain spheres and localities, and, on the other, the simplest wants of a primitive provincial population; while in the United States and Catalan, where the occupation of the population is an incessant war upon the forest, the manufacture of axes and woodmen's implements assumes an importance which has raised them to the bighest perfection, and renders this class the most perfect part of the transatlantic exhibition. But it appears advisable to add some more precise notices of the peculiar contents of each national collection; and for this purpose it will be most convenient to take the two great divisions in the order

adopted in the Official Catalogue, First, then, with respect to the United Kingdom, we find that articles in the Class of Cutlery and Edge-tools have been sent from a great variety of places. In England, from London, Sheffield, Birmingham, Warrington, Sourbridge, and a few other towns of less note; from Glasgow and Eliaburgh, hat chiefly from the former, in Scotland; and from Cork, Clonnel, and Limerick, in Ireland. Among these seats of the manufacture there is none, as might naturally be expected, which for extent, variety, and excellence of collection, can compare with Sheffield,
—its most ancient home. We here find every article,
from the most exquisite razor down to the plainest pocketknife, and from the finest saw or file to the most ordinary chisel, displayed, with various degrees of merit it is true, but with a large proportion of the highest. From this collection, the Jury have thought themselves justified in awarding for one remarkable object a Council Medal Messrs, Spran and Jackson (123, Class XXII., p. 606) have exhibited, among an assortment of edge-tools of great excellence, a cast-steel circular saw, of the large size of 5 feet diameter, and of such signal beauty and perfection that it stands far above comparison with any other in the Building. The mere excellence of its quality and workmanship, however, would not, the Jury are aware, have enabled them to distinguish it by a Council Medal, if they had not been able to satisfy themselves that its merit is the result of a new and peculiar process of manufacture. But they entertain no doubt, from the information they have received, that me chanical ingenuity of a novel and special character has been employed by these manufacturers for the production of such articles, without which they could not be carried to equal perfection; and they therefore consider them justly entitled to the highest mark of distinction.

There are two other contributions to which the Jury would have felt themselves called upon to award a similar honour, if they had been at liberty to regard singular excellence of workmanship and quality as of itself a sufficient title. Messrs, Traron and Sons, of Sheffield (190, p. 614), and Messrs, Strans, of Warrington, (39, p. 392), each display a complete assortment of files of various sizes,—the former, for ordinary manufacturing purposes, the latter, for the finer operations of the watch-

the highest assignable reward in respect of these points of merit. Prize Medals, bowever, have been nwarded to them, in common with a number of associates not nuworthy of their company. It will be found that the list of these contains a series of names of which many are of high note in the estimation of the public, and whose con-tributions—some extensive, nud comprising in a high degree almost every variety of excellence, others limited, hut of marked merit throughout-display the choicest productious in the most finished cutlery, and the finest mechanical tools.

The attention of the Jury was particularly called to one overty exhibited by Mesers, BLAKE and PARKIN, of Sheffield, (193, p. 614-15), consisting of the union of two qualities of cast steel, hard and soft, in the same article : having carefully examined these specimens, which were manufactured with much skill, they have no reason to doubt that the process is peculiar to the Exhibitors; but they cannot satisfy themselves that it involves any clear advantage over the combinations of cast and bar steel, and of cast steel and from the methods of cementing which have been long known and practised.

The contribution from London is of course on a more limited scale than that from Sheffield; but it consists of that superior order of cutlery for which the Metropolis has a long-established reputation, and contains articles of high merit in this Class. Among the Exhibitors from London, Mr. Dunnan, of Oxford Street, (46, p. 593), would have been considered by his colleagues deserving of a Prize Medal, if his consent to act as a Juror had not equalified him from accepting it.

The facer descriptions of curlery are nearly confined, in England, to the Sheffield and London departments; but there are a few articles contributed by individual mannfacturers from other places, whose names will be found in the Award List; and there are some also furnished from Ireland and Scotland, which, though not equal to the best from the chief seats of the manufacture, are still of cousiderable excellence.

Manufacturing tools are supplied largely from Eirmingham, and sparingly from Scotland; scythes and files from Stourbridge and Warrington; which latter place furnishes the beautiful collection of watch-files by Messrs. Stabbs, already mentioned.

On the whole it appears that the British manufacture

of cutlery remains still, as heretofore, mainly scated at Sheffield, though it has been established also to a limited extent in some other quarters. The same gradual change of eirenmentances which has operated to transfer, in a great degree, the silk and some other trades from London to the provinces, has had the effect of withdrawing much of this branch of industry from the espital; though a portion, chiefly directed to the production of the higher order of articles, still retains its footing there, and sustains its reputation. On the other hand, the manufacture of the coarser goods, such as tools and mechanical implements, is now extensively shared by several localities which afford the requisite facilities for its successful prosecution, and where the various other forms of industry which surround it create a continued demand for its

productions. Extending our survey beyond the limits of the United Kingdom, from its provinces to its dependencies, it will be found that these present aspects so very different, that certain distinctions are indispensable, with reference to a proper estimate of their position as exhibitors

It is not to be expected that in infant communities, such as most of the Colonies, properly so called, a manufacture of this kind could have attained any considerable growth or perfection; though the greater progress and development of some few have easiled them to meet cereasyment of some few mare entired them to meet their peculiar local exigencies with considerable aucees, We find in this category a read! contribution from the Cape of Good Hope, by the Missionary Sastion at Ganthedal, consisting of various forms of knives adapted to the uses of that country; and from Nova Scotia mother, of cultery made of Nova Scotia steel, though mannfactured in Sheffield! John are creditable to purposes with the cone for bary dimensions, and the local purposes with the cone for bary dimensions, and the lother for minute delicacy, combined with the attention through mannfeatured in Sheffeld is other executable to strongth and efficiency of material, for surpass any other lother colories. While from Canada (West) there is a objects of the man class. They would have described larger assortment, constitute entirely of axes and tools, the former especially of excellent quality, and proving the skill and power of her artisans to supply those particular articles to which her physical exigencies give

the highest importance.

On the other hand, there are contributions from denendencies which are to be considered in a very different light, not newly-peopled, but ancient communities, vari-ously advanced in civilization, and having their own established and characteristic industrial pursuits, often of the highest order of manual dexterity. In this division there are some from the wast territories of the East India Company, which well deserve notice; and a small contri bution from Jersey, The Indian department contains various Hindeo and Malay tools for the use of carpenters and workers in metals; and among them are found, from Moorshedabad, in Bengal, a set of the implements employed by the native artificers in carving the beautiful ivory articles which have so long been admired in the western world, and which present such rare examples of incennity, taste, and, skill,

Articles of this kind, however, are of so peculiar a noture, and of so limited an application, that they can scarcely be considered as bringing into play any principle of general competition or comparison. It is not so with the foreign neighbours of Great Britain, whose productions come next under notice. They will be found to extend, with various degrees of excellence, through all the class of commodities which proceed from the workshops of the United Kingdom, and to include some, also, of a peculiar and distinctive character,

Looking first to Eorope, its foreign exhibitors may be classed under certain great subdivisions, which are na rally soggested by the position and relations of different members, and may conduce to the clearness and convenience of the survey. Thus the several national departments, contained in the total list, may be advantageously connected as follows:-

1. France, Belgium, and Switzerland;

- 2. Austria, and the Southern States of Germany :
- 3. The Zollverein, and Northern States; 4. Denmark, Sweden, and Norway; 5. Russia;
- 6. Spain and Portugal;
- and finally, 7. Turkey, Egypt, and Tunis;
- 8, China; and 9. The United States of America, will com the distribution over the remainder of the world.

1. From France there is an extensive assortment, ranging from the finest ornamental cutlery down to the rudest and cheapest articles for domestic use, which in general character is very good, and in some instances of superior quality. The greater portion appears to be supplied from Paris; but there are a few exhibitors also from the provinces-from Moulins (an ancient seat of this manufacture), from St. Etienne, and from places in the districts bordering on the Rhine,

In cutlery, the best specimens are those of razors, penknives, seissors, and table-knives, many of which are very highly finished and elaborately ornamented, and display great skill as well as superior quality. Among the tools and implements are to be found a very excellent circular saw, showing high proficiency in this branch of the manufacture; and assortments of files, also of considerable merit as to workmanship, though found, after a careful trial, to be not quite perfect as to the quality of the steel. On the other hand, they mention particularly the samples of "web-saws," which are of the very highest class, and, indeed, superior to anything of the same description contained in the English collect

Beiginm supplies cutlery, together with files, scythes, ledger blades," and "spiral cutters." These last articles are portions of the machinery used in the dressing of cloth, and are of a high degree of merit. The cuttery, principally of the table kind, is well finished, but the metal is somewhat soft, and unequal to the workmanship. The same must be said of the scythes and files. Prom Switzerland, the articles consist mainly of ranors,

and of small files adapted to the use of the watchmaker. The former are of fair quality; the latter of the most delicate workmanship, and well suited to the trade for which they are designed, and which has been long successfully pursued in that country.

The attention of the Jury was called, in the French department, to a collection of articles, as examples of remarkable cheapness, which they would not have deemed worthy of mention on any other grounds. These are a ecrtain description of extremely rude pocket-knife, said to be in very universal use among the pensantry of France, for cutting their provisions, and other purposes. They are formed of a rough blade of soft iron, folding into an equally rough turned cylindrical handle of wood. It is obvious that, with such nuterials, their utility must be very limited; but they are sold for five centimes, or about one halfpenny, each, and are therefore in general use

among the poorer classes.

In France, Belgium, and Switzerland, the manufacture of cutlery and edge-tools has greatly improved, and seems

likely to continue to do so

2. Of the subdivision of States which we have placed next in order, the same improvement may, to a considerable extent, be observed. If we include therein Austria. Wurtemburg, and Saxony, we find that the two latter, at least, exhibit specimens of general knife entlery, and of hunting-knives, which, though they cannot be prosounced equal to the best English, are of very good quality, well finished (especially in the Soxon portion), and mounted wish much costly ornament. From Anstria the display is not of so high a class; the cutlery from that country is of a very ordinary description, chiefly the produce of Styria, and is stated to be exhibited, in a great measure, caying one a stated to be exhibited, in a great measure, as an example of cheapness. After such consideration, however, as the Jary have had the means of giving to this point, they conclude that the price is not below what goods of the same quality might be produced for in other countries. The articles are very deficient in merit of any other kind, many of them not even being of steel.

These remarks apply in a great measure to the tools and implements in this department. There are some from Wursemburg of fair quality; bot the assortments of files and other such objects from Austria are indifferent. and not, apparently, very low in price. There is here, however, one description of article deserving of notice, as a curious example of the modification which all tests of merit must undergo when judged by the peculiar uses for which the production is designed. There are from the southern provinces of Austria assortments of scythes, worked thin, and with a concave surface, very difficult tu forge, and therefore requiring much skill in the workmonship, but of metal so soft and inferior, that they would not have been considered worthy of any notice were it not that they are so made purposely to suit the particular habits of an agricultural population, who mow all crops, whether of grain or others, close to the surface of a soil generally abounding in stones. A scythe of hard steel, with a fine edge, though it might perform its work better where unimpeded, would be liable to constant injury, very difficult of repair, under such circumstances; whereas these Tyrolese or Styrian scythes yield at once to the blows which they receive upon their edge. labourer carries with him a small hammer; and whenever the blade has so far lost its shape as to need renewal, be beats it out in a few moments to its original form; heace the softness of the metal, in most cases considered wholly inconsistent with excellence in this branch of maoufacture.

becomes an essential property.

S. From the States of the Zollverein, and from Hamburg and Mecklenburg-Schwerin, in Northern Germany, there is a collection of articles of almost every descrip-The two latter States contribute only on a limited senle; Mecklenburg some razors, and Hamburg also, to-gether with a small collection of tools, of fair quality, The former commodities are not good of their kind, and I me returner commonatures are in a good to more kind, and those from Mecklesburg apparently very high in price. Of the cuttery from the Zollverein, much, though highly famished, is of an ordinary description, comissing of table and pocket knives in considerable variety; but there are also certain "spear knives," designed for failing by the native in the South American rivers, and adapted for their markets, which descree notice as of proper manative and their markets, which descrees the proper manative their markets and the second of the second of the which carees higher Mall. There is a moestment of of attention as being sammfentered in great numbers from an one producing a "nament artee", which is of of attention as being sammfentered in great numbers from an one producing a "nament artee", which is of the second of the second of the second of the second before the contracting press, there's peaking him to profusible with the criticary methods. The workmanning before the second of t

4. The collections from Dommark, Sweden, and Norway are mail, and comain little that requires notice. From some mail continuous maintenance and the state of the contributions, indicating extabilitients on a very limited design and although Sweden has long produced the most valuable iros, as the rew material of the finest steel and of the most finished rews material of the finest steel and of the most finished rews material of the finest steel and of the most finished made any great advance. The collection consists of some made any great advance, The collection consists of some many limits, Prom Dommark here is one singular article, and the collection of the collectio

apparent utility.

5. Of the three contributions from Russia, one only is from a private individual, the other two are from imperiate individual, the other two are from imperiate installaiments. The former contribute a surried installation of the former or the contribute of the properties of the pro

6. From Spain and Portugal the contributions are very small. The former exhibits only an assortment of files from Placenzia, of very fair quality: the latter, some agricultural implements," consisting of praning-knives and scissors, probably adapted to the vine cultivation, but of little merit as manufactured goods.

7. Of the three States in the next divition, Tarkey, Egypt, and Tomis, the two latter are only slender contributors in this Class. One or two articles contained in the property of the contributors of the contributors of the contributors of the contributor of t

the two therefore produce an entire cone when closed. The sides of each of these halves form the cutting edges. They are well finished, and must have required much-skill and great labour in their fiberication, rendering their cost high; but it does not appear that they possess any superior utility. It is not stated that they are so made for any special purpose; and if not, they involve considerable water of total and skill.

[CLASS XXI]

8. From China there are only a very few articles; but one of them is a singular instrument, and should be noticed, as characteristic of the people from whose workshops it proceeds. It is a small blade of a triangular form, 2\frac{1}{2} inches long, 1\frac{1}{2} inches wide, and \frac{1}{2} inch thick, folding upon a slender wooden cylindrical handle, and is used as a razor for shaving a part of the head, according to general practice among the Chinese. It is not easy for us to comprehend how the operation can be successfully performed with such an implement; but it is said to be in common use among the natives, and to effect its purpose in their hands with the utmost nicety and despatch, and it cannot, therefore, be ill-adapted to its object. The workmanship is, to European eyes, of a very rude description, and even the surface of the metal displays none of the finish which is so diligently bestowed on many Chinese productions; but the edge it curries is certainly good, and its quality, no doubt, surpasses its

9. Lastly, the opposite hemisphere supplies, from the United States of America, a collection which, though not very extensive, contains some signal proofs of proficiency-in such manufactures, and is strongly characteristic of the natural and social exigencies of the people from whom it comes. It consists of a few articles of the finer cutlery, hnt mainly of assortments of the larger edge-tools and implements, such as scythes and axes, and other objects of that nature. The former are finished with great care, and decorated with much costly ornament; but the Jury cannot pronounce them to be of the first degree of excellence in workmanship, and their temper is wanting in the hardness proper to the best cutlery. With resp the other articles, however, the case is different, With respect to is a set of joiner's tools, which, though few in number, are excellent; and the same may be said of the scythes, which are of the best quality. Good as these productions are, they are perhaps surpassed by the axes, to which nothing of the kind can be superior; they are admirably finished, and at the same time display all those more valuable qualities which are the necessary conditions and evidence of perfection in such commodities. It is evident that the great prevailing want of the population has erested and encouraged to perfection, in its own neighbourhood, the trade which was to supply it.

bourhood, the trade wheth as I to supply it.

The Jury believe that in the above general survey of
the contributions presented by this Class of the Exhibition,
they have left mobiling unmeritioned of any note or merit;
they have left mobiling unmeritioned of any note or merit;
interacting features which belong to it, it only remains
for them to add a list of the awards.

AWARDS IN CLASS XXI.

WARRY HEAD FOR THE STATE OF THE

W. Wros, R.A., Her Majesty's Miot Medalist. (Juror in Class XXX.)

In that respect it forms a sucless round which, either wholly, or in certain particulars, various other classes, to the number of seven or eight, are distributed; and which are separated from it an grounds, partly of convenience, and partly of the subjection of metal-working, as such, to the purposes of specific branches of industry or science.

Owing, however, to the difficulty, in many cases, of muking such a separation, the range of Class XXII, has been limited rather with respect to the number of objects embraced by it, than to their nature; among which, in point of fact, there are included examples either analopoint of inct, ineric are instances extampled extact analogous to, or ideutical in illuscential particulars with, a considerable portion of those exhibited in Classes I, V., V., VIII., IX., X., XXII., XXIX., and XXX. Thus, for example, although it belongs to Class I. to determine the merits of iron, steel, copper, or other wire, under the merits of iron, steel, copper, or other wire, under the head of "Metols in their progress to finished manufac-tures," the same wire, when twisted or woven, comes under Class XXII, in which its merits, with this new quality superadded, must again be tested by a rule in-volving a judgment on the moterial itself. Then again, Class XXII. abounds, if not with muchines, at least with machine-like contrivances, and with implements and tools, which identify it with several of the Classes above emme-In the case of metallic sculpture, this identity rated. In the case of metanic scripture, this signality with Class XXX, is especially to be remarked. As a geogral rule, it was thought that the Jury of Class XXII. might with advantage confine themselves to the consideration of net as it is applied to ornamental purposes; but practically it was by no means easy, if indeed it was possible, to define in every respect the limits between ornamental art and fine art; and hesides, it was to be borne in mind, that statues in metal, and other similar works of urt, while they are to be judged of asthetically, are also, as the result of various metallurgie operations, amenable to the criticism of the founder and metal-worker, and may have, in that respect (as the Jury believe to be the case in more than one instance in the Exhibi-

tion) a merit, which, though ant independent of artistic

THE range of Class XXII. may be said to be co-extensive excellence, is nevertheless separable from it. On this with the employment of the baser metals in manufacture. passed under the review of this Jury; and they would remark, with respect to this and other cases, that although their daties would have been lightened by a more exact definition of the limits of their Class, and, in all in-stances to which it was practicable, by a statement of the particular merit on which the exhibitor wished to found his claim to reward, yet the exhibitors of those articles which have nudergone the scrutiny of more than one Jury, will have no reason to complain of an arrangement, which, at the least, must have tended to colarge tha grounds of criticism, and make more fully known their

elaims to notice The phjects included in Class XXII., considered with reference to material, range themselves for the most part

under the heads of :-1. Brass Manufacture 2. Copper, Zinc, Tin, Pewter, and General Braziery.

4. Steel Mannfactures.

The following particulars being comprehended under these heads :-1. Brass Manufactures.

a. Cahinet and general hrass foundery: consisting of hinges, fastenings, escutebeoos, bell-pulls, brass foun-dery used in ships, knockers, door-springs, castors, &c. b. Plumber's brass foondery: cocks, valves, pumps, water-closets, &c.
c. Stamped hrass: cornices, curtain-bands, finger-

plates, &c.

d. Gas fittings, bruekets, chandeliers, pillars, gashurners and consumers' meters, &c. e. Tuhing, plain and nrasmental, f. Metallic bedsteads.

g. Chandeliers, lamps and candelahra for nil, candles, ar camphine, and lamp-chains. & Railway and carriage brass foundery, and signal

lamps and lanterns. i. Bronze figures, busts, and chimney ornaments.

- k. Bells: house, charch, ship, table, &c., and alarums. 1. Candlesticks: table and bedroom.
- Monumental brasses and ecclesiastical brass-work. u. Copper-plates for engravers.
- o. Miscellaneous: including pins, nails, wire-gauze, hird-cages, hooks and eyes, wire baskets, and ropes,
- 2. Copper, Zinc, Tin, Pewter, &c. a. Kettles, coal-scuttles, coppers, sancepans, steamers,
- plate-warmers, &c. b. Brouzed ten and coffee-urns, kettles, &c.
- c. Tubing: copper, tin, lead, &c.
 d. Pewter, German silvec and Britannia metal tenpots, basins, dishes, spoons, ladles, inkstands, &c., e. Coffin furniture: plates, escutcheous, &c.

f. Zine articles generally.

3. Iron-work.

a. Stoves, grates, fenders, and fire-irons, kitchen ranges, cooking apparatus, smoke-jacks. b. Warming apparatus for halls and rooms, ships, &c., either hy water, coal, coke, wood, charcoal, or gas.

- Shower, vapour, air, and warm-water baths. d. Ventilators: metallic and others,
- e. Pipes and gutters, &c. f. Locks and hinges.
- q. General ironmongery.
- Knife-cleaning machines,
- Letter-copying machines and presses.
 Saddlers' iroamungery.
 Hollow ware, cast and wrongbt, tinned, and enamelled.
- n. Spades, shovels, pickaxes, hoes, rakes, gardenrollers, &c. o. Nails: eut, east, and wrongbt.
- p. Screws and railway bolts, &c. q. Iron safes, cash boxes, fire-proof and others.
- r. Horse-shoes. s. Gates, railings, hurdles, and stable fittings. t, Mangles, washing-machines, &c.
- u. Iron bedstends, garden seuts, &c. v. Castings in iron

4. Steel Manufacture. a. Tools and heavy steel toys, hammers, vices, &c.

b. Steel ornaments, light fancy steel toys, brooches, huckles, &c.

 e. Steel pens and metallic pens of other kinds.
 d. Needles, fish-books and fishing tackle. Besides these, there must be included also a number of objects fabricated of mixed materials, such as buttons-

metallie, Florentine, pearl, bone, &c., and other produc-tions coming under the usual denomination of hardware. Considered in another aspect, the articles comprehended in Class XXII, may be divided into those intended to supply the necessary and absolute requirements of large industrial populations, and generally to minister to the conveniences of society; and those which, either partially or wholly, are ereated to meet the demands of taste and refinement among the wealthier classes of the community.

A large proportion of its contents, accordingly, consists of articles of mere ntility and convenience, the merits of which were to be tested by such considerations as fitness for their professed purpose, and excellence of material and workmanship

To these tests the Jury believe it would have been ad-vantageous to have added a comparison of prices; but they found it necessary to abstain from introducing this element into the grounds of their decisions, partly on account of the difficulty of doing so, and partly in deference to the instructions furnished to them by the Council

of Chairmen. They must also add, that, after much deliberation, they felt themselves compelled to adopt a rule for determining the merits of inventions, and of improvements on existing contrivances, which, in many cases, they admit to have been inadequate. Numerous instances, of course, ther were of contrivances in which the adaptation of the

means to the end was so obvious, that no question could be made of it. Others there were in which the actual wurking of the invention was witnessed; but there was a third class, respecting which the decisions of the Jury, it was felt, must be pro tunto, conditional and contingent on the efficacy of the contrivance, unless and this was considered to be impracticable—they were cuabled to form an opinion after actual experiment,

This question was, in the first instance, raised in the case of lamps for oil or campbine, on the occasion of a ossultation between this Jury and the Jury of Class XXIX.* on that point; and it was subsequently decided, in the first place, that there were practical reasons, which it is here unnecessary to state, against nadertaking a course of experiments on the comparative advantages in point of economy and the illuminating power of the lamps in question; and, secondly, that supposing it to be otherwise (though indeed the same or similar ubstacles existed in other cases), the Jury must, in fairness to exhihitees in all the sections of this Class, have resorted to

experiment where any doubt arose, and thus have protracted their labours to an inordinate length, Among the cases to which the Jury refer, they may advert more particularly to contrivances for presenting smoke, kitchen ranges, professing great economy in fuel and other advantages, apparatus for heating and cooking by gas, and such like.

In some instances, indeed, experiment would have rendered no assistance. In the manufacture of steel pens, for example, the improvements introduced by parpens, for example, the improvements introduced by par-ticular houses (beyond a certain point of excellence long since passed by all) are, for the most part, merely differ-ences of form, on the advantages of which, adapted as they are to sait different characters of hand-writing, very few persons would be found to agree. With respect, however, to all the cases to which they refer, the Jury believe that, short of actual experiment, they have neglected no means by which they were likely to arrive at a sound conclusion. And besides, it must not be forgotten, that even in these and similar instances, the invention or contrivance is not the chief, nor always the sole element of merit on which they were called upon to pronounce a

Next in order to articles of mere utility and conve-nience, may be ranked those in which use is combined Thuse cutte with a greater or less amount of oreament, stitute the largest proportion of the objects in Class XXII.; besides which there is a third section, which consists of articles either solely or chiefly ornamental; including such works of fine art as are or may be employed for decorntive purposes.

The whole number of exhibitors in this Class is up-

wards of 1,200, including those who, chiefly exhibiting in other Classes, have also sent articles which more or less come nader the denomination of bardware. This number also includes exhibitors of certain objects, such as metallic combs for weaving, and mangles, which were mately referred to other Juries.

The proportions in which various countries have con-tributed examples of all kinds may be gathered from the following statement of the relative number of exhi-

Two-thirds of the whole number of contributors belong to the United Kingdom; the other third are thus distrihuted:-

From France -- about one-fourth, From States of Zollverein - - rather above ditto, Front Austria - - - about one-eighth. - - - about one-sixteenth. From Belginm From Canada - ditto ditto From United States of America - ditto

And the remainder from India, China, Denmark, Spain Sweden and Norway, Russia, Switzerland, Jersey and

Guerascy From the extreme difficulty of classifying so multifa rious an assemblage of objects as are included in this department of the Exhibition, an approximation only can

* See Appendix (A.), page 510,

be made to the proportions in which British and Foreign exhibitors have contributed examples in specific branches of industry; but the following table will, perhaps, suffice to show how the case stands with the more noticeable kinds of mannfacture:—

NUMBER of EXHIBITORS, Barrien and FOREIGN, of the principal objects in CLASS XXII.

The foregoing table includes those case only in which can be sufficient for the substitution of the substi

On a general review of the contents of Class XXII., the Jary observe first, that although the contributions from the United Kingdom are twice as great as those from all other countries, and, with trilling exceptions,

monist of examples in all hembers of metallic manefuncts, the character of the contributions were in indicate merce, the character of the contribution was not indicate pre-estimate for excellence of workmaning and materials, pre-estimated for excellence of workmaning and materials, and the contribution of the contribution introduced in any other contribution in the contribution in the contribution of th

nerit of British productions, though very unequal, is, in the whole, less pre-emineut. Whatever amount of vidence there may be that the persons who furnish the lesigns are deficient in artistic education and intelligence, seems to be almost beyond question that the inferiority f British hardware, in point of taste, is, in many inmoces, more immediately traceable to other causes. One of the chief of these the Jury conceive to be the artistic gnorance of workmen. There may be observed everyhere the fruits of a disposition among artificers to con ider the duc development of artistic design less important han a kind of mechanical high polish and finish, which re in all cases thought to be essential to excellence of re in all eases timing it to be essential to executence of rorkmanship. The Jury are hy no means disposed to undervalue beauty of workmanship; on the contrary, hey consider it essential to the perfection of manufacure; but it is quite clear that in proportion as tasteful lesign becomes an element in that perfection, mechanical levelopment. Unless this subserviency he strictly mainained, no amount of skill on the part of the designer can wall. Accurate modelling, for instance, of the features sorkman, prepossessed with his poculiar notions of finish, to be at liberty to obliterate both festures and toes ofore he can attain the degree of polish which he deems reditable and necessary In the cases to which the Jury refer, it is obvious that

he deficiency arises from a want of proper understanding setween the designer and the parties who execute the ork. In an early stage of society, - as indeed must dways, to a great extent, be the case in the highest kinds of art, -the artist and artifleer, the designer and manufacturer, are the same individuals. This state of things, though on the whole highly favourable to the influence of taste on works of industry is incompatible with low prices, or (which is the same thing) with extensive production. In particular, the difficulty and tediomeness of the mani-pulation of materials so unyielding as metallic substances, while they place a limit on production as it respects quantity, have a tendency to confine the character of the things produced to the two extremes of rudeness and elaboration. So long as the chenpness of an article was attained, not by increasing the mechanical facilities for its production, but by diminishing the amount of handlabour bestowed upon it, metal-working, so far as the mass of the people was concerned, could never extend itself beyond the few indispensable requisites of everyday life, which, to be cheap enough, must be of the rudest description,-such, in fact, as we still see in the specimens of household and other ntensils among the Oriental manufactures now exhibited. With respect to the wealthier classes, on the other hand, the inducements lay in the opposite direction; it was the interest of the artificer to enhance the value of his productions by claborate and varied workmanship of an ornamental kind, for which alone he was likely to obtain adequate remove ration. Thus every single production, on which labour

heyond a certain indispensable amount was bestowed, artook more or less of the character of a specific work of art, identified with the prodocer as an artist, and reproducible only by a reiteration of the original process by the same or equally competent hands.

It is not difficult to anticipate the effects which the substitution of machinery for hand labour must produce on this aboriginal character of industry. However great the improvement likely to arise, both with respect to quality and cheapness, in the fabrication of objects of utility, it was inevitable that, for a time at least, a deterioration should take place in ornamented manufactures. The old relation, or rather identity, between the artist and artificer must cease to exist under a system, in which the application of ornament depended no longer solely on the skill of individual artist-workmen, but un the capabi-lities of mechanism, or chiefly so. The influence of lities of mechanism, or chiefly so. taste, accordingly, had to be exerted by new methods. which, from the accessities of the case, could only develop themselves slowly.

In the first place, the earliest efforts of machine labour are directed to the production of objects in their simplest and least ornate form. Imperfection of unachinery, and the primary parpose of machine labour, viz., cheep and extensive production, both tend to impose this condition, and to impart to manufactures a mechanical and americatic character. It is not only the interest of the manufacturer, but matter of necessity, in the first instance, to exclude whatever cannot be easily and cheaply executed; and thus, on the application of muchinery to any new hranch of industry, there occurs in almost every case an interval during which the services of the designer are reduced to their minimum, even if they are not, for the time, virtually dispensed with. But apart from this consideration, it is to be remarked, secondly, that the appli-cation of machinery brings with it new difficulties to the way of taste. On the one hand, the conceptions of the designer are not, as before, limited solely by his skill as a workman. The capabilities of each particular process of manufacture have now to be studied; and the adaptation of design to these, forms, of itself, an art of considerable difficulty and of slow acquirement, fettered as it is by questions of economy in execution, and embarrassed and impeded by continual improvements, or, at least, changes in the machinery or process employed. On the other hand, the mise on fabrique and the finishing processes, if they do not necessarily in most cases fall insu the hands of persons artistically disqualified, do so, at least, in the first instance; and this obstacle to the due execution of ornamental work not only becomes inveterate by use, but has mistaken views of economy in favour of its perpe-

It is, at least, a fact, that while the application of ornament to many hardware manufactures has gradually become more extensive and of a higher order, the character of the individuals employed in the workshops, with respect to artistic intelligence, has not been proportionably elevated. They, for the most part, retain the ideas ably elevated. I ney, nor the most part, resum are success belonging to the primary, mechanical, and generally suggressize condition of manufactures. While our de-signers have advanced, those who execute or finish their designs have remained stationary; house the appearance, of which the Jury have so frequently had occasion to notice instances, of a mechanical high polish, which has obliterated or spoiled tha details of form or surface, evidently intended by the designer.

This is not, however, an evil peculiar to the hardware manufactures of this country. In France, in particular, some years ago, the artistic ignorance of the workmen employed in the chiselling and finishing of bronze and er metallic wares, was found to be so serious an obstacle to improvement, that it was considered necessary to establish a school for the express purpose of affording to artificers instruction in drs wing and modelling, com bined with the practice of chasing, chiselling, and finishing castings in metal. And it may be noticed, that the Trudes' Schools of Prussia and Pavaria are expressly based on a recognition of the principle, that if the modern exigencies of manufacture require a separation between

in no other way be duly maintained, that hy teaching to the artificer so much of the design as will coulde him to appreciate the intentions of the designer; and to the designer, so much of manufacturing processes as will secure the practicability and fitness of bis designs.

The Jury are, however, by no means inclined to take a discouraging view of the position of the ornamented hardware manufactures of the United Kingdom. There was no reason to expect, on general grounds, that an entirely new system of manufacture should be perfected otherwise than gradually, or be exempt from the characteristics of procress which have always marked the advancement of art and industry. All experience would have been belied, had the progress of Eugland, the parent of this new system, been other than it has. Our industrial system has been gradually and entirely remodelled. Step by step as machinery, and the various reproductive facilities of modern times, made their eneronchments on the old methods of hand labour, we were, in every case, as it were thrown back on the primitive condition of labour. That very want of skill and inexperience which, in early stages of society, oblige men to busy themselves sulely or chiefly about the necessary, the useful, or the convenient, restrained the earlier efforts of mochine labour, and gave it the same bias. And if we consider the vast commercial advantages reaped by this country from approximented machine-made wares, and that the deterioration of the ornamented sorts was, and is now, tu a large extent, connecreially speaking, of no importance, because counterhalanced in the eyes of the majority of purchasers, by other qualities more easily appreciated, we shall be at no loss to account for the present general inferiority of British hardware, in point of taste, to that of some other countries. It is obviously an inferiority, not so much positive and permanent, as arising out of a particular stage of progress. Commercial interest has not yet, in this country, forced on manufacturers the consideration of questions of taste, to the same ex-tent as has been the case elsewhere. It is only, indeed, within comparatively a few years, that the national success in the market has been experally even suspected to be endangered by want of tasse.

If, then, the due adjustment of the mechanical and the artistic elements of perfection in manufacture is a problem yet to be solved in this country, it is because the point of progress has not yet been reached at which its solution becomes possible; if that solution has been postponed beyond what may appear a reasonable peried, it is because the mechanical element, bringing with it new and unbeard-of advantages, commercial and utilitarian, has been borne along on an overwhelming tide of success, and carried beyond its proper bounds, closing up for the time, or obstructing more or less the avenues to the influence of taste. If due means for securing that influence have not been used, or only partially so, it is because the commercial necessity for using them has been either not felt at all, or felt partially. But there is nothing unhealthy in this state of things; the atmost that can be said, s. that the manufactures of the United Kingdom, with respect to trute, are in a state of transition. artistic element has began to assert its claims; and if its working is for the present necertain, irregular, vague, and unequal; if British manufactures exhibit for present, at once the most successful and the most abortive attempts at ornomentation; if the means used to obtain designs are often erroueous and illegitimate, and the modes of working them inadequate, it is the consequence of a state of transition resulting from the introduction of a new, and in some respects, autagonistic element, which has not yet secured its position,

These observations will, in part, have anticipated some of the remarks which, in the second place, the Jury have to make on the general aspect of the objects contributed to Class XXII., by the more eminent continental nations. It must be upticed, however, in addition, that as the iudustry of the United Kingdom owes its existence to private enterprise, so its course has been determined solely by commercial demand, and the current of ingethe designer and artificer, the influence of the former can sion in certain directs as; but its condition is, to no appreciable extent, traceable to the direct fostering care. or to the controlling influence of the Government. It has taken its own course. It is a vigorous and independent manufacturing system arising out of the substitution of machinery for hand labour, wherever it was practicable; a system which, not only impelled by necessity, but induced by interest, developed itself solely or chiefly in the first instance in the direction of the indispensable. the useful, and the convenient; and which, by a natural progression, is tending towards the ornamental; and is now, in fact, exhibiting signs of the fermentation consequent on the insertion of the new leaven of taste and Whatever its progress in particular cases, it refinement. has followed this course on the whole; and in this respect it presents a contrast to the industry of some of the more powerful astions of the contisent of Europe. That of France, in particular, may be said to have proceeded by an opposite course. It started with an artistic system of manufacture, patronized and supported by Government influence and resources; and its progress has, for the most part, been downwards from the supply of the artificial demands of luxury and refinement, to the necessary demands of ntility and comfort. There can be no question whatever about the pre-eminent excellence of the national ornamented manufactures of France: but there is as little doubt that, commercially considered, this pre-eminence is to a great extent arunerally manuscone. It is not so much the result of a healthy, independent, self-relying, and self-supporting system of manufacture, of which machinery is the basis, and which owes its existence to private enterprise and capital, and its direction to commercial demand, as of a patroaage and an expenditure, which disregard both cost and immediate profit.

The Jury, however, must not be considered to offer any opinion here to the quotien where the it is activable in position here to the quotien where the it is activable in an arcsource to the promotion of create branches of industry, or to position meet articly, should amongolize the position of the promotion of the property of the statestion to the fact that this is done in Prince, and some other continents contract (see for example, in Presista), because they believe that a strong characterise of Prosetterior article, ranches that a winner planswheride of Prosetcetured article, ranche than workmankler. 1. BRASS, COPPER, ZINC, AND TIN MANUFACTURES The brass-work of the United Kingdom is particularly distinguished for that beauty of workmanship which i generally characteristic of British wares. Excellence of material, solidity, brilliancy of polish, and flatness and equality of the "dead" or "frosted" portions, admirable fitting of the joints, and a certain appearance of thorough genumeness, are qualities pervading all the productions in this material exhibited by the manufacturers of Great Britain. These qualities appear to great advantage in certain hrunches of industry which admit of a moderate amount of ornamentation, in the shape of mouldings, twisted columns or tubes, corner-pieces, perforated plates and the like, which muchinery can readily execute. soch cases, in addition to very perfect workmanship, there frequently appears considerable evidence of a feeling for harmouy, and for a just proportion and ar-rangement of parts. Eminent examples of work of this character occur in the collection of brass-work (chiefly bedsteads), exhibited by WINFIELD (373, pp. 639, 640), of Birmingham; and in the Mediaval Court, among the ecclesiastical brass furniture and atensils contributed by Messrs. Hardan (700, p. 668), also of Birmingham, which are remarkable besides for the perfect intelligence with which the ornamentation (eutirely Gothic) is designed and executed.

Brass-work of a character solely or chiefly ornar can scarcely, however, be considered to be on the whole in a very advanced condition. There are numerous examples of excellence in nearly all branches of industry employing this material; but there is, perhaps, scarcely any collection which displays throughout, whatever may be the amount of orunneutation, a uniform good taste and intelligence in design. It has been said that the vulgar taste in which certain articles are designed and executed finds admirers for whose predilections it is the interest of the manufacturer to provide; but the Jury believe that, even admitting the existence of a vicious taste among consumers, and giving due weight to the motives of self-interest, which of necessity actuate pre ducers, that policy is very shortsighted, which, for the sake of a partial present advantage, sacrifices the general success of a branch of industry. They consider it very doubtful, besides, whether those who act on this view. do not in reality underrate the tastes of those for whom they profess to provide. Instances illustrative of these obexcursion will be found among the insuscensite angilartion of behaviors, the which the we of gas has price tive; such as fittings, benefets, ped-stal barrows, chandeliers, table-laung, Ac, both, for douncil use, for above, and for public buildings, all of which are of excellent and substantial bordermannials, but many survited by a victous nates and the absence of article knowledge, the start of the state of the state of the start of the s

ing is napose.

In the suppose of th

process of execution.

Bells and gougs coming to a certain extent uader the description of Musical Instruments, the Jury considered it advisable to request the assistance of the Sub-Jury A. of Class X., who obligingly communicated to them a Report on the merits of the various bells exhibited. This

Report will be found in the Appendix (B). The ornamental brass-work of French manufacture, which, besides being the largest contribution from any foreign country, cuters most successfully into competirally remarkable for skilful and varied artistic treatment. It differs from the British rather in the uniform intelligence with which the ornamentation, whether little or much, is designed and executed, than in the absolute superiority of individual examples. The ornamentation is of every kind: ranging from profuse and heavy scroll-wark to decoration in low relief; but there may be remarked, is particular, a taste for a peculiar treatment which produces a riehly-studded or jewelled effect, with sharp, clear, and decisive shadows, approaching to the character of the work termed Elizabethan. The introduction of colour by means of jewels in paste, by cnamelling, or hy a difference of metal, is more frequently taken advantage of hy French than by British manufacturers. By these aids, and the carichment of surfaces by ornaments of a similar character, a picture-sque and frequently brilliant effect is imported. In careful finish, however, much is to be desired; the joints and fittings of separate portions being often so clumsy and unworkmanlike as to create dissatisfaction on a near examination. This deficiency may be exemplified by a comparison of the ecclesiastical hrase-work exhibited by Poussieague-Rusann (France, 1405, p. 1243), with articles of a similar character in the collection furnished by Mosars, Hardnax, of Bir-mingham (532, p. 701), in the Mediaval Court. In this instance, besides, the French productions display far less intelligence in design than the Euglish; the foruer being imbued to a considerable extent with the peculiar character proverbially, though now improperly assigned to Birmingham work; while the latter is entirely devoid

On the broates and small ornaments of mixed materials, predder, dilute and vasor for flowers, the, are most which have been made in timing exhibited in great profusion, and on the whole ment is likely to supervise the use of cope high censum-halom. The spirit, lancy, and inversion poset; the objections formerly under they display are unboanded. Here again the roment is in seight and the risk of fracture, havin applicable, that single examples on the British side, for if yet substitution of sheet for east iron,

instance from the collection of J. A. Harrman (13), and the solid Thr. (Charles Data Clearly, Chi 19, 600, 601), say be placed able by add with many of the solid Thr. (Charles Data Clearly, and the solid Data Clearly and the solid Dat

The examples of zine manufactures, castings, and galvano-plastic productions are more numerous from France, Belgium, and the States of the Zollverein, than from Britain. In this country the use of this metal has hitherto been chiefly confined to the manufacture of household utensils and conveniences, such as baths and vessels for calinary and other purposes, for alloys, galvanizing, and coating other metals, and as a substitute for lead in the roofing of houses, &c. On the Continent, in addition to the application of zine to purposes of utility (which is earned on to the same, perhaps to n larger exteut), the metal has also within the last few years been pretty extensively employed as a substitute for broaze in casting statues and other objects of art both on a large and small scale. For this purpose it appears to affer considerable advantages; though it may be doubted whether experience of its use is as yet suffi-cient to warrant a very decided judgment. The effect, huwever, of these castings, whether with a surface of zine or with another metallic coasing, is in general good; and at all events, the cheapness and comparative lightness of the metal seem to be in its favour as a means of forming chesp duplicates of objects of high art existing in the more coasts materials of bronze or marble. The specimens exhibited by GESS (1 Zollv., 267, pp. 1063, 1064), and DEVARANKE and SOX, of Berlin (1 Zollv., 280, p. 1065), by Madame De Braux D'ANGLUSE (France, 779, p. 1918), and be the Braux D'ANGLUSE (France, 779, p. 1218), and by the Brigian Societé de La Viguite Montaune (Belgium, 26, p. 1152), are the most noticeable. The latter, in particular, have most fully and successfully exemplified the various uses to which zinc successfully exemplified the various uses to which sinc may be applied; and the specimens exhibited are calcu-lated to utford useful bints to the manufacturers of the United Kingdom. The use of zinc for preventing the oxidation of iron, its aptnesss far perforation, and its general application to domestic purposes, are already recognised in this country: but it is obvious that on many accounts it may be advantageously employed to a larger extent, especially in cases where the unyielding character of iron, and the high cost of copper, present obstacles to their use. The Jury believe that xine has been scarcely, If at all, resorted to in this country fur statuary and the easting of small groups of figures and

2. IRON AND STEEL MANUFACTURES, IBUNMONDERY, &c.

The iron manufacture of the United Kiugdom may justly claim a very high place. The advantages afforded by a material so chesp and abandant are indicated by the vast extent and variety of its uses; and it may be safely affirmed that no brauch of industry, cusploying iron, need ever languish on account of any scarcity, dearness, or meetimatry in the supply of this important metal.

The whole collection of steel and iron grates, fenders and fire-places, kitchen ranges, stoves and apparatus for warming and ventilation, is considered by the Jary to constitute a most interesting, and on the whole, a highlyereditable and satisfactory exhibition of the state of those hrnnches of iedustry in the United Kingdom. In that portion of it which includes tasteful design as an element of merit, the Jury regret to find instances in which a deficiency in that respect is but too apparent; but, on the whole, they are disposed to consider the manufacture of ornamental drawing-room and other grates and feeders, and decorated stoves, to be in a most promising condition in respect to taste. The grates of Mesers. HOOLE, ROBSON, and HOOLE, of Sheffield (140, p. 609), executed from designs by Mr. ALFRED STEVENS (140, p. 609), and those exhibited by Mesera STUART and SMITH, of the same place (102, p. 603), may be adduced as evidence of remarkable advancement in tasteful design The former display great beauty and artistic intelligence, while the latter, in some instances less eminent in those respects, are remarkable for general brilliancy of effect, great precision and excellence of workmanship, and certain novel applications of ornament. The Jury wish to notice, with special approbation, those portions in the grates of Mesars, Hoole, Robson, and Hoole, in which the costings remain in the state in which they leave the

The pograms of this manufacture is all respects in the more translated, considering the steeper of foreign more translated, considering the steeper of foreign elepted since it began to assume in present highly-decretive chapters. It is any justice the off the san, or related to the construction of the steeper of the conincidentry was introduced into Sidefield. The Jury think it descring of notice with respect to this branch of industry, that in all the communications which have been made to them by the persons empaged in it, they find observations commendatory of the School of Design in Sheffletd, and expressive of the high sense they cutertain of the services it has rendered to ornamental art, and in particular, to the manufactures of that place.

The articles of this description exhibited by continental manifacturers are few in number, being chiefly stoves; amongst which the grate contributed by Assumition (France, 1035, p. 1279), and calorifores in brass and east iron, by Laura (France, 563, p. 1205), are the most descrining of notice.

From the United Kingdom, examples of the ordinary to the consumer of their chain to kitchen range are sunnerous, and autientally characterized that advantage, if other nore necessary conditions are by a sound not substantial workmanable. On the actual condition, which is the woold appear that make the actual condition of the co

working merits of the various contrivances and arrangemeuts displayed by them, the Jury do not feel themselves qualified to form a very decided opinion. They would, however, observe generally, that in many cases the massiveness, extent, and heavy character of the iron-work appear to be carried to excess, and a wider space conctimes assigned for fuel than is uccessary, or consistent with economy. It is, doubtless, very desirable to give such a degree of strength to a kitchen range as shall insure it in all its parts against injury from fracture, which is in most cases difficult to repair; and, hence, economy of material is not to be regarded as a primary consideration; hat the difference between the large extent and mussiveness of some ranges, and smallness and chest-like appearance of others is so extreme, while the professed possibly the real capabilities are about equal, that it is evident we have not yet arrived at very distinct conclusions respecting the exact adaptation of the means to the end in this branch of industry. Much of the variety in size, and as a consequence of this, in arrangement, is no doubt due to the necessity of providing for the dif-ferent sizes of kitchens and fire-places; a necessity which must, on the whole, tend also to maintain high prices. It must be admitted, besides, that obstacles to improvement and the speedy adoption and testing of new contrivances arise out of the arrangements current in England between hadderd and tenant. A kitchen range comes under the description of what are termed "land-lord's fixtures," and in many, perhaps the majority of cases, has been selected more on the ground of economy in the first outlay, than with any view to the excellence of the contrivance or the permanent comfort and con-venience of the occupant, who, though dissatisfied, finds it difficult on several accounts to disturb the agreement he has come under.

In Scotland, grates are the property of the occupant, but it is doubtful whether this circumstance contribute on the whole, to improvement. A large majority of tensatas are more able to pay annually a small addition to their rent as interest for the outlay of the landlord on grates, than to incure that outlay themselves; and hence with such persons, economy outweighs all other considerations.

Taking all the elementations into account, the Juny than that the the strategy constitution of the specific that the third that the strategy constitution of the specific time of one which, compact, nodernete is rise, reconceil, the strategy constitution of first, and its conditionation of the store and one strategy constitution of the store and
The Jury observe with regret that there is no cooking store or apparatus of first-star manufacture or exteut exhibited among the productions of the Continue. Foreign boths and large establishments must be translated with such; and it certainly would have been look interesting and interactive to our month daws been look interesting and interactive to our manufacturers, to have on a large scale is conducted in constries remarkable for their enalizary about

The contrivances recently invented for cooking and hesting by gas, of which a considerable number are exhibited on the British side, appear to be well made and constructed, but the Jury are manble to personance any united opinion on their efficiency. The chief advantage professed by them is economy; and there seems to be no reason to doubt the justness of their claim to that advantage, if other more necessary conditions are unquestionable success has attended the application of gas to warning aportisents, those to colong, or bearing water for haths. It would, however, be unreasonable catefully recorded to the colonial of the catefully recorded catefully fewer, with an experience on limited as we now possess of the conditions under which it may be readered variable; and the Jaray econditing refer to these convariable; and the Jaray econditing refer to these contended to the condition of the control is member shelver, can hathly be over-estimated to fit is member shelver, can hathly be over-estimated.

Casting in irou forms a large and important branch of industry wherever the advantages of iron and fuel are ossessed to an adequate extent. Owing to the variety of coal-fields, abundance of the mineral, and improved modes of smelting. England is distinguished above other nations for the exuberance and cheapness of her supply of iron, and for the extent to which it is employed in casting. If, however, the quality of articles produced by easting be considered, the contributions from France, Belgium, Prussia, and Austrin, will show that she has powerful rivals to cootend with in that respect. The iron custings from these countries display a sharpur cleanoess, and closeness of texture, and a good taste and intelligence in design, which afford much reason to doubt whether any pre-eminence can be accorded to this country, except so far as mere quantity is converned. It is, of course, not to be forgotten, that the comparison can only be made within certain limits. The iron castings of this country, if they do not actually take a wider range than the continental, do so in the Exhibition: but still if the comparison be confined to objects of a similar character, the Jory believe that the palm of superiority must be assigned to the continental specimens, which on the whole are distinguished more highly for skilful eastlng and intelligent and appropriate design. Among the most eminent in these respects they rank the cast-iron bedstead of J. P. V. Anoun (France, 1053, p. 1229), which is exhibited to the state in which it comes from the mould, as a pure casting to which the file has not been subsequently applied. The founder, in this instance. has succeeded, either by attention to the quality of the sand, or to the temperature of the metal, in producing impressions of the most beautiful distinctness. Some of the castings of Money (France, 1666, p. 1256) have also much elegance and lightness. It may be added that the railings, and generally the iron castings exhibited on the French side, are light and graceful in appearance; and the Jury believe it extremely probable, that if the iron founders of France, with their facilities for obtaining tasteful designs, enjoyed the advantage of a larger supply of cheap material—either by improvements on their mode of smelting, or by the removal of impolitic restrictions on the importation of foreign iron—they might, besides greatly increasing the demand at home, become successful exporters to this country, where orna-mental castings of really excellent design and low price are hy no means largely supplied.

THE BOALD PROMISES IN SPECTURE (I Zelley, 287). LOST JUNE 20, 100 (1) also which speciesous of necessing of a very proposed processing of a very proposed processing of the proposed pr

spirited and beautifully cast.

A bust of the king of Spain, cast at the Boyal Onsiance of Tauria, may also be noticed on account of the delicacy and precision of the impression (Spain, 280, p. 1347); and for the same reason, bust of the king and late queen of the Belgians, by the firm of Van den Branches and Co., of Brussels (Belgium, 363, p. 1162).

The iron casting of the United Kingdom, though already, as has been observed, of great extent, might doubtless be more largely employed for purposes both of use and ornament. It is probable that the expense of new moulds, the difficulty of obtaining appropriate de-signs, and a prejudice existing against irou on account of its liability to fracture and unidation (though the latter fault may possibly be obviated), present io many cases must may possessy us contrained, present to many cases obstacles to its more extremive use in construction and deceastion. That it is susceptible, in easting, of the most perfect and sharp impressions, is clearly evined by the examples already ordiced; and the successful rendering of Mr. J. Brall's status of "The Eagle Slayer," by the COALBROOK DALE CONTANT (641, p. 659), shows that the cost of many public munuments might be reduced by bringing into use, as a substitute for bronze, a material try. On the whole, and more easily procured in this country. On the whole, and considering the comparative merits of British and foreign iron casting with respect both to execution and design, the inferiority of the former may be said, as in other cases, to be general, and on an sverage rather than special. There are examples from the United Kingdom which, in all respects, may challenge comparison with the productions of any country; but the average merit of British iron castings of so ornamental kind is lower than that of France or Prussia; and it will probably be found that the pre-eminence of those countries is due rather to the employment of better artists for the preparation of designs, and artisans more intelligent in design, than to any superiority in the mere process of easting. In other respects, some of the continental nations labour under disadvantages which do not affect the United Kingdom; and if our iron castings are io any respect inferior, the blame rests with our founders, wh rglect to avail themselves of all the means necessary to the perfection of their art

In the manufacture of locks, Wolverhampton still sastains its ancieut reputation. Excellence of workmanship, lowness of price, and an adequate degree of security, characterise the contributions from that place, and prove the advantage of the peculiar division of labour which is adopted in the manufacture. The specimens of locks throughout the Exhibition generally evioce that the art is in a very advanced state, both here and on the Cootinent; hut still it is impossible for the Jury to ignore the fact, that the present condition of lock-making is traceable to English ingenuity and invention; and they believe that on the whole the collection of locks on the British unit on the whole the conjection of focus on the prints side deserves the place of pre-emissione, The lock on the very well-made safe of SOMMERMETER, of Magde-bourg (I Zollv., 802, p. 1094), may be ooticed honour-ably; and the bank lock of Messrs, Dav and Newell, of New York (United States, 298, p. 1453), is remarkable for ingenuity of principle, and for combinations and arrangements which seem to reader it impreguable. Locks of this description, if they could be sold at a moderate price, and made available for ordinary pur-poses, would no doubt be favourably received, and remunerate the inventor. It is, however, a serious objection to any lock, notwithstanding its ingenuity and security, that the key should be so pooderous and holky as to require for itself a separate place of deposit and safe keeping. The smallness of the key in proportion to the size and strength of the lock is particularly remarkable size and strength of the lock is particularly remarkable to the locks of Messrs. Branasi (653, p. 664) and of Messrs. Chuza (646, pp. 663, 664), besides those merits to other respects, which public opinion has so long and

so amply recognised.

Outher comparative security afforded by the various Ooks which have come before the Jarry, they are not prepared to offer an opioion. They would merely express a doubt whether the circumstance that a lock has been picked under conditions which ordinarily could scarcely ever, if of all he obtained, can be seasouted as a

test of its insecurity.

In connection with locks, the Jury may refer to iron
stafes and treasure-chests, of which a large number is
exhibited, and which for the most part are of about equal
merit, so far as the chances of security offered by them
are coocerned. It seems doubtful whether much of the

ornamentation and expensive polithed work which seme of them display, might not be dispersed with. Any addition of that description to the expense, necessarily considerable, of a safe or treasure-box seems gaine gratuitons, more especially since it has become usual, and is considered most secure, in large banking and other establishments, to preserve safes in fire-proof rooms or vaults, into which they are lowered at the close of

The locks and general ironmongery of France are inferior in many respects to the productions of the same kind from other continental nations. There appears to be a desire to extend manufactures in metal, but it is rendered powerless by the restrictions imposed on the importation of the raw material into France. It is impossible, under present circumstances, for the muonfac-turer to reduce the price of his productions to such an extent as to afford him adequate remuneration. Since 1844, the mannfacture of iron-tin plates and steel has been more than doubled in the United Kingdom. This, on the one hand, has reduced the price of the raw material, and, on the other, has stimulated those engaged in working it up to supply their goods at a cheaper rate, and to find new markets. This branch of industry, secordingly, with us presents a healthy and growing which contrasts strongly with the stunted condition which seems to characterise the corresponding manufactures of France. On the stall of JAPT BROTHERS (France, 275, p. 1190) the Jury find several articles of tin-ware manufactured from the most expensive charcoal iron, in a mode that so far economises labour, as to overcome the formidable expense of the material :- machinery enabling them to sell a saucepan for 6d, which is made from charcoal irou at 304, per ton. But in other cases, they are obliged to use the same costly iron without the facilities afforded by machinery, and the consequence is, that prices are too high to insure a large consumption, and industry stagnates.

The enamelled ware of Paris and the coating of its by the ower process of Boccusia (France, 276, p. 1217) both appear to be deserving or notice. The process by which the former is produced has been enaphyed in this coantry who find it extremely valuable as a preservative of their who find it extremely valuable as a preservative of their these from the action of water in locensitive bolines; iron tables being variously affected by the different qualities in Austria and the Zollevice Status on largely employed in Austria and the Zollevice Status.

The ironmongery trade of Germany and the States of the Zollverein exhibits far greater activity. The contributions from Iseriohn, Hagen, Barmen, and other places in Westphulia, indicate the existence of a large and profitable industry; and the difference between the price of ateel and iron goods in these countries and Birmingham is pot so great as to affect its growth and strength. To all parts of the world, and even largely to England, common articles for sale rather than use are exported, and ire vended by hawkers and pedlars through this country. The higher cost of the raw material in Westphalia is com pensated for by the cheapness of labour, and the manufacture being an ancient, not a modern one-Westphalia. having for ceoturies been celebrated for ironmongery and tin goods-the common wares sent to this country are sold at very low prices. On weighty articles of iron, however, such as anvils, vices, and heavy tools, the difference of price between Sheffield or Birmingham and Hagen, is about the amount per cwt. of the duty on iron; and such articles as these are accordingly precluded from competition with the British of the same description in foreign markets.

A new ties of abest-iron, prepared by a conting which imparts to it a sarface that takes freely the mark of a slate-percil, is exhibited, from Wartenberg. It is much lighter and much less links to injury than common slate, injury to the state of the slate of the slate of the day purpose. Along with this may be noticed a slaquist interation of the plaidility of slate-iron exhibited by T. I. Panasan (France, 952, p. 1225). It is a quart without the slate of the slate of the slate of the slate without property of the slate of the slate of the slate of the value of the slate of the slate of the slate of the slate of the value of the slate of the slate of the slate of the slate of the value of the slate
instead of the heavy cast-iron bottles now used for that

Among the manufactures of iron rest from the Contineut, none are more remarkable than the hand-made units of Belgium. This branch of industry in Belgium is of very large extent -- no less than fra 8,000 to 9,000 tens being exported annually, principally of the small sizes called "Flemish tacks."

Belgiam approaches more nearly than any other country to the l'ittel Kingdon in the quantity and price of its irea; the difference in factor of the latter averaging about 20s, per too on the principal sarso of iron. It is worthy of notice, however, that the price of "mail-reds," the kind used in the naturalterior of stalls, is lower in the kind used in the naturalterior of stalls, is lower in that a constant and regular demand for one description of iros will not only justice its supply that diminish its cost possibly by the indocrement held out to the exercise of injusting on the means of economising the cost of progressity on the means of economising the cost of pro-

The sorted samples of hand-mode nails exhibited by the Societi's ASONNER DE COUTLEAT (Belgium, 190), were considered by the Jury to be so excellent in every respect that they were desirean of secroting to that Society the highest, mark of commendation in their Society the highest, mark of commendation in their circumstance that M. F. Spinich, Provident of the Société de Cossillet, is also one of their members, and on that acrount previoled from entering into competition.

The hand-made nails of Austria, which do not appear to be exported to sop extent, are slow of excellent quality, and remarkable for a peculiar rwise given to the shake of the sail, which is sail grantly to increase its teaching, generally, in the United Kimpdom; but its application to the small sizes, luckshing those treemed "pointed or the small sizes, luckshing those termed "pointed or Paris," is shown only in the samples from Austria. Of there, the predictions of the exhibitance belonging to the contraction of the children of the child States must also be referred to. This radie is of very great importance:

CONST DIMEN (148, p. 1003) deserve partnersar notice. The machine-mode aniso of the 1 time dates must aim at The machine-mode aniso of the 1 time dates must aim at the least from 33,000 to 40,000 ions being namefactured anomally. For this and other purposes, such as ship-building, beiler-making, dec, large quantities of cheap iron are imported from Great Britisa, which owing to the wide extent of American see-Joand, can be supplied to most of the southern satter of the Cision, at a chapper sylvania and in Great British the same at the works. With trayest to articles of a insectlateous description,

the Jury must refer to the explanatory Catalogues already published. They would merely observe that, on the evidence furnished by the Exhibition, there can be no doubt that the hardware manufactures of the United Kingdom are alone co-extensive with the wants, the comfort, and the conveniences of civilized life. In some countries refinement and taste are more amply provided for; but at a comparative sacrifice of the interests of the many. In other countries particular branches of industry of a useful and ornamental, and sometimes of a nseless though profitable kind are cultivated to a considerable extent; others appear to be entirely devoid of any industry but such as either supplies the mere necessaries of life, or ministers to the artificial and expensive wants of an aristocracy. In the United Kingdom alone industry has no exclusive bearing. Cheapness and abaudance for the many, are as much its rule, as splendour and costliness for the few. It alone exhibits an effort to meet every for the few. It alone expanse an enter to meet comfort, con-possible demand which taste, refinement, comfort, convenience, economy, or necessity can make upon it. The extent to which that effort has been specesful, in certain directions, admits of question; but that the effort has been, and continues with untiring energy to be, made, is beyond all doubt.

The following are the awards which have been made

by the Jury: I. THE COUNCIL MEDAL.

 Andre, J. P. V. (France, 1053, p. 1229).—The high excellence of the castings by André has already been n tied. The end of a bedated in cast-iron is considered, by the Jury to be one of the most faulties reasings in iron contributed to the Exhibition. The design is in good taste, and the sharpness and countness of the east-inc extremely perfect. A cast-iron fonatain in the East Nave is also a meritorious work; though it may be doubted whether cast-iron is a material untable for some hydrolige, protected from the action of water by some hydrolige.

2. AURANEL (France, 1055, p. 1229)—This exhibitor has given the highest evidence of his skill, in a group of nn Earle and Lamb, a hronae gilt chimmer-piece, and a gibled cast-iron door. The latter is extremely well designed and beautiful in exceution. These, and the above-mentioned works of André, evince with equal success the anolicability of cart-iron to artistic uses.

This production of p. 225(1).

The processes are the invention of Cultas, the bromass fainhead by the emptor Clesinger, cure fallows, completeness, and beauty of execution which place it in the first rank (Joint Medal with Class

AXVI.).

4. THE COALBROOK DALE COMPANY (641, pp. 659-661).

-The vast extent of the contributions by this Company, their variety and very general excellence, whether as objects of utility or ornament, seen to claim for them a

very prominent place in the awards of the Jury.
This Company, one of the oldest in Great British, carries on the largest manufacture of iron and iron trade in the wards, the works producing the almost Incredible amount of 2,000 tons aff mished iron per week.
On a small scale iron works seem to have existed in Coalbrook Dale from a remote period, but the records

maly rated to the reign of Charles II.

The works of the present proprietors date from the beginning of the last century, since which time they have gradually stationed their present magnitude. In other gradually stationed their present magnitude, in for waggoms, ever known in England, was hid down at these works; and its efficiency being proved, the finances at the top of the Dale were connected by railway with the foundary at the enter, and the line continued from which the prediction of Coalbreck Dale still continue to be send down the river in larges for export in the present of the coal to the

their several destinations.

In 1779, the Company had the merit of erecting the first iron bridge ever constructed in England, via., that over the Severa, near Madeley; the position of which was no advantageously chosen, that a populous and thriving market-town arose in the neighbourhood, and now bears the name of Ironbridge.

now bears the name of Properties.

The Company is besides remarkable for the introducion of improved modes of smelting, and economy in the manufacture of iron.

man be reduced to the Cashowsk Dale works, now of all odderpilons, were, and libent twelver years possible descriptions, were, and libent twelver years possible descriptions, were and libent twelver years possible descriptions. 9. The Royal Prussian Iron Foindry, at Berlin (Prussia, 271, p. 1064), has been already adverted to. 10. Societé de Minss et Fondraits de Zinc de la Vielle Montaone (Belgium 26, p. 1152) has already been mentioned with high commendation.

11. Struars and Sourse (102, p. 603)—The Jury have had occasion, in a previous part of this Ropert, to remain the precular beauty of work manship and prevent brilliars of effect, for which the contributions of this firm are distinguished. In this respect they stand pre-emissent; and more than say other, contributed to impart the highly-orate channeter which the atore-grate manufacture possesses at the prevent time. The grates exhibited by them are for the most part manufacture to the prevent time of the previous contribution of the prevent time. The grate exhibited by them are for the most part manufactured to the prevent time. The grate exhibited to a result part of the prevent time. The grates exhibited to the prevent time of the prevent time of the previous part of the prevent time. The grate exhibited the prevent time. The grate exhibited the prevent time of the prevent time of the prevent time of the prevent time. The prevent time of the prevent time of the prevent time of the prevent time. The prevent time of the prevent time of the prevent time of the prevent time. The prevent time of the prevent time of the prevent time of the prevent time. The prevent time of the prevent time of the prevent time of the prevent time.

the surface of the floor. In proportion as custom deviated

from the primitive practice of making the fire upon the bearth, it lessened the comfort arising from a proper dis-tribution of heat. When grates were placed so high as has until very recently been customary, the greater part of the heat evolved passed up the chimney, leaving the lower stratum of air (the coldest part of a room) in contact with the legs and feet. This is obviated by Sylvester's plan, which, besides, affords the advantages of greater cleanliness, and the facility with which the same grate can be adapted to burn either wood or coal. The netal plate on which the fire is made, extending as it does from the fire-place to the fender, admits of being highly ornamented; and Mesars. Starat and Smith have shown how skilfully they are able to take advantage of its capabilities in that respect.

The Jury have only to add with regard to this award and No. 6, that the fact of their having recommended the award of Council Medals to two exhibitors of articles in

the development of different qualities of beauty and ex-

eellence in their several productions.

12. R. W. WINTELD (373, pp. 639, 640).—Reference has already been made to the collection of brass-work contributed by this exhibitor, as displaying very perfect workmanship with a moderate amount of ornamentation; particularly in the manufacture of metallic bedsteads, for which he has earned a deservedly-high reputation. His improvement in the construction of these by means of a continuous post which obvintes unstendiness and loosening of the joints, is deserving of attention, as well as the twisted, spiral, and plain tapered pillars or tubes employed for that and other purposes, which are produced in a peculiarly ingenious manner, invented by one of the workness of the establishment.

This house has also had the merit of introducing the combination of plain opal or coloared glass with brass work, by which flowers, blossoms, huds, or leaves in the same branch of manufacture, must be assumed as eridence of a well-considered opinion that hoth exhibitous ornament, in the manufacture of cornice-pole ends, have pre-eminently distinguished themselves, though by

Section 11 Autor

APPENDIX.

(A).

Extract from Minutes of the Jury for Class XXIX.

" Messes. Hoffman and De La Rue report, that they have conferred with the Chairman and Jurors of Class XXII., from whom they learn that in the English and Foreign Sections there are no less than 46 exhibitors of lamps. As it is clearly impossible to examine and test experi-mentally so large a number of lamps, Messrs. Hoffman and De La Rue soggested that the Jury of Class XXII. should select three lamps unly which they considered night to be so tested. The Jury of Class XXII. explained that much difficulty might arise in such a selection on their parts, as the exhibitors whose productions were not tested might complain that justice was not done them. Messrs. Hoffman and De La Rue fully agree in this view, and therefore for the present leave the decision of the proper course to be pursued, to the Jury of Class XXII., expressing at the same time their willingness to aid them to the best of their ability in any experimental inquiry

(B).

REPORT OF SUB-JURY A. OF CLASS X. ON "BELLS."

which time will allow."

Bells, those Jurors of Class Xa., who attended for that purpose, have to submit the following Report:-

Bells eramined, June 4th, 1851.

MEARS.-A large bell (in key of F), excellent, MURPHY (Dublin).—A large bell of very fine tone. Mulerary (Dublin).—A large bell in the East Nave,

onnected with elock (said to have been "cast in tune"), Very fipe tone Hopers.-Four ship bells; good tope and powerful, The brass bell of remarkably pure and good tone, and of

great power. TATLON (Loughborough).—Two bells, excellent, WARNER.—Three bells. The middle one is of a very pure tone.

Peter and Faitsra (Netherlands) .- Bells with suspending apparatus. Good, though if considered as a scale of bells, some of them are not perfectly in tune.

F. Gaunt (Saxony).— A bell in East Nave. Very fine

F. Garnt (Sexony) .- A bell and frame, in gallery, Tone pure and good. Hopces (Dublin),-A large bell. Excellent.

The Jurors of Class XXII. having requested the upon by Class XA. as belonging to a certain class of assistance of the Jury, Class Xa., in the examination of musical instruments,

> (Signed) H. BISHOP, KRT., CHAIRMAN,

CLASS XXIII.
